FOREWORD

GENERAL SMUTS, in the course of the Rhodes Memorial Lecture which he delivered at Oxford in 1929, pointed out that Africa was developing under the control of a number of European powers, that different and often conflicting principles were being applied by them in the administrative, social, educational, and legal fields, and that nowhere was there any survey of what was taking place in Africa as a whole. He pleaded eloquently for the compilation of such a survey, which would include a review of the extent to which modern knowledge was being applied to African problems. As a result a committee (the names of whose members are given on p. vii) was formed to carry the project into execution. The Carnegie Corporation of New York, with characteristic vision, made its execution possible by a generous grant of funds, which was later supplemented by the Rhodes Trustees; and Lord Hailey, then Governor of the United Provinces in India, agreed to undertake the Directorship of the Survey, on his retirement from India.

Owing to claims upon his services by the Government of India, Lord Hailey was not free to begin his inquiries until the beginning of 1935, but certain preparatory researches were commissioned by the end of 1933. It had from the first been decided that the Survey, while giving all the information necessary for the appreciation of the problems under discussion, should treat the problems themselves in as objective a spirit as possible; that its weight should lie in the full statement of fact rather than in the expressions of opinions. The scale and the complexity of Africa's problems, however, which became clear to the Director during his year's tour in that continent, made it impracticable to limit the work to the preliminary general report originally contemplated. This expansion in the scope of the work has delayed the issue of the report of the Survey beyond the date at which the Committee had aimed, a delay which has been increased by the illness of the Director for some months during the winter of 1937 and the early part of the present year.

The Committee believe that Lord Hailey's Survey brings to the

problems of a continent which has excited at various times heroism, greed, pity, political passion, and a scramble for control, a clear and objective study of significant facts on a scale and of a quality never previously available. They believe that this volume will mark a new era in the history of that continent, not only from the quality of the work itself but because it will enable those who are responsible for policy to consider it in the light of the problems of Africa, south of the Sahara, as a whole. They wish to express their deep appreciation of the remarkable contribution, which Lord Hailey has made to the solution of African problems at a sacrifice of health, leisure, and time which it is difficult to assess, and to pay their tribute to the unremitting labour which his assistants on the Survey have contributed, and without which the task would never have been concluded. They are under special obligations to their Secretary, Miss Hilda Matheson, who has since 1933 taken a very important part in organizing the work of the Survey. The Committee hope that this comprehensive examination of African problems by persons specially qualified for the task will be studied by all who are connected with Africa, or who, as citizens of colonial powers, share responsibility for its right development.

While the Committee have from time to time discussed problems of the Survey with the Director, the scope and form of the report, and any expressions of opinion contained in it, are those of Lord Hailey himself. The recommendations contained in Chapter XXIV were, however, discussed with the Executive Committee, by whom they were endorsed. It should also be added that the Carnegie Corporation of New York are not to be understood as having any responsibility for statements made or views contained in it.

In conclusion, the Committee are greatly indebted to the Council of Chatham House for kindly acting as trustees for the funds of the Survey, for accommodating its staff, and for placing all the services and facilities of the Institute at their disposal.

LOTHIAN

AFRICAN RESEARCH SURVEY

GENERAL COMMITTEE

THE MOST HON. THE MARQUESS OF LOTHIAN, C.H. (*Chairman*)

HENRY CLAY, ESQ., *Economic Adviser to the Bank of England*

REGINALD COUPLAND, ESQ., C.I.E., *Beit Professor of Colonial History, Oxford*

LIONEL CURTIS, ESQ., *Fellow of All Souls College, Oxford*

SIR RICHARD GREGORY, BT., F.R.S., *Editor of Nature*

JULIAN S. HUXLEY, ESQ., F.R.S., D.SC., *Secretary, Zoological Society, London*

THE RIGHT HON. THE LORD LUGARD, G.C.M.G., C.B., D.S.O.

IVISON S. MACADAM, ESQ., C.B.E., M.V.O., *Secretary, Royal Institute of International Affairs*

DR. J. H. OLDHAM, *International Institute of African Languages and Cultures*

SIR JOHN ORR, D.S.O., M.C., F.R.S., *Director, Rowett Research Institute, Aberdeen*

SIR ARTHUR SALTER, K.C.B., *Gladstone Professor of Political Theory and Institutions, Oxford*

Director:

THE LORD HAILEY, G.C.S.I., G.C.I.E.

Secretary:

MISS HILDA MATHESON

THE APPROACH TO AFRICAN PROBLEMS

AS the *Foreword* to this volume has explained, the Survey has in some respects exceeded the scope of the suggestion made in General Smuts's lecture of 1929, to which it owes its origin. In the form which it has now taken, it is not limited to a discussion of the state of our knowledge regarding the problems which are involved in the development of Africa; it attempts also to describe the physical and social background out of which these problems have arisen, and to analyse the factors which, so far as can now be seen, must determine their solution.

In approaching a task of so wide a range, it has been necessary to place some limitation on the extent of the work involved. It was decided, in the first place, to confine the Survey to that part of Africa which may be roughly described as lying south of the Sahara. The intention of this decision was to exclude those areas of the continent which have come under Mediterranean littoral influences. It must be admitted, however, that in the result the line actually adopted as the northern limit of the Survey has been chosen largely as a matter of convenience, and does not correspond closely to political or ethnic distinctions. It runs along the northern boundary of the territories included in French West and French Equatorial Africa, the Congo, Uganda, and Kenya; the Survey does not, in consequence, include Ethiopia and other Italian possessions, or the Anglo-Egyptian Sudan. The exclusion of this last territory is regretted, since the problems of its southern area closely resemble those of Uganda and the north of French Equatorial Africa. The Survey has, again, been confined to the mainland, with the result that both Zanzibar and Madagascar fall outside its scope. Within the area which it covers, chief attention has been given to the Union of South Africa and the British, French, and Belgian colonies and mandated territories, partly because it is in these areas that the problems of development are most important, and partly owing to the lack of opportunity for more than a brief visit to the Portuguese possessions.

Moçambique and Angola consequently occupy a relatively unimportant place in the Survey. Liberia has been omitted.

In the second place it was decided that the treatment adopted should as far as possible be of a factual and objective character. It has, indeed, been felt that, apart from any question of limiting the scope of the work, there is some positive advantage in this course. The Survey ranges over an area in which a Dominion of the British Commonwealth and four European Powers are engaged in a common task, though in some respects with widely different methods of approach. In conditions of such diversity, generalization is more than usually dangerous, while any endeavour to assess the merits of policy or to judge of the manner of its application is liable to be treated as an attempt to satisfy one national outlook at the expense of another. The sole object for undertaking the Survey was the hope that it might prove of some service to the Powers which have possession of territories in Africa, and of some benefit to the African people. It has been felt that this purpose could best be served by a statement as largely as possible of a factual nature, so arranged as to enable the different administrations to appreciate the extent to which their problems are shared by their neighbours, and to inform themselves of the measures which are being taken to meet them. In such circumstances a comparative study of fact can possibly prove of greater value than an expression of opinion or an attempt at judgement, on whatever authority it may be made.

Statements of fact, however, are not only apt to be less arresting and more laborious than expressions of opinion, but involve their own difficulties and indeed their own hazards. Material of the nature of that for which this Survey has sought has to be collected from a great variety of sources; it is not always readily accessible, and there are, indeed, some administrations in Africa which practise a noticeable economy in making information available to the public. The Survey has proved to be something of a pioneer effort, and those who are responsible for the present volume are fully conscious that it must contain some mis-statements and many omissions. They have, however, preferred to publish it in its present form, rather than incur the delay which would be involved in any attempt to remove its defects. There will be found

later in the volume¹ a list of the many authorities who have generously given their help or advice at various stages of the Survey; they are responsible for any merits it may display, but not for any views, and still less for any errors, which it may contain. There are also some more general obligations which it is proper to acknowledge here. The Survey has had the benefit of the good offices of the Colonial Office in London, of the staff of the High Commissioner for South Africa, and of the Colonial Ministries in Paris, Brussels, and Lisbon. It is under a great obligation, often of a personal nature, to the Government of South Africa and to the heads of many of the African administrations, both British and non-British, and a large number of their officers. A full use has been made of the valuable material contained in Lord Lugard's classical work, *The Dual Mandate in British Tropical Africa*, and of Mr. R. L. Buell's two volumes, *The Native Problem in Africa*. In addition, much expert assistance has been received from M. Louwers, the secretary of the *Institut Colonial International* at Brussels, from the staff of the Libraries of the Colonial Office, the Royal Empire Society, South Africa House, and the Royal Institute of International Affairs, and from Sir Alan Pim, who has advised in detail on many of the chapters.

The claim made by Germany for the return of her former colonies has during recent years given occasion for much discussion regarding the value which may be attached, from one standpoint or another, to the possession of colonies. It is, however, possible that history, looking back in retrospect on the part played by Imperial Powers in Africa, will be more concerned with the nature of the contribution which the European occupation will have made to the future of the African peoples, than with the profit or loss which the African connexion may have brought to Europe. The share which colonial Africa takes in the total commerce of the world is less than might be supposed,² and her capacity for accommodating the surplus population of Europe is limited. On the other hand, the type of civilization which will

¹ See pp. 1665-6.

² Chap. XX, pp. 1324-5.

ultimately characterize the population of so considerable a portion of the earth's surface is a matter of great concern to the world at large. It is true that African temperament and character must in the long run largely determine the form which African civilization must take; but the pace and the direction of its evolution will be influenced by the nature of the social and political institutions which the policy of the Colonial Powers leads them to establish, and of the facilities for development which they provide.

This view of the character of the responsibility attaching to European Powers suggests two considerations which have a special bearing on the study made in this Survey. The present is possibly the most formative, and therefore the most critical period of African history. There are many areas in which little has been done beyond laying the foundations on which social development must be built up; the policy which is to be followed in creating the structure is now only beginning to take shape. In the second place, something more than the exhibition of a spirit of humanity or the sympathetic application of the routine of administration is needed for the adequate discharge of a responsibility of this character. The needs of Africa extend beyond the maintenance of order, the institution of courts of justice, or the prevention of oppressive action by native authorities or European employers of labour. It would not be correct to say that these, and similar elementary requirements of a civilized rule, are everywhere fully met; but it is possible to feel with some confidence that the improvement of the standards of administration, which has been a marked feature of recent years, will be progressively maintained in the future. The special needs of Africa at this stage are for a more comprehensive study of the factors which determine the nature of its social development, and a more scientific approach to the problems of health and material well-being to which its physical characteristics have given rise. The studies required for the solution of such problems as these can offer an unusual interest to those who undertake them. A considerable part of the activity of the intellectual world is expended to-day in the study of social institutions, systems of law, and political developments which can now only be examined in retrospect. But Africa presents itself as a living laboratory, in which the reward of study

may prove to be not merely the satisfaction of an intellectual impulse, but an effective addition to the welfare of a people.

A scientific approach to the questions of African development demands the study of problems of a social nature equally with those involving the application of the physical sciences. But all problems alike have one significant characteristic. No one question can be studied in isolation; there is a close interdependence among all the essential problems of Africa. It is unnecessary to dwell here on a fact of which every chapter of the Survey will furnish ample illustration.¹ But it follows that research into the problems of African development must always have something of the character of a co-operative undertaking.

An observer of British colonial administration, in addressing a British audience, has an advantage which is not always shared by inquirers from other countries. There is in Great Britain a large public whose serious interest in colonial affairs is based on some degree of knowledge, and sometimes indeed on an actual experience of their problems. It is not out of place to refer here, as a proof of the seriousness of this interest, to certain discussions which took place after the bulk of this volume was in print. The disturbances which occurred in some of the West Indian colonies, arising out of the conditions in which native labour is employed, gave occasion for some public discussion regarding the adequacy of the organization of the Colonial Office for the direction of colonial policy in modern conditions. It was realized that the Secretary of State has of late years had the assistance of a number of very competent advisory bodies, dealing with technical and scientific branches of administration.² But it was suggested that there is little evidence of a central direction of major lines of policy, of which the need is especially felt when colonial administrations are passing out of the stage at which their main occupation lies in the establishment of order or the provision of the more elementary social services. Some who joined in the

¹ See, for example, Chap. XXIV, pp. 1612, 1624.

² See Chap. VI, p. 161; Chap. XXIV, pp. 1626-7.

discussion suggested the institution of a Colonial Council, of the nature of the Council of the Secretary of State for India. Others considered that there was a lack of contact between the home authorities and the local administrations, which could best be remedied by the formal appointment of an inspectorate on the French model.¹ There were finally those who insisted that, in their phrase, the Colonial Empire could not be governed from Downing Street, and saw the balance of advantage in a maintenance of the tradition which gives to the heads of local administrations as wide a discretion as possible in the shaping of policy.

The 'Council of India' had an unusual position.² When India was transferred to the Crown in 1858 the actual experience of Indian affairs lay with the Court of Directors of the East India Company and its servants, for the Parliamentary Board of Control established in 1784 had little direct contact with Indian matters. In creating the Council, the Act of 1858 proposed partly to make that experience available to the Secretary of State (seven of the fifteen members of the first Council being elected by the Court of Directors), and partly to preserve in the management of Indian affairs an element which would be independent of political considerations. The Council was charged with the conduct of all Indian business transacted in the United Kingdom; the Secretary of State presided and, save in one respect, could overrule it. But the exception was important. All proposals for expenditure from Indian revenues required the concurrence of a majority of the Council. There were at the time those who viewed with apprehension the extent of the powers which were being given to the Secretary of State, and this provision secured that in one important range of matters neither he nor the British Government itself could overrule a majority of the Council. Up to the passing of the India Act of 1935, which replaced the Council by a body of Advisers to the India Office, it retained its powers over the sanction to be accorded to expenditure from Indian revenues. But in other respects its position underwent a gradual change. As the Council had no statutory responsibility for general policy, it was

¹ See Chap. VI, p. 188.

² For its history see *The Cambridge History of India*, vol. v, 1932, chap. xi; also *Report of Joint Committee on Indian Constitutional Reform, 1933-4*, p. 225.

not necessarily consulted on it, and the influence which it exercised varied greatly from time to time with the personality of the Secretary of State.

The circumstances in which the proposed Colonial Council would operate differ widely from those which prompted the creation of the Council of India. It is indeed open to doubt whether the advice obtainable from a Colonial Council would have greater value than that which, in modern conditions, is readily available to the Secretary of State from the heads of colonial administrations or from the advisory bodies appointed by him. The situation would appear rather to need the provision of means by which colonial affairs can come under the systematic review of a body of informed non-official opinion. The Belgian *Conseil Colonial* occurs as a precedent, but it is only partly relevant, since the *Conseil* is consulted only on legislative proposals, and on the budget of the Congo.¹ The *Conseil* is, moreover, a non-parliamentary body, and all experience, including that of the Council of India itself, shows that in Great Britain it is difficult to allow to a non-parliamentary body any formal right to deal with policy for which a Secretary of State is ultimately responsible to Parliament. On this view, the only body competent to fulfil the function indicated appears to be a Standing Committee of the Houses of Parliament, specifically charged to report periodically on the affairs of each colony or protectorate, on the basis of the official reports or any other public material brought to the Committee's notice. Such a body might also, following the procedure of the Permanent Mandates Commission,² examine representatives nominated by the Colonial Office to appear before it in order to explain matters arising out of the reports.

It is true that there is no exact precedent for a committee of this character. In the eighteenth century the inquests conducted by select committees of the Commons before every renewal of the East India Company's charter had an acknowledged place in the development of British policy in India.³ These inquests ceased after 1858, but a function of similar importance was performed by

¹ See Chap. VI, p. 207.

² *Ibid.*, p. 218.

³ See the 'Montagu-Chelmsford' Report on Indian Constitutional Reform, Cd. 9109, p. 30.

the Joint Committees which examined the projects for Indian reform in 1919 and again in 1933-4. All such committees were, however, specially appointed for the purpose, and were not of the nature of standing committees. The Standing Joint Committee on Indian affairs, appointed as the result of the legislation of 1919,¹ had at first somewhat wide terms of reference. It was not to confine itself to matters referred to it by the Secretary of State or Parliament, but was to consider and report on matters brought to its notice by its chairman or members. This body affords, perhaps, the nearest analogy to the suggested standing committee on colonial matters, though it was not charged with making the periodic review which would form part of the functions of the latter body. Its terms of reference were, however, found to be an embarrassment, and in 1924 the Committee was charged to consider only the matters referred to it by Parliament or the Secretary of State. It made a number of such reports during the early years of its existence, but it ceased to function actively after 1925; it was not reappointed after 1928. So far, therefore, as the Committee constituted a precedent, its experience seems to point clearly to one conclusion. A Standing Colonial Committee would be of little value, unless Parliament specifically charged it with the duty to report at stated intervals on the affairs of each colony, on the basis of material which it would be the formal duty of the Colonial Office to present to it.

¹ See the 'Montagu-Chelmsford' Report on Indian Constitutional Reform, Cd. 9109, p. 236.

CHAPTER I

THE PHYSICAL BACKGROUND

I. GENERAL DESCRIPTION

THE history of every continent is written clearly in its geographical features, but of no continent is this more true than of Africa. That it should have remained the 'dark continent' until so late a period of history finds a ready explanation in its physical characteristics. The greater part of its coast-line has little safe harbourage, and its rivers afford no easy access to the interior; the larger of them are blocked by sand bars, and it is only the Congo which has an estuary of deep water. On both the east and the west, thousand-mile stretches of sand-barred, surf-beaten coast are to be found, and the high cost of artificial harbour works, such as Takoradi or Beira, reflects the difficulties which retarded the early penetration of the continent. Similarly, if we seek an explanation of the long story of tribal migration in the central, eastern, and southern areas, with its consequences in the absence of stability of settlement, and lack of any continuous history, we must again look to the physical background. Over immense areas the African soil lacks the constituents which make possible a continuous occupation for agricultural or even pastoral purposes; 'shifting cultivation'¹ is less a device of barbarism than a concession to the character of a soil which needs long periods for recovery and regeneration; and the trekking habit, whether of Dutch farmers or African tribes, has been due to the requirements of that 'extensive' system of occupation which the character of the soil has seemed to demand. Again, the feature of Africa which impresses itself most definitely on every modern observer is its relative lack of population. Figures of density of population as applied to large areas are apt to be deceptive and must be used with discretion; in making comparisons it is necessary to exclude those areas which are not suited to beneficial human occupation, nor can one profitably compare the population density² of industrialized countries with those which are mainly agricultural or pastoral. But though there

¹ See Chap. XIII, p. 878.

² See Chap. IV, pp. 104-9.

are in Africa some small blocks which are exceptionally well populated, there is nowhere any considerable area which contains a density of population in any way comparable to that of India, Indo-China, the Netherlands Indies, or many of the non-industrialized areas of Europe. The figure for the Union of South Africa generally is 20·3 per square mile; that of its most favoured native area, the Transkei,¹ is calculated at 58·1. The general figure for Southern Rhodesia is 8·6; among the predominantly native areas, Uganda has 39, Tanganyika 14·3, the Belgian Congo 12·1, Northern Nigeria 40·1, Southern Nigeria 96·9, French West Africa (excluding the lightly populated Sudan province) 8·9. The general figure for British India is 200, for Indo-China 81·5, for Java 817·5. In Europe comparable figures for predominantly agricultural countries are: France 197, Hungary 249·2, Yugoslavia 156·4. An explanation of the general low density of population has sometimes been sought in incidents such as the ravages of war or of the slave trade, and it has again been ascribed to the unusual prevalence of human and animal disease. But save for the exceptional depredations of tyrants such as Chaka, it is doubtful if there has been in Africa generally any unusual loss of life due to tribal warfare; the most destructive period of the slave trade was of relatively short duration; and a high prevalence of human and animal disease is itself the result of malnutrition associated with poverty of physical conditions.

We are driven to the conclusion that the low density of population over many parts of Africa is a symptom of a physical configuration which is unfavourable to the rapid growth of the human race; and it may be added that all experience has shown that a remedy is not to be found merely in the introduction of law and order, the spread of communications, or the routine application of existing knowledge of sanitary and agricultural science. If Africa is to be rendered capable of supporting a large settled population, with adequate standards of living, the result can only be attained by the study of the remedies applicable to her unusual needs.

The following pages of this chapter give an outline of the physical features of the area with which this Survey deals, and treat of

¹ See Chap. XII, p. 806.

certain administrative aspects of work, such as mapping or the study of meteorology, which are in varying degrees necessary to its development.

In general elevation and relief the country discussed in this volume falls into three broad sections.¹

1. The north-west, extending from the Guinea lands to the western edge of the Abyssinian plateau and south into the Congo, consists of a series of relatively small highland blocks—the Futa Jallon, the Bauchi plateau, and the Cameroons—interposed between wide basins. The middle Niger basin in the region of the great bend was formerly an area of inland drainage, and the river, still flowing sluggishly in this section, floods into many adjacent depressions every summer. An earlier stage of the same process is found to the east, where the headwaters of the Benue are slowly cutting back the low divide separating them from the basin in which the waters of the Shari system still empty into the enormous swamp of Chad. A third basin to the east has a northern outlet by which the waters of the Bahr-el-Ghazal and the Sobat, passing through vast swamps, emerge to the Nile. To the south lies the Congo basin, formerly the floor of an elevated lake, in which extensive summer flooding is found. Its main rivers swing round in a curve before they converge to enter the gorge and rapids which render the Congo unnavigable for 150 miles.

2. The eastern highland area, in which great massifs at general elevations of over 5,000 feet are found, presents the most extensive example of recent earth movements, resulting in broad uplifts with linear fractures along which volcanic extrusion has thrown up a series of eruptive cones. This area is characterized by large blocks of highland and giant cracks of the rift valley system which extends at varying elevations from the Jordan valley and the Red Sea to the Shire river.²

South of the Abyssinian highland, and separated by a low but arid belt, is the highland of the Great Lakes. Its flanks are traversed by the two limbs of the rift system which contains a string of lakes and converges on Lake Nyasa in the south. In the heart

¹ For general geography of Africa see W. Fitzgerald, *Africa: a Social, Economic and Political Geography of its Major Regions*, 1934.

² J. W. Gregory, *The Rift Valleys and Geology of East Africa*, 1921.

of this area is the Victoria Nyanza, the first reservoir of Nile waters. The highlands are sufficiently lofty (average elevations are over 6,000 feet) to mitigate the climatic effects of equatorial latitude, and the more accessible eastern area in central Kenya and Tanganyika has been the scene of the only considerable white settlement in equatorial Africa.

3. The southern lobe of Africa is a broad high central basin (Barotseland and Bechuanaland) occupied by the Zambesi and Limpopo river systems. At its corners lie four high plateaux, those of Angola, Southern Rhodesia, South West Africa, and South Africa. The last, lying almost entirely south of the Tropic, rises steeply from a narrow coastal plain to culminate in the escarpment of the Drakensberg and the highlands of Basutoland. Across its westward sloping surface, the high veld of the Transvaal and Orange Free State, the Vaal and Orange river system carries the waters of the east through the Kalahari desert to the Atlantic Ocean.

II. SURVEY AND MAPPING

(a) *General Problems*

The extent of our knowledge of the topography of these areas is explained in chapter II of *Science in Africa* issued in association with this Report. It may be said that, with few exceptions, the governments with which we are concerned have adequate topographical material for the more elementary purposes of administration, but there is great inequality in the extent to which they are provided with the material needed for the application of those services which are the increasing occupation of more advanced types of government. Administrations as poor as many of those in Africa may well be excused for considering the expenditure on these services from the point of view of minimum rather than of maximum standards; and there has been in some areas a tendency to postpone survey and mapping in favour of other work calculated to produce more immediate tangible results, or to confine detailed survey to mineral areas, or lands set apart for European settlement. It is obvious, however, that accurate mapping is an indispensable basis not merely for work aiming at material improvement, such as forestry and agriculture, but for

the handling of many social problems, such as those connected with health or the requirements of a land policy suited to the conditions of native Africa. It is indeed possible to quote more than one instance where the lack of topographical knowledge has been attended with serious results; thus a bridge appears to have been built in Northern Rhodesia eleven miles from its correct site, owing to the use of an out-of-date map, and the railway from Sekondi to Kumasi, constructed without an adequate survey, had to be realigned at a cost approaching £2,000,000. It was estimated in 1921 that the lack of accurate topographic maps involved the South African farming community in unnecessary expense, on farm surveys alone, of £50,000 a year.¹

(b) Organization

Looking to the present requirements of the territories with which this Report is concerned, a point of first importance seems to be the need for a more definite co-ordination of survey work in certain of the British dependencies. In these territories the survey departments are supported and controlled by individual governments; their duties cover geodetic, topographical, and cadastral survey, and town planning. A Colonial Office Survey Committee advises on the correlation of work; but it is true to say that the progress and character of the survey depend mainly on local resources and initiative. Some measure of intercolonial organization would seem necessary if the geodetic and topographic surveys of the British dependencies are to be planned and carried out on economic and efficient lines. Suggestions have indeed been put forward for an Imperial Geodetic Department on the lines of the Hydrographic Department of the Admiralty.² Whatever may be the case for these proposals, it seems probable that a central department for trigonometrical survey could be established successfully for the group of territories comprising Northern Rhodesia, Nyasaland, Tanganyika, Kenya, and Uganda.³

The Union, faced with a similar problem, has established the

¹ *Report of the Survey Commission*, U.G. 39, 1921, para. ii. 5.

² See M. N. MacLeod and others in Conference of Empire Survey Officers, *Report of Proceedings*, 1935.

³ E. B. Worthington, *Science in Africa*, 1938, chap. ii.

Trigonometrical Survey for the whole country, leaving only property surveys to the Survey Departments of the four provinces, the Cape, Natal, Transvaal, and the Orange Free State.¹ The four Surveyors-General are members of a board which has advisory functions in matters of the general policy of the Trigonometrical Survey.

The French survey service in Africa is grouped in large regional units and has a central organization in the Service Géographique de l'Armée in Paris.² This organization is making consistent progress on a comprehensive plan of geodetic and topographic work. Cadastral survey is carried out only in large urban areas. Under the Belgian system the direction of field work comes from an office at the Ministère des Colonies in Brussels. It seems that this centralization has resulted in stress being laid on major triangulation and the publication of topographic maps. A department for geographical and scientific investigation was recently inaugurated in the Ministry of Colonies at Lisbon, so that a centre now exists for the co-ordination of local survey establishments.

The view has been widely held that surveys should rank equally in importance with other heavy development work which is normally executed from loan funds. At the Conference of Empire Survey Officers in London in 1931 a resolution was passed that 'consideration should be given to the employment of loan funds for the immediate provision of an adequate and permanent controlling framework in all Colonies where such does not already exist, or is incomplete'. This resolution received the approval of the Colonial Office. If loan funds are used, however, expenditure requires to be evenly distributed over a term of years, for survey work depends upon trained personnel with experience of local conditions; qualified staff cannot be assembled at short notice, nor disbanded without wasting valuable knowledge.

(c) *Geodetic Survey*

A further point of importance, and one affecting all the territories concerned, is the nature of the measures to be taken for the provision of an adequate geodetic framework for the mapping of

¹ Union of South Africa Land Survey Act, 1927.

² E. de Martonne, *Cartographie coloniale*, 1935.

the continent as a whole. This is an essential condition if the survey work of each country is to go forward without loss of speed and accuracy. Eventually it will be necessary to survey geodetically two or three meridional chains and at least as many parallels of latitude, cutting across all international boundaries. The work which demands the most urgent attention, however, is the completion of the arc of the 30th meridian, which extends across Africa from Alexandria to the coast near the boundary between Cape Province and Natal. The section from Cape Province to the Zambesi was completed at the beginning of the century under Sir David Gill. The triangulation was continued and, deviating slightly to the east of longitude 30° , reached the northern boundary of Northern Rhodesia in 1907. As far as Kigoma the work was carried out by a Royal Engineer team under Major Hotine in 1931-3. The Tanganyika Survey Department then continued the triangulation northward, deviating to the east where the arc passes through Belgian mandated territory, and linked up with the Uganda system. The computations following this latter operation are not yet finished, and some field work is outstanding, but these matters are in hand. From about 1° of north latitude there is a large gap comprising a small piece of Northern Uganda and the whole of the Sudan as far as the Egyptian border. The Egyptian sector was completed in 1930. The Anglo-Egyptian Sudan is at present engaged on the northern portion of the arc, adjoining Egypt. The filling of these gaps should not present serious difficulties of terrain except where the line cuts through the Sudd area of the Sudan, which is impossible country for triangulation. Deviation will therefore be necessary. A complete circuit round both sides of the Sudd is regarded as the best method, but valuable results could be achieved by deviating to the east along the Abyssinian-Sudan frontier, and thus incidentally providing a geodetic basis for fixing this boundary.

The provision of an adequate and controlling geodetic framework has been more consistently pursued by the French and Belgians than by the British. This seems to have been due largely to the preoccupation of the British with cadastral survey, needed for urgent development projects. For this purpose personnel has too often been withdrawn from unfinished triangulations. It may

be noted that African conditions emphasize the special need for upkeep. The need for annual maintenance applies not only to property surveys, but to geodetic and topographic work. The topographic survey of the Orange Free State, though excellently carried out, had to be done again after only fifteen years because no provision had been made for the maintenance of beacons or for keeping the maps up to date.

(d) Cadastral and Topographical Survey

The extent of detailed cadastral and topographical survey has varied in accordance with the policy observed in regard to land or mineral development. Thus the pursuance of a policy of European settlement in the Union of South Africa, Southern Rhodesia, and Kenya has attached particular importance to a cadastral survey; the grant of quasi-freehold on the Mailo lands has necessitated a large measure of detailed survey over a considerable part of Uganda;¹ the Union Minière du Haut-Katanga has led to the execution of one of the most complete topographical surveys of large areas as yet effected in Africa. There will be found in Chapter XII some considerations as to the extent to which future developments of land policy may necessitate a cadastral survey in predominantly native territories. At the moment, it may be said that the chief requirement in regard to the cadastral surveys hitherto effected is the linking up of independent surveys with some common system of triangulation. It may be added that the need for accurate cadastral work is perhaps more necessary in Africa than in developed countries where hedges, dykes, and many prominent landmarks help the surveyor, and where streams are held permanently to one course by artificial means. In Africa, where landmarks may be few, where streams may carve out new gullies for themselves, where tracks constantly change their alignment, a high degree of accuracy is required from the property surveyor.

(e) Methods of Projection

Various systems of projection have been used for mapping in Africa, and in some cases local projections have been worked

¹ See Chap. XII, p. 851.

out to suit special needs. As, however, the triangulations of the different territories begin to interlock, and as property surveys come into a rigid framework, it is desirable to have an agreed system of projection for the continent as a whole; otherwise a vast amount of redrawing of maps will be necessary, and inconvenience will be caused when the maps of adjoining territories have to be used in conjunction. After the Conference of Empire Survey Officers in 1931 and again in 1935, Brigadier MacLeod put forward a method for projection of the 1 : 250,000 map series, whereby the whole of Africa is divided into meridional belts each representing six degrees of longitude. Commandant Maury, the survey expert of the Ministère des Colonies in Brussels, has already used a somewhat similar scheme for projection by dividing part of the Belgian Congo into meridional belts. If a unified system were to be adopted in the near future, enormous expense would be saved.

It is a serious handicap to the co-ordination of surveys in Africa that British measurements are in feet, while all other authorities use the metre. There are strong reasons for the view that it would be in the interest of the British territories themselves to adopt a unit of length which is not only scientific but also international.¹

The need for expanding survey work has stimulated the employment of Africans for surveying. In the Gold Coast the Government employs 45 African surveyors who do all the field work, with the exception of the main triangulation and the observation of astro-radio points; they were trained in a survey course of three years organized by the Department. A large number of men trained at this school sat for the Licensed Surveyors' Examination,² and now undertake individual property work for mining concessions and other private clients. In the Nigerian Department there are 43 African surveyors, 40 draftsmen, and 7 lithographers. It is a noteworthy fact that Kano, one of the Native Administrations in Nigeria, has its own Survey Department. In British East Africa there was a training course for African plane-tableers at Makerere College in Uganda, but at present the only survey course is that recently opened by the Tanganyika Depart-

¹ M. N. MacLeod, 'Co-ordination of African Surveys', Conference of Empire Survey Officers, *Report of Proceedings*, 1935, pp. 142, 143.

² E. B. Worthington, *op. cit.*, chap. ii.

ment. This school receives support from the Zanzibar Government, which sends boys to Tanganyika to be trained.¹ Under the French organization most of the work of drawing, computing, and printing is carried out by African subordinate staff.

(f) *Air Survey*

The development of air survey has led to suggestions that the persistence in older methods may be an expensive anachronism. The subject is under constant review by the British Air Survey Committee, which includes representatives of the various interested Government Departments. Experience in Africa seems to show that in certain cases the aerial photograph has definite advantages, especially in precipitous country or on broken land covered with vegetation. A particular case of the latter is swamp land; for instance, the Sudd area of the Sudan, which presents insuperable obstacles to ground survey, has been efficiently surveyed from the air by a commercial company on behalf of the Egyptian Government in connexion with the project for deviating the waters of the Bahr-el-Jebel.

Photographs taken from the air have uses besides that of map-making, for trained examiners can detect in them much which is of value in connexion with the alignment of communications, afforestation,² the appreciation of the nature of soils and vegetation, of the proportion of land under cultivation, or many of the details required in tsetse control work.³ Much of the information which can be ascertained in this way is unobtainable by any other means.

At the same time it is clear that air survey, in spite of technical developments, is not likely in the future to be able to replace triangulation, and a certain measure of ground control will always be necessary to obtain fixed points. Again, contours plotted from air photographs cannot compete in accuracy with ground work.

The cartographical stages of aerial survey are slow, for distortions caused by tilt or by inequalities in the height of the land have to be corrected by long processes. Since the cost of draftsmen able to make maps from air photographs may be as high as, or higher

¹ *Report of the Commission on Higher Education in East Africa*, Colonial no. 142, 1937, p. 109.

² See Chap. XIV, p. 1011.

³ M. Hotine, *Surveying from Air Photographs*, 1931; Air Survey Committee, *Second Report*, 1935.

than, that of plane-tablers who work in the field, claims on behalf of air survey for greater speed or lower cost should be put forward with caution; the decision must in each case rest on consideration of the type of country to be surveyed, and the nature of the results required. At present the facilities for air survey in the British territories in Africa consist of those provided by a number of commercial firms and of the air survey section maintained by the Government of Tanganyika since 1931. The companies have done useful work both for governments and for mining interests,¹ but where they have worked on private charter the results have in some instances unfortunately not been available to the governments for some years. The Tanganyika Government's air survey section has made surveys of all the townships in the territory, and carried out a survey for the Government of Zanzibar in 1934 for town planning and cadastral purposes.² In French West Africa considerable areas have been surveyed from the air with success. The Compagnie Aérienne Française carried out a survey of the lower Belgian Congo, and a small corner of Katanga has also been surveyed from the air.

III. CLIMATE AND VEGETATION

A continent which stretches for 5,000 miles from the Mediterranean southwards across the Equator to 35 degrees south, and for 4,500 miles from Dakar in the west to Guardafui in the east, naturally exhibits a wide variety in climate and in vegetation. But the great mass of Africa lies in the tropics; it is only in the north-western and southern extremities and in a few areas of high altitude that temperate climates exist. It may be possible to ski close to the line of the equator on the slopes of Mt. Kenya, or to find a perfect winter climate in South Africa; but, taken as a whole, Africa is the most tropical of the continents, and it is only a relatively small area which offers conditions comparable to those of Europe, or has proved suitable for European settlement.

In equatorial latitudes the sun, which is vertically overhead at midday twice a year and never declines more than 25° from the

¹ H. Hemming, 'Aircraft in relation to Petroleum Technology: Use for Survey and Transport', *Journal of the Royal Aeronautical Society*, 1934, no. 37, p. 274, and 'The Use of Air Photography for Surveying and Economic Development', *Photographic Journal*, 1934, no. 74.

² Tanganyika Territory, Survey Department, *Annual Report*, 1934.

zenith, maintains a high temperature with only small variations throughout the year. The movements in the heated surface layers of the atmosphere bring rain at all seasons, but this tends to be greatest in the periods immediately following the equinoctial maxima of insolation. In such areas with an annual rainfall of over 60 inches per annum and no period of real drought, evergreen forest of dense undergrowth is developed.

On either side of the equatorial zone are belts six or seven hundred miles wide in which highest temperature and precipitation occur once a year in the summer season. But while summer temperatures higher than those of equatorial latitudes are experienced as far as the tropics of Cancer and Capricorn, the amount of the summer rainfall diminishes rapidly with increasing distance from the equator, and the duration of the wet season shrinks from eight or nine to less than three months. The savannah vegetation of these belts thus grades from luxuriant tropical grassland studded with trees and threaded by forested river valleys to acacia scrublands with an incomplete cover of wiry grass. Beyond these lie the bare surfaces of rock, gravel, and sand in the true desert areas of the country extending for 10° on either side of the northern and southern tropics, where drought has spread over the entire year.

The Sahara becomes an area of low atmospheric pressure under the heat of the northern summer. Streams of humid air from the Gulf of Guinea are in consequence drawn across the equator at this season as rain-bearing south-west winds, which extend the limits of heavy rainfall and dense forest to the West African coast. Where the monsoonal air stream meets the highland areas rainfall is heavier than at the equator, and the highest annual precipitations in Africa occur on the seaward slopes of the Futa Jallon plateau in Sierra Leone and Liberia and of the Cameroon highlands at the eastern end of the Gulf. Freetown has a mean annual rainfall of 174 inches, though averages for stations near the equator in the Congo basin do not exceed 65 inches. The mean annual fall on the western face of Cameroon mountain probably reaches 400 inches and 577 inches were recorded in 1919.¹

On the north-eastern side of the continent, owing to the absence

¹ E. B. Worthington, *op. cit.*, chap. iv.

of a normal trade wind climate, desert conditions extend to the coast. The rainfall in equatorial latitudes in the east is also reduced, probably on account of water vapour drawn off by the atmospheric circulation set up in the Indian Ocean by the summer low pressures of south-western Asia. A desert tongue extends south through the Horn of Africa and along the coast as far as the equator itself, while the highlands of East Africa have a moderate precipitation of 25 to 50 inches, which is generally insufficient for the development of dense forest.¹

From about 15° S., the trade winds of the south Indian Ocean, reinforced in summer by the low pressures of the interior, give a prolonged season of summer rain to the eastern coastlands; but the strong relief barrier of the plateau margins in this part of Africa confine heavy precipitation (over 40 inches) and the development of forest to the coast. Severe aridity is restricted to the far west, however, and desert conditions, which in Northern Africa extend from east to west, are in the south confined to a strip on the western coast.

In South Africa the plateau in the lee of the Drakensberg escarpment is sufficiently protected to have become an extra-tropical extension of the high veld. Rainfall diminishes westwards to less than 10 inches in the scrublands of Namaqualand. Woodland is encountered only in the south-western margins of Cape Province which come within the westerly cyclonic belt in the southern winter and have a climate of Mediterranean type.² A crescent of grasslands thus flanks the rain forests of Africa and extends southwards to within a few miles of the southern coasts. This has been of great significance in the occupation of the African continent, for the two wings running west through the Sudan and south through the eastern and south-eastern plateaux have been the main avenues of human migration.³

There is some evidence that mean annual temperatures in tropical Africa tend to vary in relation to the eleven-year sunspot cycle by about 1° F. from sunspot maximum to sunspot minimum. It is also claimed that evaporation is substantially greater at sunspot

¹ C. E. P. Brooks, 'The Distribution of Rainfall over Uganda, with a note on Kenya Colony', *Journal of the Royal Meteorological Society*, 1924, no. 50.

² F. E. Plummer, *Aspects of Rainfall in Western Cape Province: a Basis for Geographical and Agricultural Study*, 1932.

³ A. de Préville, *Les Sociétés africaines*, 1894.

minimum. According to some authorities, the sunspot cycle is felt with particular intensity in the East African region, where its influence on the rate of evaporation is reflected in the rise and fall of the levels of the great lakes. The highest levels have been recorded at intervals of eleven years coinciding with sunspot maxima.¹ The connexion between lake levels and sunspots cannot, however, yet be regarded as established.²

The possibility that variations in rainfall might correspond with the sunspot cycle has also been considered. The fifty-year record at Dakar shows a striking correspondence,³ but this appears to be the only case on record. It has been suggested that the sunspot cycle influences plant growth and is also reflected in numerous human problems; there is, for example, some evidence also that the great outbreaks of locusts have followed the same cycle. On none of these points, however, is there material which would allow any definite conclusion to be drawn.

Equal doubt surrounds the theory, to which some prominence has been given of late years, that there is a cyclical change of climate now in progress in Africa. It is clear that during early pluvial phases the Sahara and parts of Eastern Africa that are now arid were generally humid, fertile, and populous; and it has been claimed that there is to-day a period of growing desiccation throughout large areas in Africa. There is in particular some evidence that the Sahara is making advances along its southern border. The evidence on this latter point is not yet accepted as conclusive: and it is also possible that the Sahara constitutes a special case, which has to be considered separately from theories relating to the general growth of desiccation. It may be said that most exponents of the theory of desiccation ascribe it to changes in the drainage rather than to climate; that is to say, that as a result of headward erosion reservoirs of water which have been held on the continent by the encircling rim of hills are being increasingly tapped by the head waters of streams which find their way through those hills to the sea. The destruction of forests and other vegetational cover by human agency has undoubtedly promoted local

³ L. Welter, 'La pluie à Dakar et l'activité solaire', *Bulletin commercial de l'A.O.F.*, 1931.

desiccation in large areas, but careful examination of long rainfall records fails to reveal any significant evidence to support the view that mean annual rainfall in any considerable part of Africa is diminishing.

IV. CLIMATOLOGY AND METEOROLOGY

The need by air communications of accurate information regarding weather conditions has prompted a great extension of meteorological work in Africa. As regards the South African region, there is a radio exchange of synoptic reports between the Union of South Africa, Southern Rhodesia, Northern Rhodesia, Moçambique, and Madagascar. The meteorological service of South-West Africa is not centralized under the Union organization, although the meteorological office of the Irrigation Department at Pretoria collects and publishes data from the High Commission territories.¹ The provision of information for aviation² in South-West Africa and Angola appears to be inadequate, but Moçambique has a meteorological service which is in some respects a model.

The meteorological service of British East Africa was established in 1929. It covers Kenya, Uganda, Tanganyika, Zanzibar, and Northern Rhodesia, and is supported by these governments, together with Egypt and the Sudan, which are interested in the rainfall of East Africa. Nyasaland is not within the scheme. Although the East African service is co-ordinated with its neighbours north and south, there appears to be a need for a better system of wireless communication with the Congo.³

A meteorological service was established for the Belgian Congo in 1911 under the Institut Royal Colonial Belge, but it appears that the organization is deficient in its wireless communication, particularly in regard to collaboration with the French to the north-west and with the British to the east.⁴

Nigeria has a service organized by the Surveyor-General, and the extension of Imperial Airways to Kano in 1935 revealed new needs which have been met by reorganization and the opening of new stations. In the Gold Coast the Agriculture Department is

¹ Basutoland, Bechuanaland, and Swaziland.

² E. B. Worthington, *op. cit.*, chap. i.

³ *Ibid.*

⁴ *Ibid.*

responsible for recording rainfall, and some of its observation stations collect data regarding temperature, pressure, humidity, and winds, but to meet the needs of aviation two stations have recently been established under the Survey Department. The division of meteorology into two sections administered by different departments seems somewhat unsatisfactory, but it is expected that with the further development of airways it will be necessary to establish a unified meteorological service in all the British territories of West Africa.¹ British West Africa as a whole is one of the few quarters of the habitable globe where data regarding pressure systems are not available, though this state of affairs is being remedied by the new stations. Comparatively few of the existing stations are in the parts of the northern territories where data on rainfall are most needed.

French West and Equatorial Africa and the French Cameroons have a meteorological organization which was laid down by decree in April 1929. The service in West Africa was established in 1931, and that in Equatorial Africa in 1935. Portuguese Guinea and Liberia have no regular meteorological service.

Only a start has been made in the collection of meteorological data in Africa and in the establishment of uniform international methods of recording them. It is difficult to secure co-ordination of methods when the collection of data is entrusted in different territories to authorities whose point of view varies considerably. It is interesting to note that in 1936 there met at Lusaka for the first time Regional Commission No. 1 of the Office Météorologique International; the holding of such meetings should be of great assistance in achieving uniformity and rapid exchange of data.

Apart from the collection of purely meteorological data, there are some points within the field of climatology in which research is likely to yield valuable results. From the point of view of plants and insects, the important climatic factor is not the mean average over wide areas, but conditions in a particular cubic metre of atmosphere overlying the soil. This is known as the eco-climate. Since it has been shown that the temperature of the outer leaves of a coffee bush may in some cases be as much as 7° C. below the

¹ E. B. Worthington, *op. cit.*, chap. i.

minimum recorded on the meteorological screen,¹ it will be realized that the study of eco-climates is of great importance. Moreover, changes in climate from hour to hour and day to day may be of as much importance to plants and insects as seasonal changes. In relation to tsetse fly and other insect pests, this study promises useful results.

Another field for research of special importance in Africa is that of evaporation rates; it is of limited value to know how much water comes down if it is not possible to set against this the quantity of water that goes up. Scientists have, however, not yet reached agreement on a satisfactory uniform system of recording evaporation.²

As regards the effect of climate on health, there are factors about which little is known and on which further research is needed.³ Light and direct radiation are elements of climate which may be as important for health as heat, humidity, and wind, but the knowledge of radiations, especially in the tropics, is scanty. For instance, it is not yet possible to say what kind of radiation is responsible for tropical sunstroke.⁴ Experiments with air-conditioned rooms, which are yet in their early stages, may possibly have an important bearing on the health of Europeans in Africa.

CHAPTER I

THE AFRICAN PEOPLES

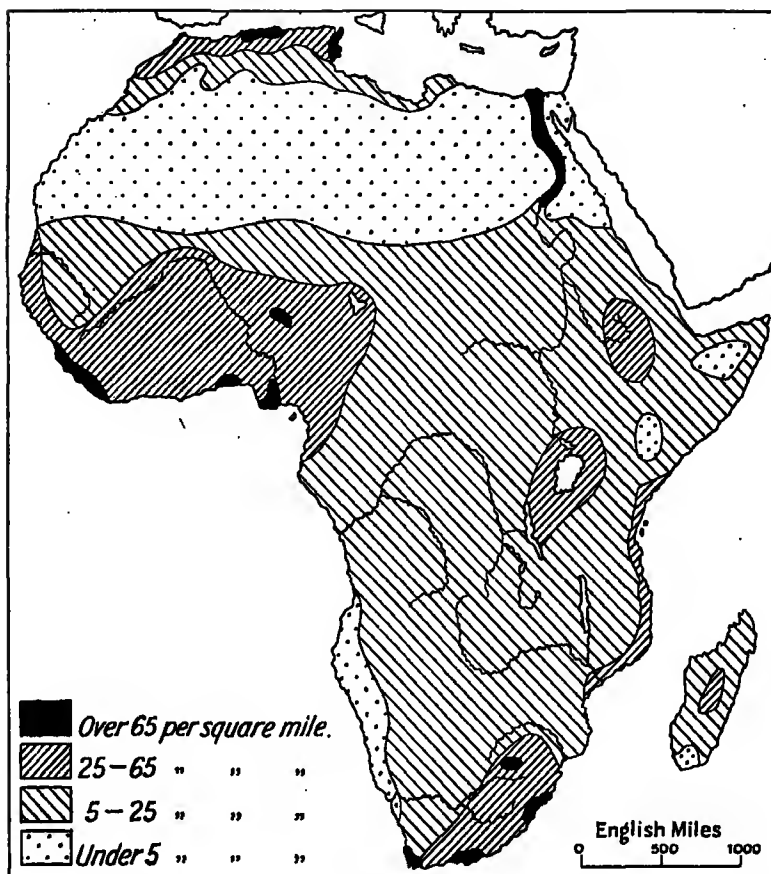

I. GENERAL DESCRIPTION

THE peoples of Africa are believed to have been derived from three principal stocks—Bushman, Negro, and Hamite.¹ With each of these stocks a characteristic physical type is commonly associated; but there are few parts of the continent in which adequate surveys of the physical characters of the inhabitants have been made, and it is therefore impossible to classify the different tribes accurately on such a basis. Thus it is inevitable that language and culture traits should be used as a basis for ethnic classification, however unsatisfactory this may be from a scientific point of view; it is noteworthy that the term Bantu, used to describe one of the largest groups of African peoples, has a purely linguistic significance. It is, of course, true that there is some correlation between physical type, language, and social form, and that it is possible to speak of a typical Negro language, or of a custom commonly associated with Hamitic peoples; but centuries of migration, intermarriage, conquest, and the intrusion of foreign elements have prevented much isolation of fixed types, and except for less accessible regions, such as parts of Abyssinia, the Kalahari, or the Nile swamps, the geographical features of Africa have facilitated the fusion of different racial stocks rather than their segregation.

Of the three principal stocks, the Bushmen are unique in possessing a distinct physical type, language, and culture.² They are short, though not pygmies. The skin is yellowish brown, and the hair appears to grow in patches and is rolled into small tangles giving the so-called 'peppercorn' appearance. The head is low in the crown, the face and nose flat, the cheek-bones prominent, the forehead bulging, the eyes narrow and slightly oblique. The Bushmen, who appear formerly to have occupied a great part of

¹ C. G. Seligman, *Races of Africa*, 1930, p. 19.

DENSITY OF POPULATION

Based on a map in Mr. Walter Fitzgerald's AFRICA by kind permission of Messrs. Methuen

Africa, now, however, number only about 7,500 and are confined to the Kalahari desert and parts of South-West Africa. Reckoned among the most primitive of African peoples, they are possibly allied to the pygmies of the Congo, French Equatorial Africa, and Kenya.¹ They live in small bands by hunting and gathering roots, but have no clan organization. They are famous for their wall-paintings, which were executed on rocks at a time when the race was more widely distributed than at present, and are in many cases of high artistic merit. Their language is characterized by the well-known Bushman 'clicks', adopted by a number of other South African peoples.

The Hottentots² are generally supposed to represent a mixture of stocks in which the Bushman and Hamite elements predominate. They also are now numerically unimportant and are confined for the most part to South-West Africa north of the Orange river. They are pastoralists owning long-horned cattle and fat-tailed sheep; they have a particular form of clan organization and follow a cult of sacred fire, which is believed to be a Hamitic trait.

The Negro type³ is characterized by the dark brown skin popularly called black, woolly hair, a taller stature than the Bushmen, a fairly long head, a flat broad nose, thick lips, often everted, and prognathous jaws. The Bantu and Nilotic tribes owe many of their physical characteristics to Negro ancestors, and have, indeed, been described as 'Bantu Negroes' and 'Nilotic Negroes'; but the peoples with which this type is associated in its purer form inhabit West Africa roughly from the mouth of the Senegal river to the eastern frontier of Nigeria. Their languages constitute a distinct group. They are mainly agriculturalists and among African peoples they have achieved the highest development of arts and crafts.

The Hamitic stock has three main branches—the Western, which includes the Berbers and the Tuaregs; the Northern, which is represented by the Copts; and the Eastern branch, which includes the Hamitic peoples in the area with which we are concerned.

¹ P. Schebesta, *Bambuti*, 1932; *Der Urwald ruft wieder*, 1935; R. P. Trilles, *Pygmées de la forêt équatoriale*, 1932.

² C. G. Seligman, op. cit., p. 33.

³ A. C. Haddon, *The Races of Man and Their Distribution*, 1924.

The typical Eastern Hamite¹ has thick but not everted lips; he may have fuzzy, wavy, or almost straight hair; his fine nose, often of European shape, differentiates him from the Negro. Among the peoples classed as Eastern Hamites the skin colour varies widely, but is generally brown. The Eastern Hamites are typical pastoral people, with the long-horned cattle depicted in ancient Egyptian paintings; the sacred fire cult is general among them, and they frequently have a religious attitude to cattle and the handling of milk. Their political organization centres around the patrilineal clan, and is associated with boys' initiation ceremonies and circumcision. Most of the available evidence, archaeological and anthropological, indicates that successive waves of Hamites have invaded Africa from a cradle-land² in the vicinity of southern Arabia or the Horn of Africa; and the present distribution of Bushman, Negro, and Hamite characteristics, whether separately or in combination, has been attributed to the effect of these invasions. Hamitic features are strongly represented in Somaliland and Abyssinia. West and south of this region, in conformity with the theory that the migration spread fan-wise from this centre, Hamitic characteristics partially modified by Negro features are found. These tribes have been classified as 'Half-Hamites'³ and 'Nilotes',⁴ though the terms have not gained general acceptance. Spreading fan-wise still farther south and west are the Bantu, a group of tribes of predominantly Negro race believed to have been modified in some regions by a greater or less admixture of Eastern Hamitic or Bushman-Hottentot blood. At the extremes of the fan, among the Negroes of West Africa and the Bushmen of the south, Hamitic traits are not present.

The Bantu, of whom there are some 40,000,000, inhabit Africa from coast to coast south of the so-called 'Bantu-line'.⁵ This boundary runs from the mouth of the Rio del Rey along the frontier of Nigeria and the Cameroons, thence eastwards across French Equatorial Africa and the Belgian Congo, south of the Uele river to the head of Lake Kiogo, south of Mount Elgon along the eastern shore of Lake Victoria, thence across Tanganyika and

³ *Ibid.*, p. 157.

⁴ *Ibid.*, p. 161.

⁵ *Ibid.*, pp. 20-1.

northwards to the hinterland of Mombasa, whence a narrow enclave runs north-west to Mount Kenya. The Bantu speak languages which have common features. The nouns are divided into classes, and each class has its own grammatical agreements; grammatical changes are commonly made by adding prefixes to the root. Some form of the word *ntu* denotes 'human being': hence the name Bantu, meaning 'people'.¹ But their cultural traits are not easy to define, since they tend to combine supposedly Hamitic elements, such as a sacred attitude to cattle, a sacred fire cult, puberty ceremonies with circumcision, and iron-work, with traits found more commonly in Negro Africa, such as their political and clan organization.

Among each of the large groups—Eastern Hamites, Bantu, and West African Negroes—variety of physical type, political organization, and economic life is more striking than similarity. Thus, among the Eastern Hamites there are Masai, who have many cattle and despise vegetable foods, and Arusha, who live by hoeing and own few beasts. Among the Bantu, the Swazi are black and the Bechwana are yellowish-brown, the Waha are meagre and slight, and the Ganda are upstanding and muscular. The Negroes include the centralized monarchies of Ashanti and Dahomey, together with the Ibo, a tribe of 4,000,000 persons, who are divided between 2,000 political units owing no external allegiance.² It is, moreover, important to note that the main groups occupy areas marked by a considerable variety of climate and cultural conditions with a corresponding diversity of the habits and customs associated with such conditions. In attempting therefore in the following pages to characterize the main types of native society, it will be necessary to proceed rather by way of illustration than by detailed description.

¹ Consistency in the spelling of African names presents many practical difficulties. *Ba, Wa, &c.*, are plural prefixes denoting the people, e.g. Baganda; *Mu* or *M* are singular prefixes, e.g. Muganda. The prefix used to show language is *Lu, Si, Se, Chi, Ki, &c.*, e.g. Luganda. Expert opinion tends to omit the prefix and to aim at a more exact form of the root, e.g. Sotho rather than Suto, or than Ba-suto or Se-suto. In this Survey the policy followed is that recommended in June 1933 by the Council of the International Institute of African Languages and Cultures, which is frankly a compromise. In the chapters dealing with the African peoples and languages in their more technical aspects the latest spelling is generally used, but elsewhere forms familiar through long usage have been retained.

² M. Perham, *Native Administration in Nigeria*, 1937, pp. 222 ff.

(a) The Bantu People

The Bantu-speaking peoples represent the great majority of the native inhabitants of the Union of South Africa, the Rhodesias, Kenya, Tanganyika, and Uganda, the Belgian and the Portuguese colonies, and a part of the population of the French Congo. The various tribes appear to have reached their present homes in a series of migrations westwards and southwards which are believed to have been set in motion by the pressure of Hamite invasions. These movements were still in progress when the early settlers pushed inland from the Cape, and some tribal migrations have occurred since that date. One might instance the movement of the Ndebele and Ngoni, groups of Zulu who revolted against Chaka's leadership, from South Africa to Southern Rhodesia and Nyasaland respectively. The majority of the Bantu tribes combine agriculture with cattle-keeping; it is only those who inhabit forest or tsetse areas that have no cattle, and among the rest, attachment to their cattle is so pronounced that it is often regarded as the most characteristic element in their culture. Cattle are not only the most prized form of wealth, but are often surrounded by religious and magical beliefs and practice. In many areas it is regarded as wrong to slaughter them except on ceremonial occasions, and the value attached to cattle over all other forms of wealth presents serious problems to administrations anxious to combat the consequences of over-stocking.¹ It is of particular importance that cattle are used for the payment of the bride-price by the family of the bridegroom to that of the bride, which is necessary in most of the tribes to legalize marriage.

In agriculture the Bantu, in common with most other African peoples, practise some form of shifting cultivation.² In the majority of cases this consists simply in alternate cultivation and abandonment of the land in the neighbourhood of each village. In Nyasaland, Northern Rhodesia, and the adjoining parts of the Belgian Congo, the ground is fertilized by cutting down and burning the bush, and then remains productive for three or four years, after which the village is moved and a new area cleared. This method involves moving through a wide radius in order to give time for

¹ See Chap. XIII, p. 882, and Chap. XVI, p. 1111. ² See Chap. XIII, p. 879.

the bush to recuperate, and gives to the cultivating group itself something of a migratory character.

The type of the Bantu village varies with climatic and other conditions. The typical South African kraal is a small group of houses close together, fenced for protection against wild animals. Farther north a larger number of huts are grouped around a central open space with small cultivated plots near at hand, but the principal fields are some distance away, so that at the busy season it is necessary for families to move to temporary shelters among them. In Bechuanaland these groups are large enough to constitute considerable towns; Serowe, the capital of the Mangwate, has a population of some 25,000, some of whom have to go ten or fifteen miles to their fields. In the rich banana country near the equator the compact village gives place to a series of homesteads, each surrounded by its own banana grove. With the security brought by European rule there has been a tendency for the dispersal of compact villages.

Among some Bantu peoples, for instance the Kikuyu of Kenya and the Zaramu of Tanganyika Territory, there is no centralized political organization. The elders of the various clans exercise some authority over the members of their own group, but recognize no common allegiance to a single head. Other Bantu tribes have, however, been welded together into a close-knit unity, and in that form have exacted tribute from neighbouring peoples. This process of consolidation was still going on among many of the tribes when European administration came into contact with them. Faced with the efficient military organization of the Zulu under Chaka, the Basuto became unified under Moshesh, and to this day they take pride in their description as the Basuto nation. In Tanganyika the German administration found the Bena and Hehe organized as unified tribes; struggles for leadership were in progress among the Chaga and Nyamwezi, and were checked by the suppression of fighting between natives. In the Belgian Congo the Bushongo and Lunda formerly ruled over many other tribes, and still have highly organized systems of government.

On the north and west of Lake Victoria a series of people—the Ganda, Nkole, Toro, and Nyoro of Uganda, the eight Haya tribes of Bukoba district in Tanganyika, and the Ruanda of the

Belgian mandated area—have arisen from the conquest of Bantu agricultural people by Hamitic pastoral invaders from the north, which is believed to have occurred not more than 300 years ago. In most of these Lacustrine kingdoms, as they are called, the pastoral people—known as the Hima—still form a ruling class who do not intermarry with the agricultural serfs; in Bunyoro, however, there has been a certain amount of fusion, and in Buganda the fusion is complete.

Among the politically centralized tribes authority is sometimes in the hands of a ruling clan, the lesser chiefs being relatives or nominees of the paramount chief, as is the case in Barotseland; sometimes, as with the Chaga, the subordinate authorities are nominees of the chief selected for their loyalty. The extreme case of the latter type is probably the Buganda kingdom, where all the lesser chiefs were appointed by the Kabaka, who transferred them freely from one district to another. These peoples were not organized into fixed territorial divisions as are European or even some West African states. Population was sparse, houses easily built and destroyed, and residence in one place seldom permanent, even in the regions which do not practise the type of cultivation that involves the removal of a whole village every three or four years. In South Africa a chief or headman, when appointed, founded a kraal at the spot which he chose, and his followers attached themselves to him there. In Buganda a chief was appointed over a village in the sense of a group of persons, not of an area of territory; when he was moved elsewhere his followers, if he was popular, would go with him, so that the size of a given village, and consequently the value of the position of its chief, was subject to change.

In many Bantu tribes initiation ceremonies take place for admission to adult membership of the tribe. Sometimes, as among the Kikuyu and Kamba, a whole age-grade of boys is initiated at one time, usually with a corresponding ceremony for girls. The men's age-grade was used as the basis of military organization or of political authority, and may still be important for the latter purpose. Other tribes, such as the Tonga and the peoples of Southern Rhodesia, have initiation ceremonies without fixed age-grades. The matrilineal tribes of Northern Rhodesia and the Congo initiate

only the girls. In the case of boys, the initiation rites are often preceded by instruction in tribal duties, by tests of courage and even the teaching of poetic forms.¹ The rite itself often includes circumcision. With girls, instruction is given in household duties and sometimes a period of seclusion in a hut is imposed when they reach puberty; in some cases the ceremony also involves an operation. The military power of the Zulu was based on the training given to each age-grade at the chief's head-quarters after initiation. In Bechuanaland, where the age-grade system still flourishes, the regiments are held liable to work at the chief's orders, and may even be ordered to go to the Rand mines and earn a stipulated sum of money.

The Ganda, who were formerly the most powerful tribe of the regions round Lake Victoria, had no initiation and no organization into age-grades. Among them the whole nation was raised in arms, each chief leading his own subjects when one of the periodical raids upon neighbouring peoples was decided upon; it is said that in five days from the first summons the whole man-power could be concentrated at the capital.

In Bantu Africa, and similarly among the West African Negroes, tribes which have important chiefs usually attach ritual and magical functions to the duties of chieftainship. Among most of them the chief is responsible for carrying out ceremonies on which the prosperity of the country and the fertility of land, herds, and people are supposed to depend. If his ministrations were unsuccessful, he would in some tribes be deposed or even killed. Among the Lacustrine peoples a special priesthood was responsible for the performance of religious ritual, and there existed a cult of the spirits of dead kings, who were believed to prophesy through the mouths of the attendants at their burial-places.

With the majority of the Bantu, as with most other African tribes, religion was based on sacrifices to their ancestors made by the senior member of each family, extended family, or clan. In some cases these were made regularly, in others only when some illness or misfortune was believed to indicate the ancestors' displeasure. Here the Lacustrine Bantu are peculiar² in that with

¹ F. Laydevant, 'La poésie chez les Basutos', *Africa*, vol. iii, no. 4, 1930.

² L. P. Mair, *An African People in the Twentieth Century*, 1933, pp. 224, 229.

them ancestor-worship seems to have been of little importance in comparison with the cult of the various tribal deities or *lubale*, whose shrines were established all over the country, and who dispensed, through their prophets, the various benefits which were believed to be in their gift.

(b) *The Negro tribes*

Numerically the Negro tribes of West Africa are roughly equal to the Bantu, though the area which they occupy is smaller. The coastal regions of West Africa, with their rich soil and heavy rainfall, support a denser population than the relatively arid east and south, and it is only round the shores of Lake Victoria that the population density of the Bantu tribes approaches that of the regions occupied by the Negroes. The long-horned cattle of the Bantu are not found among any West African tribes, a fact which is taken as showing that the Negroes are untouched by Hamitic influences. In the coastal regions, which are free from tsetse, a local variety of dwarf cattle is found, but the majority of the Negro tribes are purely agricultural. A considerable amount of economic specialization exists among them; whole villages will be formed of potters, dyers, weavers, or other craftsmen. As a result, frequent markets are held, and a striking feature of the Negro peoples is the active part which women take in trade;¹ an interesting example in modern conditions is the woman contractor for food to the Native Administration prison at Ibadan.² Most of the West African Negroes live in walled compounds in which a number of related families, under the authority of the senior member of the group, inhabit adjoining houses. Density of population and economic specialization together have led to the growth of large cities; in Southern Nigeria eleven towns have a population of over 50,000.

Every degree of political centralization and its absence is to be found among the Negro tribes. As an extreme case of dispersion of authority the Ibo-speaking peoples have already been quoted. Even within their 2,000 units there is no single ruler; the village elders, the priests, the individuals who have attained influence

¹ S. Leith Ross, *African Women: A Study of the Ibo of Nigeria* (to be published, early 1939).

² M. Perham, *op. cit.*, p. 182.

through wealth and personality, share in the exercise of authority. Some of the tribes of the Gold Coast northern territories are comparable in their absence of centralization. In contrast the Akan peoples of the Gold Coast have chiefs ruling with their councils over large areas. In some cases a paramount receives allegiance from a number of chiefs; a notable example is the Ashanti confederacy, dissolved by the British Government after the Ashanti wars and re-established in 1935.¹ The Gold Coast tribes have a regular procedure for the deposition of a chief, recognized by native custom and all too frequently resorted to in modern times.²

In French territory the Tukolor formerly held sway over most of the country between the Senegal and the Gambia. Farther east the Songhai, a tribe numbering about 2,000,000, ruled over the country south of Timbuktu until the French took that city, while the Mossi, whose power once extended from the upper Volta to include the Dagomba and Mamprussi of the Gold Coast northern territories, still have a centralized government with its capital at Wagadugu.

Midway in size between the fragmented units of the Ibo and the large states of the Tukolor and Mossi are the countries of the Yoruba in Nigeria. Their neighbours, the small kingdoms of the Igala, Igbirra, and Jukun, have chiefs who are the object of peculiar magical beliefs obliging them to respect complicated taboos the breach of which in former times involved their death after a relatively short period of office.

Among most Negro peoples considerable influence is exerted by secret societies, membership of which is obtained by the payment of dues and carries with it certain immunities from the ordinary processes of law. Among the Ibo there are women's societies which are responsible for the maintenance of discipline and respect for custom among the women.³ These societies were at one time regarded as organizations which held the community to ransom for their private profit, but it has now been realized that they had valuable functions in preventing crime and securing respect for law. Cannibalism and human sacrifice enter into the ancient

¹ See Chap. IX, p. 473.

³ M. Perham, *op. cit.*, p. 226; S. Leith Ross, *op. cit.*

² *Ibid.*, p. 469.

customary rites of some Negro peoples, but these practices have received publicity in Europe out of all proportion to their importance in Africa. Far more widespread is the cult of earth-spirits, closely associated with the spirits of the ancestors, in whose hands the fertility of the soil is supposed to lie. In the Gold Coast northern territories, for example, the *tendana* or priest of the land exercises almost as much power as the political head of the community;¹ indeed, in some cases it was the holder of this office who was selected by the German administrations of Togoland for the position of chief. In some instances the *tendana* is a representative of a conquered tribe to whom the conquerors pay respect as the only means of securing the favour of the spirits. Among the Ibo-speaking tribes the earth-goddess Ala is described by Dr. Meek² as 'the unseen president of the community'. In every village she has a shrine, and her priests, as guardians of morality and of the public peace, frequently have political or judicial functions.

The Hamitic conquests which gave rise to the Lacustrine kingdoms of East Africa have their parallel in the penetration of West Africa by invaders from the north. Of these the earliest were the Hausa, who now constitute nearly one-third of the population of Northern Nigeria; they are found in all the towns, their chief centres being in the Emirates of Sokoto, Katsina, Kano, and Zaria. Akin to them are the Kanem, Kanuri, and Baghirmi, who have built up kingdoms around Lake Chad. The Hausa are predominantly Moslem; they are traders and their language has become a lingua franca over a wide area. Since the early part of the nineteenth century their political predominance in Nigeria has given way to that of the Fulani, Moslem invaders who are Sudanese by language, but seem to be related to the peoples of Algeria and Morocco. To-day only some 300,000, the so-called 'cow Fulani', out of a total of about 2,000,000, cling to their nomad pastoral life. The highly developed political organization of the Fulani emirates was the first to be utilized in the policy of administration through existing native authorities which has now been widely extended through British territories.³

¹ R. S. Rattray, *Tribes of the Ashanti Hinterland*, 1932.

² C. K. Meek, *Law and Authority in a Nigerian Tribe*, 1937, p. 25.

³ See Chap. IX, pp. 416 ff.

(c) Hamitic Tribes

There remain to be described those tribes of eastern Africa which are Hamitic or in which the influence of the Hamites is evident in their culture and in some instances in their languages. In this area only the Galla and Borana of Abyssinia and the Kenya Northern Frontier Province are regarded as purely Hamitic; but the so-called Nilotes and Nilo-Hamites closely resemble them in mode of life. All these are cattle-owning people. The Galla and Borana, the Masai and Turkana, are still nomadic. The Nandi and Suk of Kenya, with the Teso of northern Uganda, now live in settled villages and practise agriculture. Other tribes of this area may be described as semi-nomadic, since they practise agriculture but move with their flocks. Characteristic of these tribes is the organization of the men into age-grades. It is usual here for authority to be exercised jointly by the elders' grade, while the tribal head, though he may be a man of great personal influence, has only religious functions. The attachment of these people to their own institutions, and their indifference to European influences, has been marked; they prefer their cattle to traders' goods, and the stimulus of money has not induced the pastoralists either to take to agriculture or to send their young men to work in any numbers.

This necessarily incomplete summary shows the wide variety of native society to be found in Africa, and the danger of generalization regarding the nature of African life. There are, however, salient characteristics in which African institutions and values may be said to differ markedly from those which European administration has brought to the continent. Such characteristics are the predominance of a subsistence economy without great differences in individual wealth; the recognition of close bonds of kinship uniting in obligations of mutual aid a group larger than the individual family; the existence of close bonds between such groups and the land which they have acquired from their ancestors or by conquest.

(d) Religious Beliefs and Social Concepts

Certain religious beliefs are shared by Negroes, Bantu, and Hamites, except where Islam and Christianity have established themselves; amongst these is a common belief in the unity of the

dead and the living which has led a Belgian observer to describe the tribe as 'une communauté de vivants et de morts où ces derniers ne sont pas les moins puissants'.¹ The soul, conceived as the vitalizing force in man, is believed to emanate from an unseen world composed of the spirits of the dead and of other spirits. Thus it is commonly believed that a spirit is responsible for animating the body of the unborn child, and careful divination at birth is necessary to ascertain the identity of the vivifying force. Spirits are thought to be quick to avenge, by causing disease and calamities, ills suffered during life, or disrespect shown to their graves or to their memory. Such beliefs act as a powerful sanction for native custom and are embodied in a cult of ancestor-worship with regular observances. In times of distress and illness steps are taken to discover which spirit is responsible, and to propitiate it by a simple offering.

The practice of magic both for beneficial and harmful purposes is common to African tribes. It is generally believed that the ritual treatment of certain substances by persons possessed of special powers can affect human beings, animals, or crops in a manner which is recognized to be outside the ordinary course of nature. Very commonly the substances used have qualities associated with the effects which it is desired to produce: thus magic to produce courage in war may include portions of a lion among its ingredients, and in many tribes the fertility of the soil is held to be directly influenced by the sexual life of the chief. In some tribes magic is performed by the chief on behalf of the community; in others it is the work of specialists, such as the priests of the small-pox god in Buganda who used to purify the villages after an epidemic. The two types of magic are usually distinguished in native speech; only harmful magic can approximately be called sorcery, and this is universally regarded by Africans themselves as a heinous crime. The witch-doctors derive their power from the belief that by divination and other means they are able to indicate sorcerers and protect the tribe and individuals against the practice of harmful magic.

Belief in magic has a psychological value in that it provides an explanation of unexpected misfortune, and an appropriate course

¹ P. Salkin, *Études africaines*, 1920, p. 104.

of action: in practice retaliation by magic is more common than the execution of the supposed sorcerer. It has its importance as a social force, since recourse to sorcery as a means of redress for injuries is held to be justified: this is a powerful sanction for general conduct, and in particular cases the threat of sorcery can produce such results as the return of stolen goods. Belief in magic would seem to be strong to-day among Christian converts as well as among pagan communities.¹

Many tribes have a conception of a Supreme Being, but it is not, as a rule, an object of worship, since it is held to take little interest in the everyday life of mortals.² Indeed, speculations or beliefs as to the attributes of a Deity occupy a minor place in the spiritual life of Africa; the dynamic of religion lies rather in the influence of the spirit world on daily life and in the importance attached to the use of magic. Yet it would be an error to suppose that the African feels himself hopelessly dependent on supernatural powers or superstitious practices; he is far from being the gloomy slave of a world of tyrant spirits; cheerful and resilient, he clearly feels that much still depends on his own discretion and industry, and his religion may be said to have reinforced rather than weakened his self-reliance. There is a further point. Every contribution made to the study of African religion or of the practices of social life, tends to emphasize the danger of treating Africans as types rather than as individuals. Like other peoples, they may have common ideas about religion or custom, but individually show every variety of human feeling or ability.³ The study of African religion or social life may assist the administrator to avoid errors due to ignorance of the general characteristics of the people, but he will remain in the end faced by a collection of individuals who, if powerfully affected by their own tradition, nevertheless show the widest differences of personal temperament and character. It is opportune to add here another consideration. In subsequent chapters reference will be made to the extent of our knowledge of African concepts on certain important aspects of social life, such as law and justice, the holding of property, and political organization. The sum of these studies

¹ See *Africa*, vol. viii, no. 4, 1935.

² D. Westermann, *Africa and Christianity*, 1938, p. 65.

³ M. Perham (ed.), *Ten Africans*, 1936.

undoubtedly presents a striking contrast to the European type of civilization now being introduced to the African; but a difference of religious concepts or of social observances, however marked, does not in itself convey any indication of an intrinsic divergence of character or capacity. There are indeed few of the observances of Africa to which a close parallel cannot be found at some period or another in the history of peoples now within the orbit of modern civilization. Social concepts and practices are largely an accommodation to physical or economic conditions; and it is more important to study the reactions of the African to the rapid changes in cultural and material environment to which he is being subjected, than to attempt any analysis of his character based on his traditional customs or beliefs.

II. PROBLEMS OF ETHNIC CLASSIFICATION

It is now generally recognized that the population of the modern world cannot be effectively classified into races by applying the methods employed in dealing with distinct zoological or botanical groups. On the usual zoological system¹ animals are grouped according to estimates of the degree of their evolutionary relationship; and there is throughout an underlying idea of common ancestry. It was inevitable that a similar method, based on like assumptions, should have been attempted in regard to human beings, but anthropologists have recognized that other methods are required in seeking to trace the relationships of the groups into which the species *Homo sapiens* became divided. Man has migratory propensities. Thus, while in most animals localization leads to the formation of distinct geographical races, and may result in the differentiation of these as mutually infertile species, in man local differentiation has been followed by migration and crossing between the differentiated groups, so that mutual infertility has not been produced. Therefore, while in general in the classification of zoological types degrees of resemblance can be taken to indicate degrees of relationship, caution is required when applying this conception to the sub-varieties of modern man. In the case of man we can do no more than attempt to distinguish geographical

¹ J. S. Huxley and A. C. Haddon, *We Europeans*, 1935, chap. iv.

groups in terms of their measurable physical characteristics; and we must be content with group rather than individual characteristics, such as averages, or better, frequency distributions, of different characters. In the majority of groups, therefore, a number of physical types will be present which appear to be characteristic of the original components of the mixed group, but there will also be found numerous intermediate types and usually a certain number of individuals who appear to be new aberrant types, due to recombination.

Certain characteristics are currently used as a basis of racial classification. The most important are hair form and colour, skin colour, eye colour and form (including the orifice of the eye), stature (though this may be affected by nutrition), head form, which is believed to be relatively unchanged by environment and which lends itself to the convenient measurement of cranial index,¹ and nasal form (including bony structure and spread of nostril). In addition there are physiological and psychological factors, such as pulse-rate, incidence of disease, colour-vision or sense-perception, the ethnic significance of which are not yet precisely defined, and the new and promising approach through blood-groups. This last method is based on the discovery by L. and H. Hirsfeld that, in point of agglutination of blood, all human beings fall into four main groups. These differences depend on three allelomorphic genes, so that blood-grouping is inherited in a simple way, which is not the case with the usual physical criteria by which human groups are defined; it is accordingly possible that a complete study of the blood-group genes might throw light on the origin of various human populations. So far, however, many of the results obtained reveal a complex situation which still requires explanation. Finally comes a group of special physical peculiarities confined to a single group—such as the ‘Mongolian eye’—which are useful to the anthropologist. The most striking of these is *steatopygia* (i.e. an excessive accumulation of fat on the buttocks), found among Bushmen and Hottentot women.

It appears clear that the use of physical characters, however carefully elaborated, will not in itself afford a basis of classification, in the sense of making it possible to delimit groups all

¹ Maximum breadth of the head expressed as a percentage of the maximum length.

members of which are marked by common and clearly defined characteristics. If any single criterion of difference is taken, such as skin colour or cephalic (cranial) index, it is possible to show that it has a fairly definite geographical distribution; but the classifications based on different criteria do not coincide closely.¹ One can speak of a characteristic physical type which occurs predominantly in a given geographical area; but it would be inaccurate to suppose that a person's ancestry could be deduced from the degree of his conformity with that type; in any area which may be studied, whether it be the territory of a European nation or an African tribe, the population shows a wide range of deviation from the average in every measurable characteristic. Moreover, while in terms of averages it may be possible to say, for example, that Ganda are taller than Kikuyu, there will always be a considerable measure of overlapping, so that the tallest of the second group is a good deal taller than the shortest of the first. This is the case with most measurable features.

The present state of our knowledge with regard to the physical characteristics of the African peoples has been summarized by Dr. G. M. Morant.² Anthropometric records have been collected since about 1860; but many of the measurements made have been the work of observers who have had no technical training. The most adequate surveys so far made relate to parts of North Africa. The value of the work done up till now has been in indicating the nature of the problem rather than in providing solutions. It has been found, for example, that in Central Africa the ranges of cephalic indices and of statures reach extremes almost as far apart as those shown by all races in the world, and that there appears to be little correlation between the averages of these two characters for different groups. A grouping based on nasal measurements would be quite different from that given by either cephalic index or stature. A satisfactory classification can thus only be based on the comparison of a number of physical characters.

The study of blood-grouping has not been carried as far in

¹ L. Hogben, *Genetic Principles*, 1931.

² Quoted by E. W. Smith, 'Africa: What do we know of it?', *Journal of the Royal Anthropological Institute*, vol. lxx, 1935, pp. 35-7.

Africa as in some other parts of the world; a comparatively small number of persons have been examined and the majority are natives of the Union and South-West Africa, though a considerable study has also been made of blood-grouping in the Pygmies. Dr. A. Pijper¹ suggests that the high incidence among Bushmen of the O blood-group, which is regarded as the most primitive, shows that they were the first inhabitants of Africa. Mr. Elsdon Dew² concludes that the Bantu are the most primitive black race now known, and that the Negroes are the result of a mixture of Bantu with other stock, such as the Egyptian. It is clear, however, that this new criterion, important as it is, cannot be taken, any more than any single character, as sufficient in itself to establish a classification of races. It has been found elsewhere that clear differences in the percentages of the blood-groups can be found among groups of persons differing only slightly in other anthropological features, while some populations differing clearly in other respects showed similar blood-group distributions.

A comparison of the measurements of some 600 skulls from different parts of Africa, published by other anthropometricians, with those of 120 skulls from the Teita region of Kenya, was made in 1931 by Miss Elizabeth Kitson.³ This leads to the conclusion that no sharp distinction can be drawn between the races of western, eastern, and southern Africa; skulls found in the Gabon resemble those of East and South Africa more closely than those of the Congo. The Teita skulls are more nearly related to those of the Ngoni and Hottentots than to those of their neighbours in Tanganyika, while the latter, in certain features, resemble the Galla and Somali and the predynastic skulls from Egypt. All the material dealt with by Miss Kitson is modern in date; skeletal material furnishes the only evidence of the physical characters of past populations which the anthropologist is likely to obtain, but, except in Egypt, there is an almost complete lack of such evidence bearing on the origins and early movements of the populations which now inhabit Africa. A few prehistoric skeletons have been

¹ 'Blood-Groups of Bushmen', *South African Medical Journal*, vol. vi, 1932.

discovered, but the evidence which they provide is insufficient to form the basis of a conclusive theory.¹

The study of human genetics is of social importance because of its possible bearings upon differences in the mental capacity of various human groups. Two opposing theses have been equally freely assumed: that the brotherhood of man implies universal equality of innate capacity, and that those nations which are in a position of domination over others have superior inherited qualities. Neither school of thought can turn, in support of its view, to any data experimentally obtained.

Anthropologists and others have suggested various ways in which conclusions as to the mental qualities of different races might be drawn from their physical characteristics. The American anthropologist, Professor Kroeber, suggested that 'if one human race shall prove definitely nearer to the apes in its anatomy than the other races, there would be reason to believe that it had lagged in evolution'. Also there would be some presumption that its arrears were mental as well as physical. The question could be approached by counting all features of all races in order to see which was the most un-ape-like. But the result, as he pointed out, would be 'an evenly divided count, whichever way the majority fell'.² It will now be generally agreed that the process of evolution within a species, especially one with such a degree of intercrossing as is found in man, cannot be reconstructed in the form of a simple pedigree, since similar types can be produced not only by inheritance from a common ancestor but by the Mendelian recombination of characteristics which may have been quite differently distributed in the ancestry of two individuals.

The possibility of finding a means of measuring the comparative mental capacity of Africans has lately formed the subject of some public discussion as the result of certain proposals for inquiry put forward by Dr. H. L. Gordon of Nairobi.³ In an examination of 3,444 Kenya natives Dr. Gordon found 'consistent inferiority

¹ L. S. B. Leakey, *The Stone Age Races of Kenya*, 1935, *Stone Age Cultures of Kenya*, 1931; see also correspondence in *Nature*, 1931-7.

² Quoted L. Hogben, *op. cit.*, p. 162.

in brain capacity as estimated by head measurements and in certain physical and psychophysical attributes' as well as in performance in intelligence tests.¹ He found that the average increase in volume of the African brain between the ages of 10 and 20 is 8.5 c.c. as against 17.7 c.c. for the European, while the average adult capacity of African and European brains is 1,316 c.c. and 1,481 c.c. respectively. Complementary research by Dr. F. W. Vint,² of the Government Medical Research Laboratory, Kenya, showed further similar contrasts. While not claiming that his observations have been sufficient to form the basis of any far-reaching conclusions, Dr. Gordon considers that they establish the existence of a state of 'backwardness' in the tribes with which he has dealt. He has devised a term—*bradyphysis*—to denote the condition of the Kenya tribes which he describes as 'a non-progressive state showing deficiencies of social, moral, intellectual, and material self-development'. He assumes that *bradyphysis* is an abnormal state, and has proposed that systematic inquiry into its causes should be undertaken as a basis for future plans of development.

Scientifically, two criticisms may be levelled against the views put forward. So far as concerns conclusions drawn from brain measurements, it must be realized that nothing is definitely known regarding any correlation between the physical characteristics of the brain and intellectual or moral qualities. So far as concerns the assumptions regarding inherent characteristics which have been based on more general arguments, we are faced with a fundamental difficulty. The abnormal condition of the Kenya native is taken for granted; yet it is difficult to see what is to be the criterion of normal 'self-development', or exactly how *bradyphysis* is to be diagnosed. Is it recognizable by the failure of the people affected to have attained a certain cultural level before they were subjected to European influence and, if so, what is the level which normal development would have attained? Or does it appear in the reaction to European influences? In the latter case the methods by which those influences have been exerted, and the degree to which they permitted of the developments

which have taken place in neighbouring territories, would be as relevant to the investigation as an assumed inherent incapacity for adjustment in the peoples of Kenya.

There would seem, in consequence, little advantage to be derived from the suggested inquiry into the physical characteristics of the African's brain as a basis of conclusions regarding his mental capacity. Certainly research of this type could not produce results of the social and political importance which some have expected from it. As regards the proposed inquiry of a more general nature into the causes and the assumed 'backwardness' of the Kenya tribes, while research into the physical characteristics or the psychology of the African is to be welcomed, such inquiry tends to lose its value as soon as it ceases to be objective, and it would not be reasonable to suggest support for an investigation based on assumptions such as those which characterize the theory of Kenya *bradyphysis*.

Comparisons between groups of persons of different descent have at times been based upon their performances in intelligence tests. In the United States such a test was given to all army recruits during the War, and resulted in every State in higher scores for whites than for negroes; though the fact that the negroes of the Northern States did better than those of the South is an indication of the importance of environmental conditions in producing the type of intelligence that was being tested. At one time hopes were entertained that important conclusions regarding racial abilities could be drawn from tests of this kind, but as the methods used came to be examined more critically it was realized that they were not so devised as to eliminate the effects of differences in environment and upbringing. An investigation made in Jamaica of samples of the white, negro, and mixed population had the advantage that there the differences in social environment between the different groups are not great. In this case very little difference could be found between the aggregate performances of the different groups; some excelled in one type of test, some in another.

If we adopt the definition of intelligence given by C. Spearman,¹ its most important element is the ability to educe relationships. In seeking to determine the potentialities of the African

¹ *The Abilities of Man*, 1927.

intelligence in the sense of its power to learn, whether from a teacher or from experience, this is the quality which must be measured. The possible methods of measurement would be by the posing of problems which normally arise in the environment of the person tested or by the construction of non-verbal tests involving the recognition of relationships. The first method is of course open to the criticism that the results achieved would not be comparable with those attained in other tests. The second obviates this difficulty, but up till now very few such tests have been devised.¹ A general intelligence test for Africans, representing an adaptation to local conditions of the technique most widely used in Europe, was published in 1932 by Mr. R. A. C. Oliver,² who investigated this question on behalf of the Carnegie Corporation. The test requires an elementary degree of education. It is advocated for the limited object, which is all that psychologists now expect of most such tests in Europe, of determining how far school-children at a given stage can profitably proceed to further education. This test was not devised with a view to drawing comparisons between African and European intelligence. The author himself expresses the view that none of the grounds of comparison so far used yields valid or decisive data, and that no existing mental test can be used as a standard of comparison between populations which differ widely in culture. Nevertheless, the results of its application to 93 African and 124 European secondary schoolboys in Kenya have a certain interest. The average mark of the Africans was approximately 85 per cent. of that of the Europeans, but some 14 per cent. of the Africans, in spite of the group's undoubtedly lower level of environment and education, gained marks as high as, or higher than, the European average. Standardized tests were used on a large scale by the Interdepartmental Committee on Native Education of the Union of South Africa during 1935-6.³ They were applied to some 12,000 African pupils comprising practically all those in Standard VI and above in all four Provinces. The tests used were those which had previously been standardized in

¹ See L. S. Penrose, *Mental Defect*, 1933.

² 'Mental Tests in the Study of the African', *Africa*, vol. vii, no. 1, 1934, pp. 40-6.

³ *Report*, U.G. 29, 1936, paras. 502-12.

connexion with nearly 30,000 pupils in European schools, and were tests of knowledge gained in school rather than intelligence tests as that term is usually understood. They consisted of arithmetical questions and problems, and of tests of familiarity with English words, both simple and difficult. The comparisons between European and African children which were based upon them refer to the quality of the instruction received rather than to natural intelligence.

It should be noted, moreover, that even in the Kenya experiment these conclusions relate to a single characteristic—a proficiency in those mental processes which the European system of education seeks to develop. They do not in themselves afford evidence in support of the assumption that the mental capacity of Africans is inferior to that of Europeans, even judged by standards primarily devised with reference to European conditions. They tell nothing of the probable success of the average African in agriculture or in business: practical thinkers may indeed be permitted to doubt whether it is in fact possible to devise tests which would enable such characteristics to be ascertained.

While further investigations are essential to the development of the process of ethnic classification, the results are likely to be of scientific interest rather than of direct concern to administrators. A more extended use of intelligence tests, on a basis suited to African environment, is likely to yield results which may be of value to the educationalist; but it is doubtful if any general investigation into the comparative mental capacity of the African can yield conclusions which will form a safe basis for the determination of general administrative policy.

III. STUDIES IN AFRICAN SOCIAL LIFE

(a) *The Knowledge of African Life and Custom*

In Africa there has developed a general recognition that policies which do not take into account the nature of the native societies to which they are applied are apt to provoke unforeseen and unwelcome reactions. Towards the end of the nineteenth century Mary Kingsley emphasized to the English public the need for a wider knowledge of the facts of African life; she justly remarked

that in colonial rule goodwill is no substitute for knowledge which 'will act in the direction of preventing us from engineering our good intentions in such a manner as to make them appear tyrannies and hateful to those whom we wish to benefit by them'.¹ It would be possible to point to many errors due to the misinterpretation of native customs.² Perhaps the most typical example is the disapproval shown by early missions of native marriage rites, the importance of which, in giving legal validity to marriage, they did not understand; the influence of this attitude was seen in official declarations of policy such as Sir Harry Smith's demand to the Kaffirs in 1848 that they should 'abolish the sin of buying wives', and in the judicial practice by which courts in some parts of South Africa refused to take cognizance of marriage contracts based on the payment of *lobolo*, the bride-price.³ It was not until 1927 that the Union Native Administration Act, in stipulating that the courts should not declare *lobolo* repugnant to natural justice, recognized the true character of this institution.⁴ Numerous difficulties have been caused by the official recognition as chiefs of persons holding no traditional authority, or by a misunderstanding of the true functions of chieftainship. Governments have been constrained to admit mistakes due to their failure to appreciate the nature of African land-tenures.⁵ The conclusion of the inquiry into the disturbances of 1929 in south-eastern Nigeria, that taxation should not have been introduced until further knowledge had been gained of the social institutions of the people,⁶ is one of the many instances in which the need for full information as a basis for administrative action has been recognized; and in the same region the success achieved in the reorganization which was later carried out to meet the special needs of the social organization found to exist affords a striking example of the value of a close study of native institutions.

¹ S. Gwynn, *Life of Mary Kingsley*, 1933, p. 238.

² See, e.g., Chap. IX, p. 424, Chap. XII, p. 837.

³ See Chap. IX, p. 362; I. Schapera in *The Bantu-speaking Tribes of South Africa*, 1937, p. 381. Although *lobola* is the more common usage, *lobolo* appears to be the correct form of the Zulu-Xhosa noun.

⁴ *Report of the Native Economic Commission*, U.G. 22, 1932, pp. 102-4; E. H. Brookes, *The Colour Problems of South Africa*, 1934, p. 145.

⁵ See Chap. XII, pp. 836 ff.

⁶ *Sessional Papers of the Nigerian Legislative Council*, Nos. 12 and 28, 1930.

The acquisition of a more complete knowledge of African social conditions is a composite process, in which a great variety of agencies have taken part. It is not the result only of inquiry directed to this specific purpose. The change in general policy, which recognizes the value of African institutions as part of the new structure now being created, is in itself important alike as an incentive to the study of custom and to its more competent interpretation. The experience of administrators and missionaries, of educationalists and the growing body of technical officers, has made contributions which, if often unrecorded, have nevertheless had their own significance in building up the body of knowledge of native life and custom. One of the present problems of the administrations, however, is to determine how far the knowledge thus acquired needs definite correlation, or should be supplemented by special investigation of the type associated with the methods of the anthropologist. It is to this latter point, therefore, that we shall first direct attention.

(b) *Aims and Methods of Social Anthropology*

The presidential address delivered to the Royal Anthropological Institute in 1935¹ examined the field covered by anthropological studies in Africa, including its archaeology and palaeontology. In the Survey on which we are now engaged it is natural that attention should centre mainly on those aspects of anthropology which bear most closely on the problems presented by the changes now taking place in Africa. The development of anthropological inquiry, as of all scientific studies, has been due to contributions from many sources, and from thinkers holding different aims. It is unnecessary here to attempt to assess the value of the additions made by different schools of thought to anthropological knowledge; it is sufficient to say that, for the present purpose, a study of cultural origins, by whatever method it may be pursued, is of less importance than that type of inquiry which concerns itself with existing peoples and their social institutions. This branch of anthropology is variously described as social, practical, and functional; its avowed object is to assist the government and development of the peoples studied, and attention is concentrated on

¹ E. W. Smith, *op. cit.*

the practical problems involved. Modern anthropological work of this type in Africa attempts to record the behaviour of the African in his reaction to indigenous and imported influences, and it is progressively devoting greater attention to the latter. It aims at exposing the influences which have results in behaviour; it views reforms, such as the preservation of soil fertility and the introduction of direct taxation, not only as problems of agricultural practice or administrative action, but as changes in human behaviour. At its best, it indicates how a desirable reform may be brought about in such a way as to harmonize with the custom of the people whom it affects.¹

How far the knowledge of earlier custom is necessary for these purposes has been the subject of some debate. Since practically all African tribes have been undergoing organic changes for many centuries, both under external influences brought in by Hamitic invasions, Arabs, and Europeans,² and under internal influences due to natural disasters, the evolution of agriculture and the consolidation of chiefdoms, the complete reconstruction of a previous social structure at one point of time presents great difficulties and would be of little practical value. In order to interpret the reactions of Africans to European culture, however, it is necessary to be in a position to distinguish the elements borrowed from Europe from those indigenous to the native community. The study of African reactions to European culture, in such matters as marriage, inheritance, the private ownership of land,³ and the sanctions for law and order,⁴ is perhaps the most important aspect of anthropological work to-day.⁵

Anthropological inquiry was at one time largely concentrated on the Pacific Islands. The greater attention now being devoted to Africa is due primarily, no doubt, to the improved conditions which that continent has offered to research workers in recent years, and also to some extent to the practical problems created

³ See Chap. XII, pp. 836 ff.

⁴ See Chap. VII, pp. 264 ff.

⁵ For studies on culture contacts see A. I. Richards, L. P. Mair, M. Hunter, I. Schapera, A. T. and G. M. Culwick, M. Fortes, and G. Wagner, in *Africa*, vol. v, no. 2, 1932; vol. vii, nos. 3 and 4, 1934; vol. viii, nos. 1-3, 1935; vol. ix, nos. 1 and 3, 1936.

by the attempts to use African institutions in the administrative organization of colonial territories.¹ This increased interest owes much to the establishment, by the University of Capetown in 1918, of a School of African Life and Languages, and it received a stimulus in 1926 from the publication of *The Golden Stool*,² which made a survey of the results of European contact on native societies, and appealed for understanding and respect for institutions in danger of destruction, which it would be difficult to replace in a changing social structure. In France similar arguments have been advanced,³ and a Belgian writer has pointed out various instances in which policy in the Congo has failed to make due allowance for native custom.⁴

In the early years of this century anthropologists usually followed the method of 'survey work' in which the inquirer travelled over a wide area recording for each tribe the broad characteristics of physical type, social organization, and material culture. In Rivers's survey work among the Todas in Melanesia (1901-2) he spent a short time in each island, and sometimes questioned not more than one informant. Dr. J. Roscoe, who spent twenty-five years among the Ganda,⁵ states that he obtained much of his information from natives who were brought to his home from various parts of the country. It is now realized that information obtained in this way needs to be supplemented by more detailed inquiries. In England the volumes published in 1922 by Malinowski⁶ and Radcliffe-Brown⁷ have had a marked influence in establishing the methods which are now followed by numerous field-workers. In present-day practice knowledge of the language of the people under investigation and an acquaintance with the philological principles by which behaviour is related to forms of expression are regarded as important if not indispensable.⁸ The worker is expected to keep daily diaries, to collect case-histories and statistics, and to make plans of villages and gardens. Inquiry proceeds by the method of taking samples which are typical of

larger units:¹ the inquirer must know, however, what sample is big enough to be reliable and yet not so big as to waste effort. In using the statements of informants he has to appreciate whether his source has experienced the typical influences to which the group has been subjected, or whether he has come under exceptional influences. Opinions rationalized with the intention of enlightening a European have to be discounted. A technical approach is considered necessary, not only in acquiring data, but in recording them. To take one example, it has been found necessary to list and analyse with special care the sequence of crops, for this has sometimes revealed a complicated long-period rotation which earlier investigations had failed to detect. Finally, the inquirer must be in sympathy, not only with the African, but also with the administrator whose work it is his object to assist.

(c) *Governments and Anthropological Inquiry*

There can be no question as to the value of the information which inquiries of this nature set out to provide. We may at the present day dismiss considerations based on the feeling that an 'anthropological interest' in native institutions may lead to an undue conservatism in maintaining custom which is either undesirable in itself or has outlived its use.² It is, however, true that governments have, as a rule, given little direct support to specific inquiry of the type above described, either by the creation of a post of government anthropologist or by subsidizing the work of research students. They have for the most part been content to rely on the information supplied by their administrative officers, based either on their general experience or on inquiries which they have been directed to make. The Indian Government also has made little use of the anthropologist; but there the circumstances were different from those of Africa. At the date of the British occupation ample material existed in the works of Indian writers

regarding the Hindu and Moslem custom which regulates the life of the great majority of the inhabitants, the linguistic difficulty was relatively small, and there were from the first included in the government services a number of Indian officers whose special knowledge was available on all questions in which Indian law or custom was involved. The official cadre was, again, of a strength which allowed for the provision of officers required for special inquiry on any point calling for detailed examination; and it was typical of the system that the officers who compiled the land revenue 'settlement reports', a valuable source of information on all local conditions, normally spent at least three years over the work of each district. It was in consequence only in certain of the areas separately administered as 'backward tracts' that anything of the nature of special study was felt to be required.

There is perhaps little to be gained by any detailed examination of the reasons why African administrations have not hitherto given more encouragement to workers using the method employed by social anthropologists. Possibly there is still in some quarters a belief that anthropology is a study mainly of antiquarian or academic interest; it may be felt by others that the modern anthropologist is so much absorbed in demonstrating the inter-action of all the social institutions in the wide field which he covers that he provides at no one point the type of information which can be readily used by the administration. It may be, again, that governments have been reluctant to admit that they are dependent on outside sources for information which should, in theory at least, be obtainable through their own officers; or that they are apprehensive of the influence which non-official inquirers may be tempted to exercise over the day-to-day decisions of the administration.

Government officers who have spent the greater part of their lives in Africa are apt to question the value of an anthropological inquiry lasting a comparatively short time; but while many officers have a profound and sympathetic understanding of the peoples among whom they have worked, and have made studies of considerable value to governments, experience has shown that the reliance by governments on reports furnished by their own officers engaged in ordinary duties for certain types of information regard-

ing African institutions may lead to serious misunderstanding.¹ The appointment of committees, to advise on matters involving a knowledge of native law and custom, of which the members are people who have not previously concerned themselves with such subjects, has more than once failed to yield satisfactory results.² Governments have recognized the need for inquiry on the lines of social anthropology in some cases to the extent of directing their own administrative officers to devote their whole time to this purpose. The Government of Nigeria seconded Dr. C. K. Meek and Mr. P. A. Talbot, while in the Gold Coast the late Capt. R. S. Rattray made extensive studies. Administrative officers have devoted their whole time to investigating the question of land-tenure in the Sukuma country of Tanganyika and in the Yoruba country of Nigeria, where Mr. H. L. Ward Price completed a notable study in 1933.³ Many of the works mentioned in the bibliography at the end of this chapter are the results of work by government servants and of the official encouragement which they have received. So far as their immediate usefulness to governments is concerned, the inquiries carried out in this way in the Ibo country of Southern Nigeria and the pagan areas of Northern Nigeria probably constitute the most valuable anthropological work which has been done.

The administrative officer as an anthropological inquirer works, however, under certain disadvantages. His relations with Africans are apt to be coloured by the fact that he represents the government. On the West Coast his tour of service is so short as to result in very frequent changes of station, and there are few officers who have long knowledge of any one locality; in some districts the multiplicity of dialects creates an exceptional difficulty; and almost everywhere in Africa the present conditions involve a pressure of work which leaves little leisure for detached study. Even when the administrative officer is not at a disadvantage owing to lack of experience in the technique of investigation, he is often compelled to confine himself to the more immediate and obvious aspects of the subject into which he is inquiring, and is

¹ See above, pp. 40-1.

² B. Malinowski, 'Practical Anthropology', *Africa*, vol. ii, no. 1, 1929, p. 30.

³ *Land Tenure in the Yoruba Provinces*, 1933.

unable to consider its wider relations in the social or economic life of the community. When, therefore, inquiries on specific subjects have to be undertaken, with a view to action, the government officer with a training in anthropological methods is likely to prove a successful investigator, only provided that he is allowed to devote sufficient time to the purpose. The professional anthropologist should, however, be able to provide a more complete picture of a native society, and, in areas where native institutions are least understood, he is likely to be of great assistance in providing the government with the knowledge which must form the basis of administrative policy. In general, it may be said that governments are likely to derive the greatest advantage from inquiries undertaken by anthropologists in association with their own technical or administrative officers.

While the tendency of governments has been to leave to the non-official agencies, of which some details will be found below, the employment of trained anthropological inquirers, there are some instances in which they have given direct evidence of the value they have attached to their services.

An experiment in co-operation between an anthropologist and an administrative officer, undertaken at the suggestion of the Tanganyika Government, resulted in the publication of *Anthropology in Action* (1935), by Gordon Brown and Bruce Hutt. This undertaking is of interest as showing the range of subjects in which the data collected by a trained investigator are relevant to questions of practical administration. The administration of the Northern Territories of the Gold Coast has lately circulated, for the guidance of officers in hearing appeals, the information regarding marriage customs collected by a field-worker among the Tallensi.¹ The data obtained by an anthropological inquirer regarding the nature and amount of native diet was found to have significant implications for agricultural policy in Northern Rhodesia.² In Uganda an anthropologist joined with an officer of the Veterinary Department in the study of the possibilities of the development of stock-raising in the Ankole district, a problem in

¹ M. Fortes, *Marriage Law among the Tallensi*, 1937.

² A. I. Richards and E. M. Widdowson, 'A Dietary Study in North-eastern Rhodesia', *Africa*, vol. ix, no. 2, 1936, pp. 166-96.

which the social factors, due to the traditional attachment of the Hima to their cattle, were of first importance. In Bechuanaland the Board of Advice on Native Education includes among its personnel the Professor of Social Anthropology in the University of Capetown; and the Swaziland Administration recently invited several anthropologists to make recommendations regarding the adaptation of the regimental (*ibutho*) system to modern educational needs.¹

(d) *Government Officers' Note-books*

In the British territories *District Note-books*, or, as they are termed in some areas, *Political Note-books*, are to be found at each district head-quarters; in Tanganyika these are supplemented by *Provincial Note-books*. Besides current information of a statistical nature, the note-books contain records of local tribal history and custom, the family history and connexions of native authorities, and observations on cases heard on appeal or revision from native courts. There are, however, wide differences both in the system observed in keeping these records and in the value of the material they contain. The primary object is not a systematic statement of custom, but the recording of information which may prove useful in the work of administration. There is a similar system of note-books in the Belgian Congo, there termed *Registres de renseignements politiques*. These follow a prescribed model, which lays stress on the importance of inquiry as the basis for the reorganization recently undertaken of native administration areas; the records are consequently more systematically maintained than many of the British district note-books. No systematic record of this nature appears to be maintained in the French territories.

The knowledge of government officials in Africa constitutes a vast reservoir of detailed information regarding African institutions and the changes which they are undergoing, and it would greatly serve the interests both of governments and of anthropological science if this information could be placed on record. It is strongly to be recommended that the district note-books should be developed with this end in view. The mere recording of

¹ See, e.g., H. Beemer, 'The Development of the Military Organization in Swaziland', *Africa*, vol. x, nos. 1 and 2, 1937.

interesting events will constitute a record of local history which cannot be preserved in any other way, but if the officers in charge of the books can be encouraged to work on the principle that all information relating to native social institutions is capable, in certain circumstances, of being useful to governments, the books might become of greatly enhanced value. Officers who have the advantage of training in the outlook and technique of anthropology will be able to make the best use of the books, but if an inexpensive manual on this subject were compiled it might prove of assistance to officers in general.

One of the functions of the books should be to record references to cases in the high court, magistrates' courts, and native courts, which are of importance in revealing native custom. It is of importance that before the records of court cases are destroyed the notes relating to such cases should be consulted, in order that any records which are of value may be preserved. It must frequently happen that the bare record of evidence in a court file represents but a fraction of the knowledge which the proceedings bring to light, and in such circumstances the district books afford an opportunity for the administrative officer or the magistrate to amplify the record on the court file. Attention might also be directed to the connexion between the legal aspects of institutions, with which the court files are concerned, and the social aspects of those institutions. M. Brévié, lately Governor-General of French West Africa, indicated the value of studies of this nature in a circular of 1931.¹

It should, again, be an important function of the note-book to record the state of social institutions at moments of change. For instance, in the event of large new areas of land being brought under cultivation for a new food crop, it may later be of value to know what was the position regarding the ownership and use of that land before the change, and what differences in native diet and other habits follow the introduction of the new food crop. Indications of a changing outlook in Africans are also of special interest; such, for instance, as a claim to personal ownership of cattle being contested on the ground that the cattle are the property of a family group. Not only administrative officers, but

¹ *Circulaires sur la politique et l'administration indigènes en A.O.F.*, no. 128 A.P., p. 61.

officers of the technical departments may have much to contribute towards district books; nor should the assistance of Africans be excluded. The Tanganyika Government newspaper *Mambo Leo* has provided a medium through which literate Africans have been able to place on record some of the traditions of their tribes.¹ Editorial exigencies, however, usually make it necessary to abridge such writings, and it might often be worth while keeping the original draft in a district book.

It has been suggested that valuable comparative data could be obtained by collating the material preserved in district records, and several governments have considered the appointment of a special agency for this purpose. Professor Thurnwald in his study of cultural contacts in East Africa² has used material drawn from this source.

(e) *Institutions for Teaching and Research*

The Ethnological Society of London, founded in 1843, and the Anthropological Society of London, founded in 1863, were merged in 1871 in the Anthropological Institute of Great Britain and Ireland; this became the Royal Anthropological Institute in 1907. Its *Journal* dates from 1871, and its publication *Man* from 1900. The Royal African Society, founded in 1901 as a memorial to Mary Kingsley, publishes a quarterly journal which includes articles on anthropological subjects. There are Chairs of Social Anthropology at Oxford, Cambridge, and London, and a Chair of Geography and Anthropology at Aberystwyth. In Oxford a Lectureship in African Sociology was created in 1935. The University of Manchester has an honours school of Geography and Anthropology under the control of the Professor of Geography. The London School of Economics has made a special feature of the training of investigators. The courses of training provided at Oxford and Cambridge for officers appointed to the African Administrative Service include the study of anthropology.

The financial assistance of the Rockefeller Foundation made possible the establishment in 1926 of the International Institute

¹ N. Caxton Nungula Mahenge, 'Habari za Nchi ya Bukwimba', *Mambo Leo*, March 1936; Aaron Paulo, 'Hadithi ya Sultani na Myware (Hadithi ya Kinyamwezi)', *ibid.*, April 1936; Marko Gwaja, 'Habari za Kale, Kabila la Ekoni', *ibid.*, June 1936.

² *Black and White in East Africa: The Fabric of a New Civilization*, 1935.

of African Languages and Cultures. It was originally intended to serve as a clearing-house for African information for the benefit of those engaged in official, missionary, or other work in Africa. In 1931, however, with the assistance of a further Rockefeller grant, it launched a five-year plan of research to be directed to the effect on African societies of their contact with European influences.¹ In furtherance of this plan it has made awards of two types—grants for study while on leave to officials or missionaries, and fellowships for full-time research to trained field-workers. Thirteen studentships of the first type have been awarded, while seventeen research fellowships have been held, fifteen for anthropological studies. In addition, thirteen grants have been given for part-time work or to complete special studies already begun.² The governing body of the Institute represents thirty-nine universities and learned societies in different countries, as well as the Catholic and Protestant missionary conferences; the Belgian, German, Italian, and South African governments and those of all the British and French African colonies contribute to its support, as does the International Missionary Council. Its journal, *Africa*, is a valuable source of information on the problem of culture contact in the different African territories.

Such field-work in social anthropology as has been carried out in Africa by British students during recent years has been financed largely by the Rockefeller Foundation and the International Institute of African Languages and Cultures. The former policy of the Rockefeller Foundation to include social anthropology among the subjects for which its social science fellowships were granted had an important influence on the development of studies by trained inquirers. Between 1924 and 1934, when the programme of fellowships for field research was suspended, fifteen were granted for research in Africa.

A project of co-operative research concerning Kenya is now in course of execution under the direction of the Oxford University Social Studies Research Committee which administers the grant made to the University by the Rockefeller Foundation for the promotion of research in the field of social studies. Two anthropo-

logists, an expert on colonial administration, an economist, and a geographer are collaborating under the supervision of the professors of colonial history, social anthropology, and geography. The results will be embodied in a book which it is hoped will be published in 1940.

In addition to these sources, the more recently constituted Leverhulme Trust gives fellowships for research in all subjects; a number of these have been held by anthropologists,¹ but the majority outside Africa. Other endowments earmarked for anthropology are limited to two: the Anthony Wilkins Studentship, offered by the University of Cambridge for research in ethnology or archaeology, and the Tweedie Exploration Fellowship of the University of Edinburgh, which can only be held in Asia or North Africa.

In South Africa four universities—Capetown, Witwatersrand, Pretoria, and Stellenbosch—have departments of Bantu Studies:² Capetown has a Chair, and the Witwatersrand and Pretoria have Senior Lectureships in Social Anthropology. The Witwatersrand University publishes a quarterly, *Bantu Studies*, which was founded in 1923. An Inter-University Committee for African Studies was founded in 1932, and consists of representatives of all the South African universities, the Union Departments of Education and Native Affairs, the High Commission Administration, the Government of Southern Rhodesia, and the South African Missionary Conference. A Department of Social Anthropology and Native Law, under Z. K. Matthews, himself a South African native, was recently established at the South African Native College, Fort Hare.

The Capetown Chair and the Senior Lectureship at the Witwatersrand were endowed by a grant from the South African Government for the development of a School of African Life and Languages for the training of officials. For a few years a bonus of £50 a year was paid to officials who obtained a diploma in those subjects, but this has now been discontinued, and officials are not granted facilities to take courses in Bantu studies.³ The

² See Chap. XVIII, p. 1211.

³ Ibid., and Chap. IX, pp. 368-9.

Governments of Rhodesia and the High Commission Territories have, however, allowed their officials to attend vacation courses organized by the South African universities jointly. The Native Affairs Department in the Union has an ethnological section with an anthropologist in charge.¹ The South African Association for the Advancement of Science also publishes much anthropological material.

As already shown, administrative officers have in the past been seconded for anthropological work by the governments of several British colonial territories,² but it is understood that these appointments are not at present in existence except in the Gold Coast. Northern Rhodesia has lately obtained sanction for the creation of a post of government anthropologist in connexion with the proposed Rhodes-Livingstone Memorial Institute at Livingstone, in support of which an appeal was issued in 1937;³ an ordinance⁴ has been passed establishing a board of trustees for the management of the Institute under the direction of the government. An institution of this nature, situated in a central position in Africa, and equipped to carry out a continuous study of social conditions, will have unquestioned value. The Government of the Anglo-Egyptian Sudan financed the studies of Professor and Mrs. C. G. Seligman and later Dr. Evans Pritchard,⁵ and in 1937 appointed Dr. S. F. Nadel as government anthropologist to carry out a special survey of the Nuba hills. The Bechuanaland Protectorate commissioned a study by Professor I. Schapera of the native customary law of the various tribes.⁶ The Carnegie Corporation gives grants to officials from British territories to enable them to take courses of study while on leave, and the governments allow extension of leave for this purpose.

The Société d'Anthropologie de Paris, founded in 1859, issues a series of bulletins and memoirs, and the Société d'Ethnographie, founded in the same year, issues a bulletin. The *Revue anthropologique* is the organ of the Institut International d'Anthropologie,

whose head-quarters are at the École d'Anthropologie, and which, since 1926, has published a series of *Travaux et mémoires*, many of which deal with Africa. The Société des Africanistes, founded in 1931 for the scientific study of Africa and its peoples, publishes a *Journal* which contains many anthropological studies. Courses in ethnology are given at the Institut d'Ethnologie, attached to the Sorbonne and subsidized by the Ministry for the Colonies, and the Faculty of Law of the University of Paris includes a section on ethnological jurisprudence directed by the Professor of Colonial Legislation, M. René Maunier, whose studies of the sociology of Algeria are well known. Students of the École Coloniale attend lectures in colonial history, ethnology, and customary law. It has for some time been considered necessary to increase the facilities for training in order that they should not be confined to officials of the higher grade, and it is understood that a Colonial University for this purpose may be established shortly at Vincennes. A commission, consisting of members of the legislature and experts, has recently been appointed to make a wide survey of native societies in the French colonial territories.¹

The Société d'Anthropologie de Bruxelles, founded in 1882, issues bulletins and memoirs. The Musée du Congo Belge has published a series of studies, beginning in 1902, of the peoples represented in its collections. The state Universities of Ghent and Liège give general courses in anthropology in the Faculty of Science, and courses referring specially to the Congo in the Department of Commerce. The University of Louvain gives courses in anthropology and native administration for missionaries, agricultural experts, and other candidates for the degree in colonial science. The school of political and social sciences of the University of Brussels includes anthropology among its subjects. Administrative officials of the superior grade undergo a training of four years at the Colonial University of Antwerp, which includes a detailed study of the anthropology of the Congo; a course of five months in this subject is also obligatory for all candidates for any of the colonial services who have not undergone the university training. Elementary instruction of the same type is given at the

¹ See Chap. VI, p. 188.

agricultural institutes of Gembloux, Ghent, and Louvain, in connexion with the courses on tropical agriculture.

In Germany the Berliner Gesellschaft für Anthropologie has, since 1869, published the *Zeitschrift für Ethnologie*, and the *Zeitschrift für vergleichende Rechtswissenschaft*, first published in Berlin in 1895, devotes much attention to problems of primitive law; there are Chairs of Anthropology at Berlin, Hamburg, Göttingen, Cologne, Leipzig, and Munich. There are schools for the training of intending settlers and their wives, which give elementary instruction in anthropology; of these the most important are at Witzenhausen for men and at Sonderburg for women.

In the United States a growing number of anthropologists, among them M. J. Herskovits, of the Northwestern University, are turning their attention to African studies. The Universities of Harvard, Columbia, and Pennsylvania, and the Northwestern University, have given fellowships for research in Africa, and Harvard has published a series of African Studies, initiated in 1917. There is a growing interest in the United States in research into the cultures of the negroes of America, and field-work has been done in connexion with the relation of these cultures to those of West Africa.

(f) *The Future of Anthropological Inquiries*

From the scientific, as well as from the practical, point of view there may be doubt whether the existing organization of the field inquiries now being undertaken in Africa is such as to secure the best results from the available resources. In the case of the work financed by the Rockefeller Foundation,¹ either directly or through the International Institute of African Languages and Cultures, there has been a certain co-ordination in the general lines of research undertaken, owing to the fact that most of the investigators were trained at one centre; but, although the method of inquiry has been based on common principles, the selection of problems for study has been left largely to different investigators, who have published their results mainly in the form of monographs on a restricted area. While undoubtedly the material collected provides the basis for comparative studies of native society in different parts

¹ See above, p. 52.

of Africa, such as have not hitherto been possible, no study of this kind has been attempted through a centrally controlled body which would concentrate upon the investigation either of a group of closely similar peoples, or of some particular institution, or of a special aspect of African life, such as its economic organization. In consequence, there appears to be a dispersion of energy. It is clear that a complete investigation of every African tribe is impossible; but if an intensive study, arranged on a concerted plan, were made of three or four important tribes in every territory, the results would have a value extending beyond the immediate field of study, and would compensate more amply for the cost of research.

It would facilitate the effective co-ordination of official and private inquiries, with great advantage to both, if those bodies in Europe and America which promote anthropological work would relate their policy to the practical needs of governments. It is also of importance that facilities should be provided at the universities, and in the form of manuals on technique, for government officers to be trained in anthropological investigation, both during the courses which they take before entering upon their appointments and subsequently when they are on leave. It is significant that the South Africa Native Economic Commission made a recommendation to the Union Government that

'it will be necessary to devote more attention to the scientific study of the natives than has hitherto taken place. The universities have for some time devoted their attention to this subject, and a good deal of investigation has taken place by private research. Your Commission considers that greater encouragement should be given to such work, and that steps should be taken to facilitate co-operation between officials dealing with natives and scientific investigators, to enable the results of such work to be used to assist in dealing with administrative questions dependent on a knowledge of native customs.'¹

If, however, governments are to take a more direct part in supporting sociological inquiry in Africa, they are likely to feel that certain conditions should be observed. They may claim that work undertaken with their support should pay predominant attention to points to which they themselves attach significance.

¹ *Report*, U.G. 22, 1932, para. 249.

It is true that in the social, as in the natural sciences, it is not possible to demand that only those phenomena should be investigated the study of which can be shown to have some practical relevance; the knowledge which is of real value comes from the application to specific problems of the results of general research. In the case of anthropology it is particularly necessary to realize that the intensive studies which have been described¹ represent a valuable preliminary to any special investigation of particular aspects of native life which present immediate problems of policy; but while no government could reasonably seek to prescribe the precise range which an investigator's inquiries should take, it may, with some reason, require that he should endeavour to throw all possible light on the problems which it selects as being of practical importance.

It would not be difficult to suggest numerous cases in which the assistance of an anthropologist would be of value.² The question of malnutrition has, for instance, recently attracted world-wide attention. There is now under discussion³ a plan for a joint investigation of the diet of some typical tribes in East Africa in which an anthropologist, a biochemist, a medical man, and an agriculturist would take part. A complete study of diet involves not only data as to quantities produced and consumed and their food values but also data as to the methods and customs connected with cooking, brewing, milking, slaughtering, eating, and drinking, including food taboos. Again, any inquiry into the possibility of making agricultural improvements must have its sociological aspect, involving the law of land-tenure, the system of co-operation in production, and the incentive to increased production, whether this lies in the direct desire to accumulate food, the need to meet some obligation, or the possibility of earning money.⁴ In the chapter relating to population records⁵ reference is made to the need for a more systematic collection of vital statistics; but it would not be possible to interpret correctly the material

¹ See above, pp. 42-5.

² See Chap. XVI, pp. 1106 ff.; Chap. XVII, pp. 1122-4.

⁴ See International Institute of African Languages and Cultures, Annual Report for 1936, *Africa*, vol. x, no. 1, 1937, pp. 109-10.

⁵ See Chap. IV, pp. 103-4.

thus provided without knowing the demographic effect of certain social customs. It is, for instance, important to know whether taboos on sexual intercourse over long periods limit the possibility of conception, whether abortion is practised, by what means and for what reasons, whether infanticide is, or has recently been, a custom; while the relation between customs permitting sexual freedom, the break-down of the limitations on such freedom, and the control of venereal disease is also important. The problem of soil erosion,¹ particularly in South and East Africa, is in great part attributable to over-stocking: but in seeking a solution it is necessary to take account of the importance attached to cattle in the light of the religious beliefs and ceremonies involving them, and, above all, the effect of the payment of bride-price in maintaining respect for marriage and kinship obligations.²

(g) Bibliography

For convenience of reference, a bibliography of some of the principal contributions to the study of social anthropology in Africa is given below.

The journals published by learned societies have been mentioned in sect. (e).

A number of governments finance journals which deal with subjects of local interest, including accounts of native tribes, e.g. *Nada*, the Native Affairs Department Annual of Southern Rhodesia; *Tanganyika Notes and Records*; *The Gold Coast Review*; *Bulletin du Comité d'Études Historiques et Scientifiques de l'Afrique Occidentale Française*; the monthly journal *Congo*; and *Ethnological Publications*, a series issued by the Union Department of Native Affairs. Material is to be found in the reports of agricultural and health officers, and in the proceedings of committees appointed to consider land questions and labour conditions. The most valuable of the special reports made on the subject of land tenures, in the light which they cast on the social system, are those relating to the Kikuyu in Kenya and the Yoruba in Nigeria.³ Reference is made to such material in the appropriate chapters throughout this Survey.

SOUTH AFRICA

The South African Inter-University Committee for African Studies published a general review of the work done in South Africa in *Bantu*

¹ See Chap. XVI, p. 1069.

T. Cullen Young, *Notes on the Customs and Folklore of the Tumbuka-Kamanga Peoples*, 1931; the most important work on Nyasaland.

TANGANYIKA.

There are numerous works in German on individual tribes, including O. Dempwolff, *Die Sandawe*, 1916; H. Claus, *Die Wagogo*, 1911; M. Merker, *Die Masai*, 1904; H. Rehse, *Kiziba, Land und Leute*, 1910; A. Eichhorn (Editor), *Beiträge zur Kenntnis der Waschambaa*, 1911-24; E. Nigmann, *Die Wahehe*, 1908, and a collection of texts by W. Blohm, published under the title *Die Nyamwezi*, 1931.

Das Eingeborenennrecht, 1929, is a study in 2 volumes, edited by B. Ankermann. It carried out a project, made some years before the War, for the study of native law. It is based on questionnaires circulated to missionaries and others in the former German colonies in Africa and elsewhere.

B. Gutmann, *Das Recht der Dschagga*, 1928; this is one of the fullest studies so far published of any African culture; the fruit of long acquaintance with the Chaga as a missionary. *Die Stammeslehren der Dschagga*, 1932, also by Gutmann, is a collection of the formulae used at initiation ceremonies.

C. Dundas, *Kilimanjaro and its People*, 1924, writes in amplification of Gutmann's researches.

R. Thurnwald, *Black and White in East Africa*, 1936, is a survey of the process of culture contact among the principal tribes of Tanganyika. The results of the study by Mrs. Thurnwald on the position of women are summarized in one chapter. They have been published in full in German, *Die schwarze Frau im Gestaltwandel Afrikas*, 1935.

G. G. Brown and A. McD. B. Hutt, *Anthropology in Action*, 1935; an example of co-operation between an anthropologist and a government officer; refers to the Hehe tribe.¹

A. T. and G. M. Culwick, *Ubena of the Rivers*, 1935, is a valuable study by a District Officer and his wife.

KENYA

G. Lindblom, *The Akamba in British East Africa*, 1920.

C. W. Hobley, *Ethnology of the A-Kamba, and other East African Tribes*, 1910, and *Bantu Beliefs and Magic*, 1922; the latter refers to the Kikuyu.

W. S. and K. Routledge, *With a Prehistoric People*, 1910; also deals with the Kikuyu.

A. C. Hollis, *The Masai: their Language and Folklore*, 1905, and *The Nandi: their Language and Folklore*, 1909.

G. St. J. Orde Browne, *The Vanishing Tribes of Kenya*, 1925, deals with the minor tribes of the Kikuyu district.

W. M. H. Beech, *The Suk*, 1911.

J. A. Massam, *The Cliff Dwellers of Kenya*, 1927; refers to the Elgeyo tribe.

L. S. B. Leakey, 'Goats and Sheep in the Social Life of the Kikuyu', *Journal of the Royal African Society*, vol. xxxiii, no. cxxx, 1934, pp. 70-9.

UGANDA

J. Roscoe, in *The Baganda*, 1911, made an extensive and valuable, if not entirely systematic, collection of material on the Ganda people. *The Bakitara or Banyoro*, 1923, and *The Banyankole*, 1923, by the same author, are of less value (vide H. B. Thomas and R. Scott, *Uganda*, 1935, p. 85, note 1).

J. H. Driberg, *The Lango*, 1923.

L. P. Mair, *An African People in the Twentieth Century*, 1933. These last two books follow modern methods of research.

NIGERIA

C. K. Meek, *A Sudanese Kingdom*, 1931; is a study of the Jukun by a government anthropologist. His *Law and Authority in a Nigerian Tribe*, 1937, is an important work dealing with the Ibo. The same author's 2 volumes on *Tribal Studies in Northern Nigeria*, 1931, contain reports on upwards of fifty tribes, which vary in completeness with the time that could be devoted to them. He also made a general survey of the peoples of the Northern Provinces in connexion with the 1921 census, *The Northern Tribes of Nigeria*, 1925, 2 volumes.

P. A. Talbot, another government anthropologist, has similarly covered the Southern Provinces in *The Peoples of Southern Nigeria*, 1926, 2 volumes, *Nigerian Fertility Cults*, 1927, and other works.

The Tiv People, 1933, by R. C. Abraham, and *The Tiv Tribe*, 1933,

¹ See above, p. 48.

by R. M. Downes, are based on reorganization reports by the authors and other officers. Special interest attaches to the intelligence reports which formed the basis of the reorganization of the pagan areas in Northern Nigeria and in some of the South-Eastern districts. Some of the latter, prepared between 1930 and 1934, were confined to a summary investigation of social grouping and the distribution of judicial and executive functions (see M. Perham, *Native Administration in Nigeria*, 1937, p. 221), but others, conducted by officers who have had long experience of their districts, are very thorough.

J. R. Wilson-Haffenden, *The Red Men of Nigeria*, 1930; describes the nomad Fulani.

A. J. N. Tremearne, *Tailed Head-Hunters of Nigeria*, 1912; refers to the Hausa and other tribes.

S. F. Nadel, 'Witchcraft and Anti-Witchcraft in Nupe Society', *Africa*, vol. viii, no. 4, 1935, pp. 423-47; 'Nupe State and Community', *Africa*, vol. viii, no. 3, 1935, pp. 257-303; 'Gunnu; a Fertility Rite', *Journal of the Royal Anthropological Institute*, vol. lxvii, part 1, 1937. Both the last article and a forthcoming book are based on recent research by a trained anthropologist.

C. Daryll Forde, 'Land and Labour in a Cross River Village, Southern Nigeria', *Geographical Journal*, vol. xc, no. 1, 1937; and 'Social Change in a West African Village Community', *Man*, January 1937, pp. 10-12; these are the result of modern research into the legal systems and economic organization of a Southern Nigerian village.

S. Leith-Ross, 'Notes on the Osu system among the Ibo of Owerri Province', *Africa*, vol. x, no. 2, 1937; *African Women: A Study of the Ibo of Nigeria*, to be published in 1939, results of the studies of a Leverhulme Trust Fellow.

S. Johnson, an African, *History of the Yorubas*, 1921.

GOLD COAST

C. C. Reindorf, an African, *History of the Gold Coast*, 1895.

J. M. Sarbah, an African, *Fanti Customary Laws*, 1897.

J. B. Danquah, an African, *Akan Laws and Customs*, 1928.

R. S. Rattray, government anthropologist, has published *Ashanti*, 1923, *Religion and Art in Ashanti*, 1927, *Ashanti Law and Constitution*, 1929, *Tribes of the Ashanti Hinterland*, 1932, *Hausa Folk-lore*, 1913.

A. W. Cardinall, also a government officer, *The Natives of the Northern Territories of the Gold Coast*, 1921.

M. and S. L. Fortes, 'Food in the Domestic Economy of the Tallensi', *Africa*, vol. ix, no. 2, 1936, pp. 237-76; M. Fortes, 'Culture Contact as a Dynamic Process—an Investigation in the Northern Territories of the Gold Coast', *Africa*, vol. ix, no. 1, 1936, pp. 24-55. These articles give the results of recent research by a trained inquirer.

M. J. Field, *Religion and medicine of the Gã People*, 1937.

TOGOLAND

J. Spieth, *Ewe-Stämme*, 1906; a collection of texts on native institutions.

LIBERIA

D. Westermann, *Die Kpelle, ein Negerstamm in Liberia*, 1921; a study of a Liberian tribe.

SIERRA LEONE

S. Hofstra, 'Personality and Differentiation in the Political Life of the Mendi', *Africa*, vol. x, no. 4, 1937, pp. 436-57. The result of recent research by a trained inquirer.

FRENCH WEST AFRICA

M. Delafosse, *Haut-Sénégal-Niger*, 1912, is based on the results of an inquiry carried out in 1909 with a view to the preparation of a general code of civil law for the use of the courts dealing with native cases. In the French colonies attention has been directed principally to legal studies of this nature. In 1905 the Governor-General issued a circular calling on officials to study native customs with a view to the compilation of a code of civil law. A study of the Islamic tribes was set on foot immediately after the War.

J. Brévié, lately Governor-General, *Circulaires sur la politique et l'administration indigènes*, 1931, p. 61, mentions a number of other studies, general or devoted to special branches of custom, but describes them as 'fragmentary'. He urged a more energetic application to the subject. As a result of the stimulus given by him, studies have appeared in the local *Bulletin du Comité d'Études Historiques et Scientifiques de l'A.O.F.*

L. Geismar, *Recueil des coutumes civiles des races du Sénégal*, 1933, is the first completed study of the customary law of a colony.

H. Labouret, French Director of the International Institute of African Languages and Cultures, 'Les Tribus du Rameau Lovi', *Travaux et mémoires de l'Institut d'Ethnologie*, no. xv, 1931, a study of the Lovi based on the observations of eleven years spent among them; *Les Manding et leur langue*, 1934, a manual of information and guidance for officials; *Les Bobo*, 1924, two volumes of texts on the Bobo of the Upper Volta, dealing with social life and religion, collected by Dr. Cremer and edited by M. Labouret.

J. R. Rodd, *People of the Veil*, 1926; describes the Tuareg.

L. Tauxier, *Le Noir de Bondoukou*, 1921, 2 volumes; *Nègres Gouro et Gagou*, 1924, a study of the Ivory Coast tribes.

C. Monteil, *Les Khassonké*, 1915, and *Une Cité soudanaise, Djénné*, 1932.

J. H. Saint-Père, *Les Sarakolles du Guidimakhé*, 1925.

A. Le Hérissé, *Ancien royaume du Dahomey*, 1911; the principal work on Dahomey.

Dim Delobsom, *L'Empire du Mogho-Naba*, 1933; a volume on the Mossi by an African.

M. J. Herskovits has recently carried out an investigation in Dahomey, and has published some preliminary material; 'Outline of Dahomean Religious Belief', *Memoirs of the American Anthropological Association*, no. 41, 1933; 'A Note on "Woman Marriage" in Dahomey', *Africa*, vol. x, no. 3, 1937, pp. 335-41.

FRENCH EQUATORIAL AFRICA.

General surveys have been made, but there is as yet no monograph devoted to a single tribe.

CAMEROONS.

E. Pechuël-Loesche, *Volkskunde von Loango*, 1907.

G. Tessmann, *Die Pangwe*, 1913; and *Die Bafia und die Kultur der Mitteltkamerun-Bantu*, 1934.

BELGIAN CONGO.

Particular attention has been given, above all by the judiciary, to the study of native law. The Institut Royal Colonial Belge offers prizes annually for essays on matters of colonial interest, and the questions set in the anthropological section usually deal with some aspect of customary law. Subjects for 1938 were the rules of succession, the system of customary tributes, and the influence of Belgian colonization upon their payment (*Congo*, June 1936, pp. 83-4).

A. Sohier, Procurator-General at Elizabethville, *Pratique des juridictions indigènes*, 1932; a pamphlet for the guidance of officials presiding over native courts. He edits a review, *Bulletin des juridictions indigènes et du droit coutumier*.

Two commissions, appointed in 1924 and 1930 to inquire into the effect on native life of the migration of labour,¹ brought to light data which are valuable as a preliminary to intensive research.

The inquiries of the Foréami medical organization have made a contribution of interest on the demographic aspect of certain customs.²

C. G. F. Delhaise, *Les Wariga*, 1909; J. Halkin, *Les Ababua*, 1911; C. Van Overbergh, *Les Basonge*, 1909; *Les Mayembe*, 1907; J. Van den Plas, *Les Kuku*, 1910; L. R. P. Colle, *Les Baluba*, 1913. These six studies follow a uniform plan, based on a questionnaire issued by the Société Belge de Sociologie.

J. Van Wing, *Études Bakongo*, 1921.

J. H. Weeks, *Among Congo Cannibals*, 1913; *Among the Primitive Bakongo*, 1914.

E. Torday and T. A. Joyce, *Les Bushongo*, 1910.

E. Verhulpen, *Baluba et Balubaïses du Katanga*, 1936.

¹ See Chap. XI, pp. 645 and 647.

² See Chap. IV, p. 121.

G. Van der Kerken, *Sociétés Bantoues du Congo Belge*, 1920, points out instances in which policy has failed to make due allowance for African custom.

P. Schebesta, *Bambuti, Die Zwerge vom Kongo*, 1932; *Der Urwald ruft wieder*, 1935; R. P. Trilles, *Pygmées de la forêt équatoriale*, 1932. The three last-mentioned books refer to the forest pygmy tribes.

RUANDA-URUNDI.

H. Meyer, *Die Barundi*, 1916.

J. Czechanowski, *Forschungen im Nil-Kongo Zwischengebiet*, 5 volumes, 1917-27.

N. de Cleene, 'Les Chefs indigènes au Mayombe', *Africa*, vol. viii, no. 1, 1935, pp. 63-75; 'La Famille dans l'organisation sociale du Mayombe', *Africa*, vol. x, no. 1, 1937, pp. 1-15.

PORTUGUESE EAST AFRICA.

E. D. Earthy, *Valenge Women*, 1933.

ANGOLA.

W. D. Hambly, *The Ovimbundu of Angola*, 1924; deals mainly with material culture.

COMPARATIVE STUDIES.

There are not many studies which treat the same aspect of African life as it appears in different tribes.

W. C. Willoughby, *The Soul of the Bantu*, 1928; *Nature Worship and Taboo*, 1932; these books deal with religious beliefs and rites in South and East Africa.

A. I. Richards, *Hunger and Work in a Savage Tribe*, 1932; deals with food, and the part played by its production and consumption, in South and East Africa.

E. E. Evans Pritchard, *Witchcraft, Oracles and Magic among the Azande*, 1937; refers to the Anglo-Egyptian Sudan, but deals with a sociological phenomenon of importance throughout Africa.

Africa, vol. viii, no. 4, 1935, was devoted to the subject of witchcraft. It included a number of articles referring to individual tribes, which have been noted above; also articles on 'Witchcraft', by E. E. Evans Pritchard, 'Witchcraft and British Colonial Law', by G. St. J. Orde Browne, 'Witchcraft and Colonial Legislation', by C. Clifton Roberts, and 'Ethical and Political Aspects of African Witchcraft', by F. Melland.

The problem of culture contacts has similarly received attention in *Africa*, on a scale which embraces many tribes: A. I. Richards, 'Anthropological Problems in North-Eastern Rhodesia', vol. v, no. 2, 1932, pp. 121-45, and 'The Village Census in the Study of Culture Contact', vol. viii, no. 1, 1935, pp. 20-33; M. Hunter, 'Methods of Study of Culture

Contact', vol. vii, no. 3, 1934, pp. 335-50; L. P. Mair, 'The Study of Culture Contact as a Practical Problem', vol. vii, no. 4, 1934, pp. 415-22; A. T. and G. M. Culwick, 'Culture Contact on the Fringe of Civilization', vol. viii, no. 2, 1935, pp. 163-70; I. Schapera, 'Field Methods in the Study of Modern Culture Contacts', vol. viii, no. 3, 1935, pp. 315-28; M. Fortes, 'Culture Contact as a Dynamic Process', vol. ix, no. 1, 1936, pp. 24-55; G. Wagner, 'The Study of Culture Contact and the Determination of Policy', vol. ix, no. 3, 1936, pp. 317-31.

E. W. Smith, *The Golden Stool*, 1926; a general survey of the results of European contact on native societies.

D. Westermann, German Director of the International Institute of African Languages and Cultures, *Africa and Christianity*, 1937, and *The African To-day*, 1934.

In 1930 the co-operation of government officers, missions, and certain European residents was sought by a Committee on the Human Geography of Inter-Tropical Africa constituted by the British Association for the Advancement of Science. It expressed the view that in anthropological studies 'the relationship of people to country is almost universally missing' (*The Human Geography of Inter-Tropical Africa*, 1930), and called attention to the need for showing how the environmental factors of climate, soil, and the like, condition the lives of African societies. A list of nineteen questions was circulated to governments. A number of replies was received; the accounts of the Mlanje District of Nyasaland by L. H. L. Foster, and the Kasulu District of Tanganyika by E. A. Leakey and N. V. Rounce, were published in *Geography* in 1932 and 1933 respectively. The Government of Northern Rhodesia invited all its district officers to answer the questionnaire, and the whole of this territory has been covered by a series of thirty-three reports. Their results were summarized by Professor A. G. Ogilvie, the Chairman of the Human Geography Committee, in his presidential address to the Geography Section of the British Association in September 1934. Studies based on the questionnaire were made by S. J. K. Baker, of the Geography Department of the University of Liverpool, on the Ankole District of Uganda and the South Nyeri District of Kenya, in the course of a four months' tour of East Africa. Such surveys are comparable with the survey work of the early anthropologist, but the method of circulating questionnaires to observers who may not have given much previous thought to the subject of inquiry, and lack the context of knowledge in which it was drafted, has serious disadvantages.

CHAPTER III

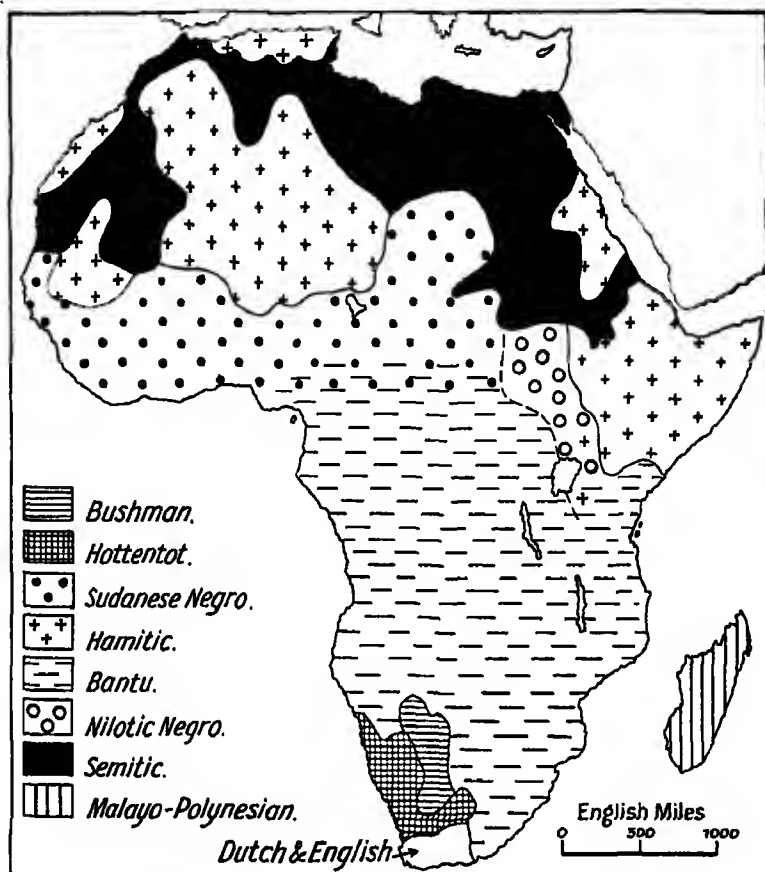

THE STUDY OF THE AFRICAN LANGUAGES

I. INTRODUCTION

THE exact number of the languages spoken in Africa is not known, but it is customary to speak of them as numbering 700. The first impulse to their study came from the need felt by missionary bodies for means of preaching to Africans in their own tongue and for making translations of the Bible. They encountered the difficulties inherent in research into the language of illiterate peoples; not only must the student dispense with the assistance from documents that is available in the case of languages which have been reduced to writing, but his task includes, in addition to analysis and translation, the devising of a system of transcription which will at the same time convey pronunciation and structure to persons to whom the language is unfamiliar, and be capable of manipulation by the native who is to be taught to read and write his own tongue. Despite these difficulties, between two and three hundred African languages have been reduced to writing by missions,¹ and some of the best work of a scientific nature has been done by missionaries.

The second stage began with the acceptance by missions and later by governments of an increasing measure of responsibility for education, and the assignment to African languages—both as medium and subject—of a place in schemes of popular instruction. A period of intensive philological study, associated with the work of scholars such as Alice Werner, Kropf, Bleek, Meinhof, and Westermann, linked the two stages. The publications of these scholars laid the foundations upon which the study of African languages could be based. This development created a series of new problems in linguistic study and educational policy. The impossibility of giving education in every one of the 700 vernaculars raises the question as to which should be chosen for this purpose and consequently in which school-books should be produced and original literature encouraged. In some areas the question has solved

¹ In the Editorial Report of the British and Foreign Bible Society issued in 1998, the number of publications in African languages is given as Bibles 33, New Testaments 70, Portions 173—a total of 276.

PRINCIPAL LANGUAGE GROUPS

Based on a map in Mr. Walter Fitzgerald's AFRICA by kind permission of Messrs. Methuen

itself by the early translation of the Bible in one dialect, which has thus acquired the prestige of a literary language. Some territories have adopted a current African lingua franca, others have selected for school use languages understood over the widest possible area, and in a few cases 'union' languages have been constructed for various dialect groups. In this last method, instead of choosing one dialect out of each group to predominate, an effort is made to construct a common language for the group by employing forms which are common to all the variants, or, where this is not possible, by the use of forms common to a predominant majority.¹ Schemes of this kind are detailed under the heading of the areas in which they occur.

The growth of a literate African population creates a demand for vernacular newspapers and makes possible the recording of the deliberations of native councils, the publication of rules and decisions of native authorities, and the communication in print of government orders and of popular interpretations of official policy, such as are circulated at present in the vernacular newspapers published by one or two administrations. Towards the creation of a literate population, grammars and text-books suitable for the African pupil must be devised and general literature is needed if the habit of reading is to be kept up when the pupil has left school.² This may be provided in the form of translations of European works, but it is also necessary that vernacular literature should grow up, and native pioneers in such a new method of expression need assistance and encouragement. That the supply of suitable reading material either for school or general use is wanting is illustrated by the report for 1935-6 of the Gold Coast Education Department, where it is stated that the vernacular receives scant attention in senior classes because of the lack of written material; and this is one of the most advanced colonies so far as education is concerned. Mention may be made, however, of the stimulus given to African writers by the annual competitions of the International Institute of African Languages and Cultures, and by an interterritorial Swahili essay competition, which have been both popular and successful.

Distribution of vernacular literature in tropical Africa is largely

¹ G. P. Lestrade, 'Some Reflections on the Future of South African Bantu Languages', *The Critic*, vol. iii, no. 3, 1934, p. 137.

² See Chap. XVIII, pp. 1257-9.

under the control of missionary bodies which have created book-shops and book depots. The C.M.S. Bookshop at Lagos, with its auxiliary depots, dealing with secular as well as religious literature, is one example of a large book-distributing agency under mission auspices. Mission printing-presses in Africa and religious publishing houses in Great Britain print a considerable amount of the vernacular literature issued.¹ A bibliography of African Christian literature, and a supplement, published respectively in 1923 and 1927, list religious and secular books in over 200 African languages. Following on this survey the International Missionary Council set up the International Committee on Christian Literature for Africa in 1929. This committee supplies information on literature through its quarterly bulletin, *Books for Africa*, and assists in the co-ordination of advance plans and in procuring and arranging for the publication of manuscripts. Improvements in transport are making possible the setting up of language and literature committees in different language areas and thus facilitating the co-operation of different workers, which is necessary for the successful production of books. These committees are noted later in this chapter under each special area.

It will be convenient to give, first, some account of the institutions now existing for the study and teaching of languages. This will be followed by a study of the present state of knowledge regarding the classification of the African tongues. There will next be given some information regarding the progress made in pursuing the study of one of the most important of the new problems which have arisen—namely, that of orthography—and a summary of the action taken in regard to the study and use of the vernaculars in each of the territories.

II. INSTITUTIONS FOR THE STUDY AND TEACHING OF AFRICAN LANGUAGES

The principal institutions are:

Austria. Institut für Ägyptologie und Afrikanistik an der Universität Wien, Vienna: Berber dialects, Kanuri, Swahili, Ful, and Nubian dialects.

¹ See Chap. XVIII, pp. 1293-7.

Belgium. Université Coloniale de Belgique, Antwerp: Bantu linguistics and Swahili.

Université de Louvain: Swahili, Ngala, Luba.

France. École Nationale des Langues Orientales Vivantes, Paris: Berber, Amharic, other Abyssinian languages, Ful, Mandingo, Sudanese languages, West African languages, Malagasy.

The Collège de France, Paris, the École Nationale de la France d'Outremer, and the Institut Colonial et Agricole at Nancy, have a course in Arabic.

Germany. Seminar für Orientalische Sprachen an der Universität Berlin: general problems of African linguistic research, general courses in African languages, Bantu grammar and phonetics, Arabic, Amharic, Tigrinya, Swahili, Comoro languages, Ewe, Hausa, Yaunde.

Seminar für Afrikanische und Südseesprachen, Hamburg: Ethiopic, Amharic, Tigre, Tigrinya, Galla, Somali, Hausa, Nama, Ful, Konde, Herero, Duala, Swahili, Zulu, Bangala, Ewe, Vai.

Great Britain. School of Oriental Studies, London: Swahili, Kikuyu, Ganda, Nyanja, Rundi, Shona, Sotho-Tswana, Zulu-Xhosa, comparative grammar of Bantu languages, Hausa, Ibo, Efik, Twi, Yoruba, Dinka, Nuer, Shilluk, Bari, Moru, Acholi, Arabic, Amharic, Galla: phonetics and linguistics.

At Oxford and Cambridge the Colonial Office makes provision for the instruction of probationers in Mende, Twi, Yoruba, Ibo, Efik, Hausa, Nyanja, and Swahili. This teaching is given by retired political officers or missionaries from the language areas concerned. It is the aim of the Colonial Office to build up a cadre of selected tutors who are qualified to give the probationers, in addition to language teaching, some practical knowledge of the career before them.

Italy. Scuola Orientale, Università Reale di Roma: Ethiopic, Amharic, Tigre.

Reale Istituto Orientale di Napoli: Amharic, Tigrinya, Berber.

Union of South Africa. Witwatersrand: Bantu philology, phonetics, Zulu, Sotho, Shona, Xhosa.

Capetown: Bushman languages, Xhosa, Sotho, Venda, Thonga, Tswana, and Bantu phonetics.

Stellenbosch: phonetics, Tswana, Pedi, Zulu, Xhosa, Nyanja, Karanga, introduction to the study of Hamitic and Sudanic languages.

Fort Hare: Sotho, Xhosa, Zulu, Tswana.

Pretoria: Zulu, Sotho, Bantu philology.

The University of South Africa conducts examinations in Bantu languages for a large number of external students.

In the main these institutions concentrate on the study of languages in the territories with which their governments are connected. The Université Coloniale at Antwerp is a state institution,

of which the principal function is the training of cadets for the colonial service. The *École Nationale des Langues Orientales Vivantes* is controlled by the French Ministry of Public Instruction; the attention given by it to the study of the African languages, other than Arabic, Malagasy, and Sudanese, is a modern development. The *École Nationale de la France d'Outremer* (the 'École Coloniale') is a state institution for the training of colonial cadets; its courses in African languages are limited to Arabic and Malagasy. Contributions to research in African languages have been made by the French scholars, Delafosse, Labouret, and Mademoiselle Homburger, while Drs. Laman, Burssens, van Bulck, and Father Hulstaert have done notable work on Congo languages. The Universities of Hamburg and Berlin continue to devote to African languages the study that made German scholarship in this field pre-eminent before the war. The support given to these studies by the German Government has in no way diminished. Professor Westermann of Berlin is one of the most notable figures in the African linguistic field of the present day, while the contributions of Professor Meinhof at Hamburg and Professor Klingenhoben, now at Leipzig, are well known. Dr. J. Lukas should be mentioned among the younger German scholars.

In Great Britain one of the first pioneers in the African research field was the late Alice Werner, who from 1917 to 1930 held a lectureship which was converted into a professorship at the School of Oriental Studies. With her should be mentioned the missionaries such as Dr. E. W. Smith, Dr. G. P. Bargery, and Dr. C. M. Doke. The researches of Professor Daniel Jones, continued by Dr. Ida Ward, Dr. A. N. Tucker, and Miss L. E. Armstrong in recent years, have developed the study of African linguistic problems in this country on modern academic and practical lines.

In 1932 the African Department at the School of Oriental Studies was considerably expanded; as at present organized it provides elementary courses in the main African tongues and arranges from time to time for special lectures by experts on particular languages; training is also given in methods of study for students anxious to work on languages in which instruction cannot be provided. The type of instruction that can be given is illustrated by a memorandum by Dr. Ida Ward, *Practical Suggestions for the*

*Learning of an African Language in the Field.*¹ It is a noteworthy fact that the British Government has not given the same direct assistance as Belgium, France, or Germany to institutions directed to the study or teaching of languages. The School of Oriental Studies, for instance, receives its main support from the University of London (and through this body a small share of the Treasury grant to universities) and has a grant from the Indian Government; the African Department largely owed its existence to an annual grant from the Rockefeller Foundation, which expires in 1939. With the assistance of this grant the School has been able to finance, wholly or partially, research expeditions to Nigeria (Dr. Ida Ward, Dr. Melzian, Dr. Lukas) and the Sudan (Dr. Tucker), and to publish some of the material collected on these tours.

In South Africa the Inter-University Committee for African studies has for a long time concerned itself with the co-ordination of research in this field and was responsible *inter alia* for the publication of the survey of work to which reference is made later in this chapter.² The university institutions in South Africa are largely financed by the State, but no subsidy is now given specifically for Bantu studies.³ The Universities of Capetown and Johannesburg have professorships of Bantu languages, whose holders, Dr. G. P. Lestrade and Dr. C. M. Doke, are among the foremost African scholars of to-day.

In the United States there are no institutions providing teaching in African languages, but research work in African languages has been carried out by linguists such as Professor Sapir (*The Gweabo Language of Liberia*, &c.), Dr. G. Herzog (*Jabo Proverbs*), and Professor M. J. Herskovits (*Kru Proverbs*, &c.).

Mention should also be made of the assistance given to linguistic research by the International Institute of African Languages and Cultures, whose work is more fully described in connexion with anthropological studies.⁴ The publication of an early memorandum on orthography⁵ was followed by a short linguistic guide for taking down new languages,⁶ a book on the phonetics of African

¹ Supplement to *Africa*, vol. x, 1937.

languages,¹ and the pamphlet on learning an African language, referred to above. It has now an Advisory Linguistic Committee to which questions may be submitted. Grants have also been made for the study of Kanuri by Dr. J. Lukas, Bini by Dr. H. J. Melzian, Bali by Dr. E. Meyer, and the languages of the Southern Sudan by Dr. A. N. Tucker and Father J. P. Crazzolaro. The linguistic activities of the Institute and the visits of Professor Westermann to different areas of Africa have stimulated linguistic research in Africa and Europe.

III. THE CLASSIFICATION OF AFRICAN LANGUAGES

Early students of African languages found much interest in the attempt to deduce the history of tribal migrations from linguistic similarities; the supposedly most primitive forms of words common to a number of languages were held to indicate the ultimate place of origin of the peoples speaking them. Thus Sir Harry Johnston's *Comparative Study of the Bantu and Semi-Bantu Languages* illustrates by a map the conjectured routes of migration of all the Bantu tribes from a single centre on the eastern shores of Lake Chad. Modern students would hesitate to accept evidence of this type as sufficient ground for such an elaborate historical reconstruction.

Dr. E. W. Smith, in his address to the Royal Anthropological Institute in 1935 already quoted,² has given a summary of the present extent of our knowledge regarding the classification of African languages. He traces the first scientific classification to Professor R. Lepsius, of Berlin, who, writing before 1880, divided them into three groups: (1) Semitic, (2) Hamitic, (3) Primitive African, including (a) Bantu, and (b) mixed Negro. He placed Hottentot-Bushman in the Hamitic group and regarded the Negro languages as the diversified product of the mixture of the Hamitic and Bantu. F. W. Müller proposed a division into six groups, namely: (1) Semitic, (2) Hamitic, (3) Nuba-Fula, (4) Negro, (5) Bantu, and (6) Hottentot-Bushman, a classification also adopted by R. N. Cust.³ The Nuba-Fula group has now disappeared from the list, the languages which comprised it having been found to belong to other groups. The languages of the

¹ D. Westermann and I. C. Ward, *Practical Phonetics for Students of African Languages*, 1933.

² See Chap. II, p. 42.

³ *A Sketch of Modern Languages of Africa*, 1883.

continent are now divided by Dr. Westermann¹ into three families: (1) the Khoisan family, (2) the Negro languages, including (a) Sudanic, (b) Bantu, and (c) Nilotic, and (3) the Hamito-Semitic family.

The Khoisan languages are those spoken by the Bushmen and Hottentots; they have been placed together because, though Hottentot has Hamitic features, its closest relationship appears to be with Bushman; the connexion, however, with the latter is, at the best, remote. The numbers using these languages are few, for there are only about 17,500 surviving Bushmen, and although the Nama variety of the Hottentot language is spoken by about 50,000 people, it is progressively being replaced by Afrikaans. They represent, nevertheless, a linguistic problem of much interest. The Bushman dialects, of which as many as seventeen have been distinguished, falling into three main groups,² have been studied by Dr. W. H. I. Bleek, Miss L. C. Lloyd, Miss D. F. Bleek, and Dr. C. M. Doke. The Hottentot languages, which fall into four groups, of which only Nama and Korana are now spoken, have been the subject of considerable research, mainly by German students; an outstanding example of the phonetic system has been made by Dr. D. M. Beach.³

As regards the Negro, the second division of the languages as classified by Dr. Westermann, the name adopted may, perhaps, be taken rather as a convenient term of description, necessitated by the present state of our knowledge, than as an attempt at scientific definition. Of the families falling within this division the Bantu has been more fully studied than either the Sudanic or the Nilotic. The Bantu-speaking part of the continent has been described above.⁴ The north-west of Madagascar is also Bantu-speaking. The essential unity of several typical Bantu languages was shown in 1862,⁵ and the subsequent work of Dr. C. Meinhof established the study of Bantu on a scientific phonetic basis. The phonetics of Bantu have in later years been investigated by Drs. Doke, K. Laman, A. N. Tucker, Nekes, and others, and the influence of the London School of Phonetics, under the leader-

⁵ W. H. I. Bleek, *Comparative Grammar*, 1862.

ship of Dr. Daniel Jones and Professor A. Lloyd James, has been widely extended in the same direction through its students, notably those attached to universities of South Africa. Dr. E. W. Smith summarizes the work still remaining to be done for the Bantu family as follows: the languages need scientific classification on the basis of phonetics, the noun classes, the vocabulary, and sentence building; the only classifications at present available are in the main geographical. A really sound classification presupposes accurate all-round knowledge of all the languages of the family, and as yet this is not attainable; there are many languages not yet recorded, and some of which the records are still incomplete.

The second family of Negro languages in Dr. Westermann's classification—namely, the Sudanic, spoken in the areas roughly situated between the Sahara and the equator, spreading from the Upper Nile region to Senegambia—contains tongues which up to a recent period were not recognized as having any affinity and which still appear extremely divergent. The researches of M. Delafosse and Dr. A. N. Tucker, however, support the hypothesis of a common relationship, though the classification into groups still presents great difficulties. M. Delafosse¹ divided them into sixteen groups, mainly on a geographical basis; Dr. Westermann, though Dr. A. N. Tucker² does not accept all his conclusions, now proposes a fourfold division: (a) Nigritic, or Old Sudanic, including in the west the so-called Kwa group (Ibo, Yoruba, Nupe) and the Ewe-Akan group (Ewe, Twi, and Fante); and in the east languages such as the Moru-Madi, Bongo-Baka-Bagirmi, and Ndogo-Bviri; (b) the Mande languages (Mandingo, Bambara, &c.), which grammatically represent a close unity, and in respect of structure and to a large extent of vocabulary approach the Nigritic; (c) the 'class'-languages, of which there is a chain across the Sudan from Kordofan to the mouth of the Senegal. Included in these are the languages of the Benue-Cross rivers (for example, Tiv), the Gur languages in the north of Togoland and the Gold Coast (Mossi-Dagbane, &c.), and the West Atlantic languages

¹ 'Les Langues du Soudan et de la Guinée', in *Les Langues du monde*, 1924.

² 'Survey of the Language Groups in the Southern Sudan', *Bulletin of the School of Oriental Studies*, vol. vii, part 4, pp. 861-96, 1935.

between the Ivory Coast and the mouth of the Senegal; (d) the Inner Sudan group occupying the territory between Nigeria and the Anglo-Egyptian Sudan. M. Eboué and other French writers have listed these languages, but an accurate survey of the Cameroons and French Equatorial Africa has not yet been made. The Inner Sudan group would seem to be far removed from the original Sudanic type.

A minor but interesting problem, still unsolved, is the position occupied by the language of the Negritos, the pygmies of the equatorial forest; the researches of Father Trilles¹ and Dr. Paul Schebesta² leave it doubtful whether the language now spoken by them is original, nor is it possible to define the precise nature of its affinities with the Bantu or Sudanic group. Recent researches, however, show that Efe, the most 'genuine' of pygmy languages, is Sudanic and has close affinities with Momvu and Lese; it is also related, though not so closely, to the Moru-Madi group. It would appear that, as regards the Sudanic languages as a whole, much research is still required before any definite conclusion can be established as to the relationship of the different tongues comprised; there are among them many more unrecorded languages than in the Bantu group, and it is not until a more comprehensive knowledge has been acquired that it will be possible to carry beyond the stage of conjecture the question of their general relationship to the Bantu languages.

The third family included in the Negro division—namely, the Nilotic—comprises tongues spoken in the Upper Nile region as far south as Lake Victoria. Two main branches are distinguished, Nilo-Sudanic (Shilluk, Dinka, Nuer, Anuak, Acoli) and Nilo-Hamitic (Bari, Masai, Nandi-Kipsigis, Tatoga). They show an equal blending of Sudanic and Hamitic traits, the more southerly, such as the Bari and Masai, being fundamentally Hamitic. The characteristics of the Nilotic and Nilo-Hamitic have been described by Dr. A. N. Tucker.

The third main division of languages, the Hamito-Semitic, presents relatively little difficulty; their genetic relationship has been adequately demonstrated.³ The characteristics of the Hamitic

¹ *Les Pygmées de la forêt équatoriale*, 1932.

² *Die Bambuti*, 1932.

³ G. A. Barton, *Semitic and Hamitic Origins*, 1934.

have been investigated by Dr. C. Meinhof.¹ Possibly the most interesting matter requiring fuller research is the extent of the influence which these languages have had on the Sudanic and Bantu families respectively. Arabic has had its influence both on Swahili and Hausa, both languages of growing expansion; the latter is Hamitic in grammar and Sudanic in vocabulary, and has also borrowed a large number of Arabic words.

IV. THE PROBLEM OF ORTHOGRAPHY

The early missionaries, working at a time when the study of phonetics was in its infancy, generally represented the sounds of African languages by the nearest symbols for sounds in their own. Consequently, where a language area was divided by a political boundary, or where missionaries of two nationalities were at work among the same tribe, rival orthographies grew up. A great number of different methods were devised even by investigators of the same nationality for representing the same sounds. The disadvantages of this were early recognized, and efforts were made to secure the adoption of a uniform system of orthography for all African languages, but it has not proved easy to secure agreement as to what that system should be. An orthography intended to be of general application was designed by Lepsius in 1850 at the request of the various Protestant missions.² A second edition was published in 1863, and further improvements in the original system have been made by Dr. Meinhof with special reference to Africa, and by Pater Schmidt in his 'Anthropos' alphabet. The accuracy of representation given by the Lepsius system, as modified by Dr. Meinhof, makes it an admirable instrument of scientific research; but there are practical difficulties in the way of its wider use. It is constructed by the addition of diacritic marks to the letters of the ordinary Roman alphabet, and the use of these marks has been found to have certain practical disadvantages. They tend to be overlooked by the careless reader; they are generally omitted in writing, and their addition to a printed letter puts an unnecessary strain on the reader's eye. Type with

¹ *Die Sprachen der Hamiten*, 1910.

² D. Westermann, in *Proceedings of the Rejaf Language Conference*, 1928, p. 15.

diacritic marks is, moreover, expensive, as it is more fragile than ordinary type and requires more frequent renewal.¹

For these reasons one of the first activities of the International Institute of African Languages and Cultures in 1928 was to lay down principles upon which a simpler and more uniform system of orthography should be based. It is manifestly impossible to have absolute uniformity throughout Africa, nor is this necessary, but the confusion of spellings of one language and of closely related languages has made it imperative that some system should be devised which will ensure that the sounds of the spoken word shall be adequately represented in writing, with the maximum practical utility and intelligibility to the African reader as its aim rather than exact representation to the foreign student. The new alphabet, which has acquired the name of the 'Africa' orthography, is based on the alphabet introduced by the Association Phonétique Internationale, and its guiding principle is that sounds for which the Roman alphabet provides no symbols should be represented by new letter-forms instead of diacritic marks. In the revised edition of the Institute's memorandum on orthography, its aim is given as 'to show how existing orthographies may be modified and improved';² it does not itself provide ready-made alphabets for every African language. This orthography has been criticized by Dr. Meinhof on the ground that uniformity is unnecessary; in his view a script should be used whose symbols as far as possible represent the same sounds in the vernacular and the European language locally used.³ Where, however, linguistic and political boundaries do not coincide, such a scheme is complicated by different governmental language policies, e.g. Mandingo (French and British), Hausa (French and British), Kongo (Belgian and Portuguese), Swahili, and the kindred dialect of Kingwana (Tanganyika and Belgian Congo).

Difficulties, both economic and psychological, lie in the path of the would-be spelling reformer. Existing stocks of literature, the expense and difficulty of adding new symbols to sets of type previously used in printing, the exigencies of modern mechanical

² *Ibid.*, p. 7.

³ 'Principles of Practical Orthography for African Languages', *Africa*, vol. i, 1927, no. 1, pp. 228-36.

means of transcription, such as the typewriter, make for reluctance to adopt a change of spelling. The psychological effect of a proposal to change an existing spelling is also of considerable weight; and although in several areas representative committees have accepted a new form of orthography and decided upon its use, the decision has not always been implemented, and it has sometimes been decided later to revert to the old style of writing. The large proportion of education left by government to missions has often invalidated the official decision to adopt a new orthography and in many cases the government has not pressed its decisions.

One of the main arguments brought forward against a reformed African spelling is that the letters do not conform to a so-called standard English alphabet, but in making this statement the fact is overlooked that existing alphabets do not conform to English; the letters *i* and *u*, for example, have, and must continue to have, their continental value; and the English values must be learnt *per se*. The difficulties of learning the new letters or new values of letters, great as they may appear to the older generation, tend to be exaggerated, as has been shown in those areas where a vigorous policy has been carried out and books are appearing rapidly; and it should be remembered that children learn the new alphabet as easily as the old, in many cases more easily since it is more accurate.

Dr. Westermann, the German Director of the International Institute of African Languages and Cultures, visited the Gold Coast in 1927, the Southern Sudan in 1928, and Nigeria and Sierra Leone in 1929 in order to investigate local languages and explain the method of their representation by the 'Africa' script. All these territories officially adopted the orthography agreed upon at these conferences. In the Sudan a linguistic adviser was appointed to carry out the decisions of the Rejaf Conference, and a considerable amount of useful literature has been produced. Standardization is not yet complete, since the whole linguistic area is a complicated one. In the Gold Coast the new orthographies are in use and literature is growing rapidly. The situation in Southern Nigeria is described on p. 91: in Northern Nigeria a modified form of the 'Africa' script has been adopted for Hausa and Tiv. In Sierra Leone the 'Africa' orthography is used for Mende and Temne,

though few vernacular publications have been issued. The Central Orthography Committee in South Africa was responsible for the revision and unification of the orthographies of Zulu, Xhosa, Northern Sotho, and Tswana: in these some, but not all, of the recommendations of the International Institute have been followed. At the present moment the unification of the orthographies of Nyanja, Lozi (Kololo), Bemba, and Thonga is being discussed in the hope of bringing these four vernaculars into line. In over forty vernaculars some form of the 'Africa' script is being used. It will be seen that the aim of the International Institute to provide a simple and adequate orthography has in some measure been attained.

V. ACTION TAKEN IN REGARD TO THE NATIVE VERNACULARS IN THE DIFFERENT TERRITORIES

(a) *The Union of South Africa*

In the Union a sub-committee of the Inter-University Committee for African Studies was appointed in 1932 to deal with the question of linguistic research and of the development of vernacular literatures. In its report the convener, Dr. C. M. Doke,¹ was able to present the most exhaustive survey of the linguistic situation that exists in any African territory. The principal linguistic problem of South Africa is the selection and standardization of those Bantu languages which should be encouraged for literary purposes, a question closely bound up with that of the vernaculars to be used in education. The great majority of the native population of the Union are Bantu-speaking, and among them education has advanced to a point where there is a demand for literature; the problem is, however, complicated by the fact that seven separate Bantu languages are officially recognized for educational and other purposes, Zulu, Xhosa, Tswana, Southern Sotho, Northern Sotho, Thonga-Shangaan, and Venda.² According to Dr. Doke, the South

¹ 'A Preliminary Investigation into the State of the Native Languages of South Africa, with suggestions as to Research and the development of Literature', *Bantu Studies*, vol. vii, 1933, pp. 1-98.

² See *Report of the Interdepartmental Committee on Native Education*, 1935-6, U.G. No. 29, 1936, para. 439. In referring to languages, the modern form of names is used, since the language groups are not confined to the areas to which they have given their names. Thus 'Sotho' is used for the languages spoken not only by the Basuto but by others in neighbouring areas. See also Chap. II, p. 21, footnote 1.

African vernaculars can be classified into geographical zones whose languages show broad common characteristics but are not necessarily mutually intelligible; these zones are subdivided into 'groups' of languages with a 'high degree of mutual intelligibility as well as an extreme sharing of grammatical, phonetical, and lexicographical phenomena'. South Africa proper and the mandated territory form two linguistic zones.

The languages of the first zone fall into four groups—Ngoni, Sotho, Venda, and Thonga. Within each group a speaker of any one dialect can with little difficulty make himself understood in any other. Thus a speaker of Southern Sotho can make himself understood in the whole of the Sotho-speaking area, from the Kalahari in the west to the borders of Natal in the east, and from the Rhodesian border in the north to the northern districts of the Transkei in the south. The Ngoni and Sotho account for 5,500,000 of the Bantu population of the Union and the High Commission territories.¹ The Ngoni group comprises two recognized clusters, the Xhosa and Zulu languages, while Swazi, formerly regarded as a dialect of Zulu, is now held by some authorities to be the chief member of a third; together they are spoken by over 3,000,000 people; mention may also be made of Rhodesian Ndebele, a dialect of Zulu, Transvaal Ngoni-Ndebele, another dialect of Zulu, and Transvaal Sotho-Ndebele, a mixed Zulu-Sotho dialect. These are not to be used, however, for educational purposes. A good deal of literature has been produced in Xhosa by native writers; very much less in Zulu. Dr. Doke holds that Swazi will never become a literary vehicle and is sufficiently served through the medium of Zulu, but literary developments in this language appear to be beginning. A standard Zulu dictionary is being prepared by the Bantu Studies Department of the Witwatersrand University in co-operation with the Natal Native Education Department. The Sotho group, comprising considerably over 2,000,000 speakers, has three well-marked divisions, Northern (Transvaal) Sotho, Southern Sotho (the language of Basutoland and adjacent portions of contiguous territories), and Tswana (the language of about 90 per cent. of the inhabitants of the Bechuana-

¹ C. M. Doke, 'The Linguistic Situation in South Africa', *Africa*, vol. i, no. 4, 1928, p. 479. See also G. P. Lestrade, *op. cit.*, p. 135.

land Protectorate). Opinions differ as to whether unification would be best attained by a blending of all three groups or by the deliberate development of Southern and suppression of Northern Sotho. Southern Sotho has already produced vernacular writers of distinction; the well-known life of Chaka, by Mofolo, is in this language. Dr. Doke's own view is that Southern Sotho should be the basis of a common language enriched by words from the other dialects.¹ A Tswana Language Board is studying the possibility of unifying the many dialects of this cluster and agreement has been reached on orthography. Several of Shakespeare's plays have been translated into Tswana by S. T. Plaatje, the *Comedy of Errors* being the only one published so far, while *Julius Caesar* is in course of publication, the latter edited after Plaatje's death by Dr. G. P. Lestrade.

Venda has only about 150,000 speakers, but it cannot be included in any other language cluster. Its literature is still only developed for pioneer missionary purposes, and the Inter-University Committee call attention to the need for the provision of elementary school-books of all types. Thonga is spoken by about 750,000 persons, the main body being in Portuguese East Africa. Since, however, the Portuguese Government does not allow the publication of vernacular literature other than translations of the Bible accompanied by a Portuguese version, there is little possibility of an agreed policy for the whole Thonga-speaking area. The Thonga group comprises three main clusters, Thonga, Ronga, and Tswa. A Tswa grammar was published by J. A. Persson in 1932, which the committee suggest should be made the basis of a grammar of the whole group showing dialectal differences.

The second zone, the mandated territory of South West Africa, contains two groups, Herero and Ambo. On both the information is very meagre, and a general survey, extending into Angola, is required in order to ascertain the populations involved and the relative importance of the various dialects. In making such a survey political questions would again arise because of the language policy in Portuguese territories.

The development of vernacular literature in South Africa has

¹ C. M. Doke, *op. cit.*, p. 482.

been much assisted by the policy of the Cape Province of paying half the cost of school text-books¹ and by the work voluntarily undertaken by Mr. W. G. Bennie, late Chief Inspector of Native Education in the Cape Province, as adviser to native writers; he has also edited a series of Stewart Readers, which contain African contributions in prose and verse. The Lovedale Press, the Morija Sesuto Book Depot, the Tiger Kloof Book Room, and the Department of Bantu Studies in the Witwatersrand University are among the chief bodies which finance the publication of original vernacular literature. Many manuscripts of merit in Xhosa are held up for publication by lack of funds. The Interdepartmental Committee on Native Education, appointed in 1935, made two important recommendations with regard to vernacular literature—that a sum of money should be provided annually from the Native Education Fund, to be awarded in prizes for original works in Bantu languages, and that committees should be appointed to formulate such terminologies as were required in the subjects of school instruction for each Bantu language or language group.²

A conference of Bantu authors was convened in October 1936 through missionary enterprise, as a result of which a Literature Committee was set up under the South African Christian Council with sub-committees for different language areas. The Southern Sotho Committee has been active in preparing a bibliography of Sotho publications and is taking up the question of gaps needing to be filled, manuscripts awaiting publication, and method of distribution.³ A second conference, held in September 1937, recommended the formation of one Central Literature Board for the South African Bantu, that this board should found a Bantu Academy, membership of which would be conferred on those who have done meritorious work in Southern Bantu languages, and that literature committees be set up for each language or language group.⁴ The activities described above show a lively interest in native literature, and practical help afforded to native writers, which might well be followed in other parts of Africa.

⁴ *Ibid.*

(b) Southern Rhodesia

In Southern Rhodesia it was decided, when the Department of Native Education was inaugurated in 1928, to make grants towards the publication of text-books in two recognized vernaculars, one for Matabeleland and one for Mashonaland. A Language Research Committee was appointed under the chairmanship of the late Father Barnes, of Penhalonga, and in 1929 Dr. Doke was invited to make recommendations, based on a linguistic survey of Mashonaland, for the adoption of a unified language and a standard orthography. His investigations showed that of the five leading Shona languages, Zezuru, Karanga, Korekore, Manyika, and Ndau, the first four had a very high percentage of common words, while many were common also to Ndau; this fact had been obscured by the diversity of symbols used to represent similar sounds. Dr. Doke recommended¹ the recognition of Ndebele or Zulu for the Ndebele-speaking area, and of Shona for the main Shona-speaking area, but pointed out that the Karanga group in the west of this area has developed a language too different from the others to be included in the unification. For Shona and Karanga he recommended orthographies based on the principles advocated by the International Institute of African Languages and Cultures. These have been adopted by government and the Language Committee prepares publications in them, but their use is not officially pressed, and some missions do not accept them. A newspaper, *The Bantu Mirror*, is produced in English, Shona, Ndebele, and Zulu, by the Argus Company, assisted by a government subsidy, in return for which approximately 1,600 copies are issued free to native schools.

(c) Northern Rhodesia

In the Northern Province the Bemba language predominates, and is perhaps the most widely understood and useful vernacular in the territory. In the Central Provinces the Lamba-Luba-Wisa dialects show common characteristics with the Bemba language. In the East Luangwa Province Chinyanja is widely used by government officials and missions as a lingua franca, and although

¹ *The Unification of the Shona Dialects*, 1931.

it is not a vernacular of the country it has common characteristics with Chewa and the other languages spoken by the local tribes. In the Southern Province the Ila-Tonga dialects predominate; a committee was appointed to consider the unification of these two closely related languages in 1928, and a dictionary of a unified language was compiled by Father Torrend of the Jesuit Mission, but no progress has been made with the work of unification. In the north-western districts the Lunda-Lovale languages are spoken in various dialects. They are akin to and strongly influenced by the Luena language spoken in Angola; these languages are also spoken by the subject and migrant tribes forming a large proportion of the population of the Barotse Province, but the predominant language in that area is Kololo, spoken by the ruling classes and used as an official language. Swahili is spoken by small communities originating from the East Coast in slaving times.

Four languages are recognized for the purpose of the departmental examinations of administrative officers; the government newspaper, first issued in 1936, publishes articles in English, Nyanja, Bemba, Kololo, Ila, and Tonga. The Provincial Commissioners' Conference of May 1934 agreed that it was desirable to reduce the number of official languages, but opinions were divided as to the most suitable *lingua franca*. At present school-books are provided by the missions in most of the more widely spoken dialects, but are only subsidized by government if printed in Bemba, Ila-Tonga, Kololo, now called Lozi, and Nyanja. A committee appointed to consider the standardization of Bemba orthography in 1930 recommended the adoption of the 'Africa' orthography, but it is not generally used in other vernacular literature. The interterritorial conference of education officers from the two Rhodesias and Nyasaland held in 1935 was unable to reach any agreement on a common language policy.

Contact between Africans and Europeans in industrial and farming areas has stimulated a general desire on the part of Africans to learn English and a tendency to view education in the vernacular with suspicion, and some little amount of English is widely spoken. 'Kitchen Kaffir', a bastardized mixture of the vernacular, Dutch, and English, is generally used as a medium of communication with the European overseers or employers. The Government

of Northern Rhodesia has set up an African Literature Committee, membership of which includes government officials, missionaries, and Africans. A small sum has been allocated by the government for the production of needed literature. The committee formulated the policy that all books in the Nyanja language should be published in Nyasaland or with the co-operation of the Nyasaland Education Department. It is considering the production of books in the official vernaculars, and the promotion and distribution of literature through libraries for rural and urban areas.

(d) *Nyasaland*

In Nyasaland the predominant language, Nyanja, has been adopted as an official language by government. Knowledge of it is compulsory for departmental examinations, and it is intended to introduce it into all schools after two years' instruction in the local vernacular. This policy, however, meets with opposition from some missionaries, partly on the ground that Nyanja, as a language of the conquered peoples, is despised by the dominant tribes, and partly owing to the difficulty of revising existing textbooks. The Livingstonia Mission continues to use Tumbuka, and in the area at the north end of Lake Nyasa, Konde, while other missions use Yao; new literature is still published in these languages. Officials receive a bonus for knowledge of Tumbuka or Yao as extra languages. *Man of Africa*, the biography in Nyanja by Samuel Y. Ntara, which won in 1933 the prize offered annually by the International Institute of African Languages and Cultures for an original work in an African language, was published in 1936 by the Dutch Reformed Church Mission at Mkhoma.

(e) *Tanganyika*

In Tanganyika it is the policy of the administration to develop Swahili as a lingua franca. This language is spoken by the people of the coastal belt as a mother tongue, and is used as a second language by large numbers of people elsewhere. In all government schools it is the medium of instruction until replaced by English, which is usually introduced in the fifth year: no other vernacular is taught. In addition, there are government and native administration primary schools where a full six-year course

is conducted entirely in Swahili. In government-assisted mission schools Swahili is the official medium, but in many bush schools instruction is given in the mother tongue, viz. Sukuma, Nyamwezi, Konde, Hehe, Zaramo, Shambala, and dialects of Chaga. In these schools also, Swahili is introduced in the second year. A government newspaper, *Mambo Leo*, and a children's magazine, *Mwanafunzi*, are published in Swahili.

(f) *Kenya*

In Kenya also, Swahili has been used for many years. For Kipsigis-Nandi no agreement has been reached on a standard dialect or orthography, the language having been written differently by different missions. For Kikuyu, a standard orthography was agreed upon by the missions and formally adopted by government in 1933. Later, objections were made, and the orthography was not used, but it is reported that the question of a standardized orthography is again being raised.

(g) *Uganda*

Ganda, a Bantu language originally spoken by the Ganda only, has spread over a large part of the protectorate through its use by missions for educational purposes. In elementary schools the following vernaculars are also taught: Teso, which is a Nilo-Hamitic language; Acoli and its variants, which are Nilotic; Madi, Gwara, and Kakura, which are Sudanic, and Nyoro and Kyiga, which are Bantu. The annual report of the Education Department in 1927 describes the translation of text-books into these languages as an insuperable difficulty, but competent opinion is expressed that simple text-books are slowly being produced in some of them. A standard orthography for Ganda was agreed upon in 1931, but its use does not seem to have become general.

(h) *The position regarding Swahili in East Africa*

The development of Swahili as a lingua franca for the four East African territories is now an accepted policy.¹ Its introduction into the schools has gone farthest in Tanganyika; in Uganda it has met with a good deal of opposition from missionary bodies

¹ See *Colonial Office Memorandum, Africa*, 1110, 1927.

who, to facilitate their work, would have preferred to see the extension of Ganda. They have now agreed that Swahili shall be taught as a subject in appropriate schools outside Buganda and Busoga (Soga being closely allied to Ganda), and that in certain 'mixed language areas', i.e. those in which the vernaculars are not Bantu, it shall be used as the medium of instruction. Opposition to the policy of the development of Swahili as a lingua franca comes from Africans themselves in some parts, particularly in Buganda, as they regard it as an attempt to stop them from learning English, or at least delay them. Something also must be allowed for the fact that Swahili is regarded as a Mohammedan language by the considerable number of Christians who are concerned. Where there is such a multiplicity of languages, however, some official lingua franca must be adopted. Swahili has shown powers of expansion and become the commercial lingua franca which must be acquired in some degree by all Africans who seek employment outside the tribal areas, and in the opinion of many it is at the moment the only suitable official language. Others hold that English should be the official language, but the obvious difficulty in the way of adopting this latter course at the present time is the very small percentage of Africans who are sufficiently educated to speak it with any fluency, and the still smaller number qualified to teach it. The Report of the Joint Parliamentary Committee on East Africa, published in 1931, in recording these opinions, notes that it would appear desirable to encourage a gradual change from Swahili to English.¹

There are two theories of the origin of the Swahili language. Some scholars assert that it was originally the language of one of the tribes occupying a small region on the Lamu coast² of East Africa opposite Zanzibar. Others think that it is not based upon the language of any one tribe, but that it grew up in Arab settlements along the coast as a result of the fusion of many different Bantu languages with Arabic, and that in this way the Arabic element is as much part of the language as the Bantu element. It owed its expansion in the first instance to its adoption by the

¹ *Report of the Joint Committee on Closer Union in East Africa*, 1931, vol. i, p. 45, para. 107.

² D. Westermann, 'Swahili as the Lingua Franca of East Africa', *The Church Overseas*, Jan. 1933, pp. 1-11.

Arab traders who, in the days before European colonization began, had the monopoly of trade and, above all, of the slave trade, from the coast up into the Congo. They were joined by others, such as Persians and Indians, and the descendants of slaves from the interior, who formed the composite people known to-day by the name of Swahili, and their language became the common tongue not only of the trade routes, but of the coastal areas.

Swahili has certain characteristics which account for its capacity for expansion. While it has a large number of words borrowed from the Arabic, these have been so far adopted into general use as to lose their foreign character, and have thus added to its richness and flexibility. On the other hand, it is not in a grammatical sense a mixed language, but is of a pure Bantu type, simple in structure and with great elasticity of expression; it has a further advantage in that it is closely related to most of the languages of East Africa, while it has lost the distinctions of tone which make some of these difficult to master. It has extended throughout East Africa, and into the Congo. It has two important dialects, that of Mombasa (Kimvita) and of Zanzibar (Kiunguja). The former is now confined to the littoral region of Kenya; the latter is the dialect widely dispersed in East Africa, and is spoken by all who have any claim to education from the coast to the great lakes. Farther west, on both sides of the Congo border, this widespread language, changed considerably from its original form, is known as Kingwana.¹ On the East Coast the Arabic script, formerly the accepted script and still important for documents, is still in use, though tending to die out.

An Inter-Territorial Language Committee was set up in 1930; it consists of sixteen members, representing Kenya, Tanganyika, Uganda, and Zanzibar. Its functions are to establish a standard orthography for Swahili, to revise existing text-books, encourage African authors, and control the preparation of dictionaries. It has been accused of trying to force strange words on the African, and it is very commonly criticized for having no African member—a situation which it seems desirable to remedy. There is now a considerable literature in Swahili, and it is claimed that it has

¹ See below, p. 95.

shown itself capable of adaptation to the expression of new processes of thought, and even of providing a terminology for technical uses.¹

(i) *Nigeria*

In Southern Nigeria the languages officially recognized for vernacular education are Yoruba, Ibo, and Efik-Ibibio. Literature exists also in Bini (Edo) and Sobo, and the Education Department will register as 'vernacular teachers' men who speak other vernaculars, such as Ogoni and Soko. Studies have been made of Bini by Dr. Melzian, and of Ibo and Efik, particularly from the point of view of tone structure, by Dr. Ida Ward. The 'Africa' orthography was adopted in 1929 by the local education committees for Yoruba, Ibo, and Efik, and in the same year an Ibo Translation Bureau was formed, which prepared grammars, translations, and school readers, and encouraged the production of works in Ibo by native authors. An Efik Bureau, established in 1930, did similar work in Efik. In the interests of economy these bureaux were first amalgamated and then closed. Work on an Efik dictionary, begun by the Efik Bureau, is still proceeding. Owing partly to the expense of reprinting current literature, the Protestant missions have not yet given effect to the decision, in which they participated, to adopt the 'Africa' orthography; since the Catholic missions as well as the government have done so two scripts are now in current use. In Yoruba, however, the new script has not been used by either government or Roman Catholic missions; the older system uses diacritic marks, which appear in many cases to be disregarded by native teachers. As far as orthography is concerned, however, the major problem of finding a satisfactory script is solved; all that has to be done is to overcome the incidental difficulties of putting the solution into practice. Financial assistance by the government would remove one of the main causes of opposition.

In the Ibo-speaking districts a more serious question, which is still far from solution, is what shall be the form of the literary language. The Protestant missions use 'Union Ibo', the composite language into which the Bible was translated by Archdeacon

¹ D. Westermann, in *The Church Overseas*, Jan. 1933, op. cit., p. 10.

Dennis in 1915. This is said to be based on the dialect of the Owerri region, but speakers of other dialects, including Onitsha, Bonny, and Aro Cuku, helped in the translation. Moreover, in the Owerri area itself, there are many dialectal variations. The verb formations of this area, which differ considerably from those of some other Ibo-speaking districts, have been generally but not consistently used, and the sound systems are apparently not those characteristic of any single dialect. The form of Ibo recommended by Dr. Westermann during his visit to Nigeria in 1929 is a combination of Owerri construction with 'union' vocabulary. This is the basis of the grammar by Mr. R. F. G. Adams, published by the Ibo Translation Bureau. Dr. Ida Ward's investigations have shown the importance of tone and revealed that this varies less from one dialect to another than any other element. The difficulties that result from the prevailing indecision as to language policy have been described by Miss M. M. Green, an anthropologist who made a field study of the Ibo in 1935-7.¹ In her view it is essential to obtain the material for the development of a satisfactory common language by means of a systematic dialect survey carried out by experts. Such a study requires the collection of data sufficient to provide a statistical basis for the union language to be adopted, and it would provide material for the much needed dictionary of this important language, which is spoken by three to four million people.

In Northern Nigeria the principal languages are Hausa, Nupe, Tiv (Munshi), Kanuri, and Fulani, Hausa being used as a lingua franca over a large area. A Hausa dictionary has been compiled by Dr. G. P. Bargery, the Bible has been translated into Hausa, the New Testament into Nupe, Tiv, and Tangale, and parts of it into twenty-eight other languages. An investigation was made in 1932 by Dr. J. Lukas into the Kanuri and neighbouring languages in the Lake Chad area under the auspices of the International Institute of African Languages and Cultures. His *Study of the Kanuri Language* is now published. Work on Fulani, a language which presents problems of scientific and practical interest, has been done by Mr. F. W. Taylor, Mrs. Leith Ross (whose grammar

¹ 'The Present Linguistic Situation in Ibo Country', *Africa*, vol. ix, no. 4, 1936, pp. 508-23.

was published by the Nigerian Government), and several French linguists. There is need for further research on this language. A Translation Bureau at Zaria is responsible for the provision of text-books, and in 1933 inaugurated the publication of volumes of fiction in Hausa by native authors. Mr. R. M. East, who is in charge of this scheme, has pointed out¹ the difficulty of developing a literature of any quality in a language which those who are taught to write it cease to read or write at the age of 12, when their education begins to be conducted in English. Nevertheless, five manuscripts had been published by 1936, each of about fifty pages. The Translation Bureau has also had to deal with the question of the incorporation into the language of foreign words, both those which have been adopted into colloquial usage, and those which are needed to convey ideas for which the vernacular has no equivalent. Earlier practice in Northern Nigeria was to borrow such words from a language believed to be more closely akin to the vernacular than English; thus words lacking in Hausa were supplied from Arabic, and in Tiv from Hausa. This method has now been abandoned, and the alternatives of inventing a vernacular equivalent for a new concept, or using the English word, are used according to circumstances. In Arabic and Fulani, languages of great flexibility, not much difficulty has been found in inventing new vernacular terms. In Hausa, where large numbers of English words are being spontaneously incorporated into the language, terms which have to be borrowed are taken from English, but unassimilated words are used as little as possible. The introduction of English words, incidentally, is likely to limit the use of publications to British territories, since to the Hausa-speaking area in French territories, the English words will not be familiar, a development illustrating the need for co-operation across political frontiers. The question of the spelling of such words also arises; if they are treated as foreign words, and spelt as in English, the consistency which is the essence of a phonetic orthography is ruined. The method now followed as regards Hausa is to spell assimilated words phonetically and write unassimilated words in italics in the English spelling. In other languages foreign words

¹ 'A First Essay in Imaginative African Literature', *Africa*, vol. ix, no. 3, 1936, pp. 350-8.

introduced into text-books are spelt phonetically throughout.¹

In the British Cameroons, Kanuri, Hausa, or Fulani is used in the elementary schools of certain districts, with English at the end of the course and in the middle-school classes. Of the other languages, Duala, Bali, and Bakweri are the chief. Duala, the main centre of which is in French territory, is a vernacular widely used by the Basel mission, who have produced a considerable literature. The numerous less important languages are not likely to develop a literature, and it has been decided to teach English after a short period of learning in the mother tongue. Pidgin English has been established for some time, and it is the policy of government to replace this by simple English based on limited vocabularies.

(j) *The Gold Coast*

In the Gold Coast, including the mandated territory of Togoland, the leading languages are Twi-Fante, Ga, Ewe, and Dagomba (Dagbane). Twi and Fante are closely akin, but have had a separate literature for more than half a century, so that unification is difficult. Mossi is so closely related to Dagomba that the same literature is suitable for speakers of both. In the south-west a dialect of Fante called Nzima is spoken; Africans who use it are endeavouring by their own efforts to establish it as a written language. There are good vernacular literatures in Twi, Ga, and Ewe, mainly produced by German missions. There has been an increase recently of the production of books in Fante, in which language the Bible is now being completed; that of Dagomba literature only began in the last year or two, although the language extends over a wide area. It is, however, making progress, and a valuable study is being made by district officers. The Gospel of St. Matthew and the Acts of the Apostles have been translated, and a Dagomba dictionary, in the compiling of which the missionaries have given assistance, will shortly be published. The government has officially adopted the 'Africa' orthography, and excellent new school-books have appeared in Twi and Fante. The Achimota College press has been active in vernacular printing.

¹ R. M. East, 'Language Tendencies in the Languages of Northern Nigeria', *Africa*, vol. x, no. 1, 1937, pp. 97-105.

(k) Sierra Leone

In Sierra Leone the main languages are Mende, Temne, Limba, Kono-Vai, and Manenka. There is little vernacular literature, what there is being mainly in Mende and Temne. The 'Africa' orthography has been adopted. English is used mainly as a medium of instruction.

(l) Gambia

In the Gambia, Mandinka (a branch of the widespread Mandingo language), and Wolof or Jolof (also spoken in French West Africa) are the main languages. There is little vernacular literature.

(m) The French Territories

The leading language of French West Africa is Mandingo, with three main dialects, Djula, Bambara, and Malinke. Owing to the insistence of the administration on French as the language of instruction¹ little vernacular literature exists apart from devotional books. A collection of texts in the Dyerma language of the Niger valley, with a grammar and vocabulary, made in the 'Africa' orthography, by Colonel Ardant du Picq, was recently published in the official *Bulletin des études scientifiques et historiques*. An obstacle to the use of this orthography is the argument that, as the greater quantity of school literature is French, it is less confusing to the native to represent his language by symbols whose meaning corresponds to that which they have in written French.

In French Equatorial Africa, Sango, 'a Sudanic counterpart of Lingala',² appears to have something of the position of a lingua franca; it has a number of borrowed French words and is being developed by missions as a literary form.

(n) The Belgian Congo

The Belgian Congo recognizes for official purposes four of its 200 native languages, Kongo, Luba, a modified form of the Kingwana dialect of Swahili, and Lingala, the last being also originally a commercial lingua franca based on the vocabulary of Bangi, Lolo, and Ngala.³ Commercial accounts, the keeping

² E. W. Smith, 'Africa: What do we know of it?' *Journal of the Royal Anthropological Institute*, vol. lxxv, 1935, p. 51.

³ Ibid.

of which is obligatory, may be kept in Ruanda, Rundi, Kongo, Swahili, Luba, or Lingala. The standardization of Kongo and Lingala is under discussion. A standard Luba has been adopted by the Catholic missions, and in 1936 the Protestant missions accepted a standard based upon a new *Grammar and Vocabulary* published by the Conseil Protestant du Congo. Attempts by the Protestant missions to produce a standard Kingwana did not meet with much success owing to the diversity between different dialects, but the hope of unifying the two standardized forms which exist ('Lualaba' Kingwana, south of Stanleyville, and 'Ituri' Kingwana north-east of Stanleyville), has not been abandoned, the missionaries working in the northern regions having agreed to seek gradually to improve the poorer form of Kingwana spoken by their people until it reaches the standard of 'Lualaba' Kingwana. Professor E. de Jonghe in 1935¹ proposed the development of Luba as a single language for the whole territory on the ground that Luba is spoken over a wide area and is easily learnt by other tribes, while Lingala and Kongo are spoken only by small groups, and Swahili is a foreign language to the natives of the Congo. This proposal is not accepted by all who are interested in the language problems of the Congo, nor is it agreed that Lingala and Kongo are spoken by small groups only. The present Governor-General, anxious to make progress with the language question and orthography, has called a joint conference of government officials and representatives of the Catholic and Protestant missions.

(o) *The Portuguese Colonies*

Thonga is the most important language of Portuguese East Africa, though several other languages and dialects are used in some areas. Kongo and Umbundu are the main languages of Angola.

The insistence of the administration on the use of Portuguese as the language of school instruction places the vernacular languages in a position corresponding to that in the French territories. Missions are permitted to use vernaculars for religious teaching, but vernacular publications are discouraged or forbidden.

¹ See E. de Jonghe, 'Vers une langue nationale congolaise', *Bulletin de l'Institut Royal Colonial Belge*, vol. vi, 1935, pp. 340-51.

VI. THE INFLUENCE OF EDUCATIONAL POLICY ON LINGUISTIC DEVELOPMENT

Great as is the seeming multiplicity of languages, there is not an equal measure of real diversity: the tendency of closer examination has been to reveal significant and essential similarities not only in the sound system and vocabulary, but even more in structure and idiom. It was therefore to be expected that, with the increase of intercourse following European occupation, there would, in any case, have been a progressive measure of assimilation resulting in the emergence of dominating languages. This process seems to be determined by a variety of circumstances—such, for instance, as the acquisition of a superior value by the speech of a ruling race, or the existence of a degree of kinship to neighbouring tongues which makes for a natural amalgamation, a factor which would seem to account for the spread of Hausa and Swahili or the predominance of one dialect, Malinke, throughout the large Mandingo area.

These spontaneous developments are now subjected to deliberate measures of educational policy. That those measures will have an important effect in moulding the form of the languages concerned is obvious, but it is not yet possible to estimate the extent to which they will determine the survival of different languages or language groups. A language, over and above its value as a means of communication, is an integral part of the individuality of a people, intimately connected with every aspect of its social life, and it derives from this source that 'emotional' quality which makes it resistant to influences from external sources. It was the emotional element which enabled some of the European languages to resist the influence of latinization and to emerge subsequently in a national form, while others, though submitting to the Latin influence, nevertheless reproduced much of their own idiom and vocabulary in the form of language finally evolved. There are, again, many instances in which people who have been politically and economically assimilated have still retained their own speech. Resistance of this type is, however, a varying force; as Meillet has pointed out with regard to the past, 'all the regions whose history is at all ancient have, within historical times, changed their

language at least once, and often two or three times'.¹ Only experience will show the extent to which the African languages, with their absence of a literary tradition, will assert themselves in the face of the influences to which they are being subjected. The effect of the steps taken to substitute a lingua franca or a 'union' language for the local vernacular would seem to demand careful observation, and policy may have to be modified where such languages do not appear to be winning their way by a natural process of assimilation.

Of the value of a policy which encourages the formation of larger language units there can be no doubt, and the benefits are by no means only those of administrative convenience. It is supported also by the need for a reading public wide enough to make commercial publication possible. It is impossible to estimate the minimum economic unit for the production of literature; in some cases 200,000 suffices for a vernacular literature which is produced without subsidy, while in other parts of the continent it is estimated that 500,000 or even 1,000,000 is for Africa, with the low economic status of its peoples, the minimum. Nevertheless, the importance which attaches to a language as part of the life of a people is so great that their intellectual development would be prejudiced by any measure which imposed on them for educational, and ultimately for literary purposes, a language to which they could not readily accommodate themselves. Though for the present vocational and higher education is necessarily given through the medium of a European language,² yet educational policy, at all events in the British territories, assumes the growth of vernacular literature which will minister to the growing intellectual life of the community. It cannot at present be foreseen whether an African or a European language will ultimately become the vehicle of the higher forms of intellectual activity; the experience of Asia would seem to show that there may be a parallel development, in which the European and African language each has its own function, both for literary and other uses. If any general conclusion is possible in a matter where the factors are still so indeterminate, it is that administrations should, in dealing

¹ *Introduction à l'étude comparative des langues indo-européennes*, 5th edition, 1922, p. 11.

² See Chap. XVIII, pp. 1257 ff.

with questions in this field, look on the problem as one demanding not merely linguistic study of the traditional academic type but an examination of all the social considerations involved. Many of the problems arising demand a comprehensive study extending beyond territorial limits, and co-operation between all who are working in a given language area, if a uniform policy is to be achieved in regard to the larger language groups. Finally, stress must be laid on the need for encouragement both with advice and finance of the African writer, and on the advisability of constant consultation with the African himself, on the whole question of the future of the vernacular, of the choice of a literary language, and of the possibility of a vernacular press. He must, in the long run, be the deciding factor.

VII. DEVELOPMENTS IN LINGUISTIC RESEARCH

Linguistic research in Africa has a field of investigation which is particularly important in the case of languages which have evolved no script. The modern elaboration of a technique for accurately distinguishing and reproducing speech-sounds has immensely increased the efficiency of language teaching, and instruction in it is now an essential element in any course of study designed as preparation for a colonial career.¹ It is perhaps relevant to ask here if governments, missions, and traders give their staff the best chance of attaining linguistic efficiency by enabling them to avail themselves to the full of the best language training obtainable at home, by allowing sufficient time at the beginning of their careers in Africa for language study, and by taking language into consideration when their people are moved from one area to another.

In recent years the technique of the study of languages has undergone important developments. Out of phonetics in the narrow sense, the analysis of speech-sounds with a precision that makes it possible to detect the subtlest differences in the utterance of sounds which to the untrained ear may seem identical, there has grown phonology—that is, a study which seeks to trace not distinctions for their own sake, but for that of their linguistic significance. It is these that are relevant when an orthography is

¹ See I. C. Ward, *op. cit.*, Supplement to *Africa*, vol. x, 1937.

devised, for the practical function of an orthography is to indicate significant distinctions to people to whom it is the normal means of communication rather than to convey to the foreign expert an exact rendering of the language transcribed. A phonological study, by taking into account the distinctions which need to be indicated in order to make the meaning clear, can often dispense with the use of new symbols by a re-allocation of those commonly used in printing; the gain in ease of manipulation in an orthography constructed in this way outweighs the lack of uniformity as between different languages in the significance of the symbols used.

The modern conception of the study of linguistics must nowadays enter fields, such as those of psychology and sociology, that lie outside the range of those formerly associated with it. This new attitude involves a concentration of interest on the spoken rather than the written word; speech must be investigated as it functions in action, and meaning must be sought not in abstract ideas but in concrete situations. The sociological approach is important in the study both of grammatical structure and of usage. With regard to the first, the aim of the modern student is best expressed in the phrase quoted by Dr. E. W. Smith from Father Wanger that it is necessary 'to look upon the grammar of an Ntu (Bantu) language from the Ntu point of view instead of pressing it into the frame of Indo-European languages'.¹ The idea that grammatical categories, corresponding to supposed universal categories of thought, can be applied to the analysis of any language should give place to the realization that the varying degrees of attention given to different aspects of the environment in different societies leads to a corresponding variety in the types of distinction which a language will express. From the point of view of structural analysis, study on these lines would be of particular importance in the production of vernacular grammars for the use of native speakers. This policy was advocated by Dr. C. M. Doke in his book *Bantu Linguistic Terminology*, published in 1935.

In the study of meaning, whether for the purpose of translation, of the preparation of text-books, or the standardization of a single language or a union language, satisfactory results depend upon studies of speech in actual use, which keep constantly in mind

¹ E. W. Smith, *op. cit.*, p. 47.

the relation of language to social facts. It has always been clear that words descriptive of social institutions peculiar to some one people cannot be adequately rendered by the mere selection of the nearest possible equivalent in another language, and the proverbs in which most African languages abound are unintelligible without comment that explains the whole context of associations in native life to which they refer. 'Context of situation must be more than linguistic; it must include an analysis of the general conditions under which a language is spoken.'¹ Such an analysis necessitates residence among the speakers of the language and a close study of their social institutions; it cannot be made by the method of asking informants to give an abstract explanation of the 'meaning' of words. The latter is the only method available to students who cannot devote their whole time to research, but its results, though they represent the first step towards mutual intelligibility between speakers of different languages, may sometimes lead to serious misunderstandings, and can never give an account of the language which will be regarded as adequate by modern standards. An instance of such a misunderstanding is the selection by a mission in Kikuyu as the equivalent of the word 'virgin' of the African term for an initiated but unmarried girl; since by local custom such girls are not required to refrain from sexual intercourse, the implications of the term to the African mind were quite other than those intended.

There is a striking difference in the degree of recognition given to the study of linguistics in America and the Continent of Europe on the one hand, and in England on the other. In the United States, Yale University has, in addition to an independent Chair of Linguistics, a Chair of Anthropology and Linguistics, the title of which explicitly recognizes the close connexion between the two studies; its holder, Professor Sapir, is distinguished for his work in both fields. In addition, Professor Boas has been lecturing for many years on linguistics at Columbia, and Dr. Andrade and Dr. Hoyer are both specialists in linguistics at the University of Chicago. It is an index of the increasing interest in this subject that Dr. M. Swadesh of Yale has been appointed Assistant Pro-

¹ B. Malinowski, 'The Problem of Meaning in Primitive Language'. Supplement to *The Meaning of Meaning* by C. K. Ogden and I. A. Richards, 1927.

fessor of Linguistics at the University of Wisconsin, and it is not irrelevant here to state that the *International Journal of American Linguistics* is now in its ninth volume. In Paris a Société de Linguistique was founded as long ago as 1866, and there is now a University Institute of Linguistics; the chair of linguistics is at present held by Professor Vendryès, who has written a standard work on problems of language. In Geneva the successors of the great de Saussure, one of the founders of modern linguistics, are Bailly, Professor of *Linguistique générale*, and Séchehaye, whose chair is that of *Grammaire théorique*. Oslo and Copenhagen also have chairs of general linguistics. In Great Britain there is only one teaching post in this subject—the Lectureship in Linguistics at the School of Oriental Studies, London. The leading work in modern linguistics in England has been the result of the personal interests of scholars in other fields, of whom Dr. A. H. Gardiner, the Egyptologist, and Professor B. Malinowski, whose chair is that of Social Anthropology in London University, are the most distinguished. No university has yet endowed a chair for the subject.

CHAPTER IV

POPULATION RECORDS

I. INTRODUCTION

WHEN empires in the past undertook the systematic enumeration of their subjects the object appears to have been mainly to secure a means of enforcing fiscal or military liabilities; that, certainly, was the intention of the best known census in history, when, in the first year of the Christian era, the Emperor Augustus ordered 'that all the world should be taxed'. Though in some countries the financial or military motive still exists, nevertheless the chief interest attaching in later times to the accurate collection of population records is based on the recognition that they afford an indispensable means of calculating the need and testing the success of the measures which a modern state is called upon to undertake in discharge of its social responsibilities. A complete application of modern methods involves the collection of data in three ways—by census enumeration, by the registration of prescribed vital facts, and by the maintenance of records of migration. A census should give information not only of the strength, but of the age, sex, and marital status of the population, with occupation and other items of fact; and if it is complete and reliable, its repetition at regular periods will suffice to indicate the increase or decrease of the population, and the rate of its movement. But between two censuses, changes in the numbers, age, sex, and possibly local distribution of the population will have occurred, and as the authorities should know with some approach to accuracy the numbers and composition of their populations year by year, the infrequent periodic enumeration needs to be supplemented by a regular recording system which is constantly in use. This need is met by the establishment of a system of vital registration under which births and deaths are recorded in conjunction with certain prescribed facts, as soon as possible after these events occur. This, however, will not explain fully all the changes between the two dates if there has been

movement in and out of the area, and a record of migration becomes necessary in addition.¹

A peculiar significance attaches to the collection of vital statistics in Africa.² Administrative questions of first importance, such as the regulation of the recruitment of labour,³ or the allocation of land for non-native occupation or native reserves,⁴ cannot be satisfactorily dealt with in the absence of correct information of the present strength of the population and of its probable future trend. Accurate vital statistics supply the information on which the efficacy of the medical organization depends, and, in particular, where such work has to be carried out with limited funds, it is essential to know where the need is most urgent; efficient planning for education depends upon knowledge of the number of children of school age; again, it is only by means of accurate population records that it is possible to settle many questions on which, at present, arbitrary assumptions are made, as, for instance, the effect on the birth-rate of native customs such as polygamy, or abstention from intercourse during a prolonged period of suckling.

II. ESTIMATES OF POPULATION

It was inevitable that in the circumstances of Africa, early estimates of the strength of the population should have been little more than guesses based on insufficient and unreliable data. For the continent as a whole, estimates of 150,000,000 or more appeared in the eighteenth century; the evidence of explorers as to the relative emptiness of the countries they traversed resulted in a reduction of this figure to a range between 28,000,000 and 41,000,000 in the years between 1851 and 1868; the publication of Stanley's reports led to the adoption of figures up to 180,000,000 or more, that accepted in 1882 being as high as 205,000,000.⁵ Estimates made at various times since 1903 have varied between 126,000,000 and 149,000,000.

Calculations made in different African territories have shown

¹ A. M. Carr-Saunders, *World Population*, 1936, p. 2; P. Granville Edge, *Vital Records in the Tropics*, 1932, pp. 13 ff.

² Cf. W. M. Macmillan, *Complex South Africa*, 1930, pp. 35, 36.

³ See Chap. XI, p. 658.

⁴ See Chap. XII, pp. 803 ff.

⁵ *Encyclopaedia Britannica*, 11th ed., vol. xxii, p. 92.

similar wide variations. Soon after the British occupation the population of Northern Nigeria was put at 20,000,000; by successive reductions it was brought down in 1906 to 7,000,000;¹ the census of 1931, however, returned nearly 11,500,000. The population of Kenya was estimated at 4,000,000 up to 1916, but a rough count in 1917 put it at 2,848,700.

At one time, the population of the Congo was guessed at about 40,000,000;² shortly before 1910 it was taken to be 15,500,000; in 1933, however, the administration accepted 9,272,558, including both enumerated persons and an estimate of others; and in 1935 the figure of both enumerated and others was stated to be 11,000,000. In the past, writers on the Congo agreed in accepting depopulation as an acknowledged fact; the Permanent Committee of the National Colonial Congress in Belgium believed in 1924 that there was a danger that the native population might 'collapse or disappear'.³ Some found the explanation in the economic policy pursued by the Free State; others viewed it as due to the introduction of diseases by Europeans and the spread of indigenous diseases through improvements in communication;⁴ others, again, as due to the general influence of European occupation—'la pénétration européenne, telle quelle, par elle-même'.⁵ The fact that population has diminished in certain parts of the Congo has been accepted by Belgian administrative authorities, and, as is shown elsewhere,⁶ has had its influence in producing that intensive study of health and labour questions which has distinguished Congo policy in recent years. It may be doubted, however, if the statistical material available is yet sufficient to enable an accurate estimate to be made of the character, or to determine the causes of the movement of population since the beginning of European occupation.

Estimates regarding French Equatorial Africa have also shown significant variations. About 1900 the accepted estimate of the population was 12,000,000 to 15,000,000;⁷ in 1910, while the

maximum estimate was retained at 15,000,000, a minimum of 5,000,000 was also quoted;¹ an enumeration made in 1911 showed a total of 4,250,000. The enumeration of 1926 gave a total of 3,124,173.² The striking disparity between the estimates of 1900 and the result of more recent enumerations was freely used by some French critics to support their attacks on the colonial system; the cause was found by some authors in the exactions of the concessionnaires and the hardships of portage,³ others claimed that conscription and taxation had led to wholesale migration into British territories. While it may be agreed that the abuses inherent in the concession system must have had some effect on population movement both in the French and the Belgian Congo, it is not possible to claim accuracy for deductions based on a comparison between the earlier estimates and the later enumerations. The extent of the alleged emigration, sometimes put as high as 2,000,000 to 3,000,000, is not supported by the census figures of the neighbouring British territories;⁴ and it must also be realized that the concession system was in full operation only between the years 1901 and 1912, and that the levies made for forced labour⁵ have been relatively lower in French Equatorial Africa than in many other areas. That the population has rapidly decreased in the present century has, however, been accepted in authoritative quarters,⁶ though, as in the Congo, sufficient material does not exist to determine either the extent or the causes of the decline.

The Belgian Congo and French Equatorial Africa have been mentioned as cases which illustrate the unreliability of deductions based on incomplete statistical information; there are others, though they are of less striking character. For instance, the South African attitude to native problems has to some extent been influenced by the forecast made by the Director of the Union Census in 1921⁷ that, after the next fifty years, there would be a population of 6,500,000 Europeans faced by 16,500,000 non-

Europeans, an anticipation which the census figures of 1936 have done little to justify,¹ as will be seen from the figures subsequently quoted.

A detailed study of the population statistics of Africa has been undertaken by Dr. R. R. Kuczynski, as part of the inquiries originating in the present Survey, and will be subsequently published. He estimates that the total population of the continent, shown in the *Statistical Year Book of the League of Nations* for December 31, 1934, as 145,054,000, may be as low as 138,100,000 or as high as 163,300,000; and though the margin of error is large, it is not greater than that for Asia or South America. The relevant figures regarding the population of the countries included in the areas with which this Survey deals are given in Table I.

It might be assumed that the uncertainty of African data would be less so far as the white population is concerned, but while the measure of variation is greatly reduced, there is still some lack of precision. The most recent official enumerations give the total for the continent as 4,014,424, but this cannot be taken as an accurate statement of persons of pure European stock; the returns from some territories are rough estimates only, while varying interpretations are placed on the term 'white'. In the Union, Europeans or white persons are not defined, save by exclusion from the other three classes, Asiatics, 'coloured', and native, the last-named being defined as a 'person, both of whose parents belong or belonged to an aboriginal race or tribe of Africa, and includes any person of mixed race living as a member of any native community, tribe, kraal, or location';² thus the line between Europeans and Asiatics or natives is clear, but it is less definitely marked between Europeans and 'coloured', and the classification must in some cases clearly depend on the discretion of the enumerator. In the French colonies the distinction is between 'Europeans and those assimilated to Europeans' and natives; but the former category is not uniformly interpreted in practice, the 'assimilated' being at times confined to Europeans, and at others including non-Europeans with French citizenship. It is indeed evident that in countries inhabited by different races,

precise classification must always present difficulties, and the interpretation of racial distinctions will vary according to the emphasis placed on them by political or social theories prevalent from time to time. The problems likely to arise may be illustrated by a comparison of the figures of Europeans and 'coloured' shown in the last three censuses of the Union. The Europeans increased between 1911 and 1921 by 19 per cent., and between 1921 and 1936 by 32 per cent., while the 'coloured' increased in the former period by 4 per cent., and in the latter by 41 per cent. It is probably safe to offer as an explanation of these exceptional variations that the proportion of 'coloured' who were enumerated as whites was smaller in 1936 than in 1921, but it is not unlikely that a number of full-blooded natives have been included in the 'coloured' group. Not only does the census classification present difficulty, but it is uncertain what proportion of persons of mixed ancestry and their descendants have passed into the white group, though studies on the subject would seem to show that this is not negligible.¹ The figures of European population in the territories dealt with by this Survey, as given by the official enumerations, are shown in the accompanying statement.

III. METHODS OF ENUMERATION AND REGISTRATION

Some indication of the value attaching to the population records now available may be gathered from an examination of the methods adopted both in regard to census enumeration and the

¹ See G. Findlay, *Miscegenation*, 1936, pp. 43, 44.

registration of vital statistics in the various territories dealt with in this Survey.

In the Cape, the Dutch, as far back as the seventeenth century, took a yearly census, and the British adopted the practice for several decades; regulations provided also for the registration of marriages, births, and deaths. One of the objects of the Colonial Year Books inaugurated in 1827 was to provide information on population trends in the colonies; and reports on population statistics were sent to the British Government in 1806 and in 1849. Later, this interest declined, and the census was taken at irregular periods, often in an incomplete form. Thus, the Cape had censuses in 1865 and 1875, but another was not taken until 1891; for Natal there are more or less reliable records of the white population from 1840 onwards, but the first complete census was taken in 1891; in the Free State the earliest enumeration of the white population of any value was in 1855, and the first census in 1880; while in the Transvaal an incomplete record was made in 1876, and a general, though unreliable, census taken in 1890.¹ The first simultaneous census of all provinces was taken in 1904; subsequent censuses for the Union were made in 1911 and 1921. The South Africa Act provided for a quinquennial census of the European population as a basis for the constitution of the House of Assembly; an amending Act, no. 5 of 1935, altered the census period to ten years after 1941. The Electoral Quota Act of 1937, however, extended the period for the taking of a quinquennial census to the year 1951, after which decennial enumerations are to be made. Censuses of the non-European population are not legally imperative, and in 1931, when a complete census was due, the government felt compelled by financial stringency to restrict the enumeration to that of Europeans as stipulated in the South Africa Act. A census of all races was taken on May 5, 1936, and the preliminary results are now available. The High Commission Territories were included in the censuses for 1911, 1921, and 1936; Basutoland also in that of 1904. As regards the registration of births and deaths, a different series of laws was in force in each of the provinces up to 1923; in that year, the laws

¹ A. Roberts, 'A Statistical Inquiry into the Population Problem in South Africa', *Transactions of the Royal Society of South Africa*, vol. xiii, 1926, pp. 201 ff.

were consolidated in the Births, Deaths, and Marriages Registration Act, which made registration compulsory for all races in urban areas, and for Europeans, Asiatics, and coloured in rural areas; in rural areas, registration by natives is voluntary. The law in certain provinces had previously provided for the compulsory registration of natives in these areas, but this could clearly have been merely a nominal requirement in the absence of any machinery for its enforcement. Even in the urban areas the registration of vital events is still of doubtful value in the case of natives; the urban population, except in three or four towns, includes a large proportion of temporary residents, and there is frequently a great predominance of the male sex; the number of births is therefore small in relation to the population on which the rates would be computed, and these factors would also influence the infantile mortality and general death-rates.¹

The statistics obtained by census enumerations in South Africa, which are supplemented by annual records of migration, can claim accuracy as regards Europeans, subject to the doubt arising from the inclusion of a proportion of 'coloured' in the earlier censuses. They show an increase from 1,116,806 in 1904 to 1,519,488 in 1921, 1,828,175 in 1931, and 2,003,512 in 1936. It is not, however, possible to draw reliable conclusions as to the exact movement of the native population. The census of 1904 yielded a total of 3,491,056, that of 1921 a total of 4,697,813, and that of 1936, 6,597,241. There seems, however, to be doubt as to the value of the enumeration of 1921; and it must be realized that in undeveloped areas the difficulties of enumeration are very considerable: bad weather and absence of easy communications undoubtedly affected the figures obtained in 1911 and 1921. More favourable conditions in 1936 are thought to account to a great extent for the large increase in the numbers obtained. The incomplete character of the registration of vital statistics regarding natives in urban areas and their virtual absence in rural areas make it difficult to check the assumptions which are made regarding fertility and infantile mortality, and the Native Economic Commission of 1932 emphasized the unreliable nature of the data on which common beliefs as to infantile mortality were based.²

¹ *Official Year Book of the Union of South Africa*, 1934-5, p. 957. ² See below, p. 128.

The Department of Health is urging the extension of compulsory registration to rural areas, and an inter-departmental committee has supported this proposal. It was recently discussed by the Statistical Council of the Union, which expressed the view that in introducing a system of registration the greatest care should be taken not to create suspicion in the minds of the natives; it recommended that, as a beginning, registration might be restricted to a limited area. In any case it cannot be put into effect until 1939 at the earliest.

In South-West Africa the inhabitants of the native reserves are required to report births and deaths, but the figures obtained appear to be of little value.

In Southern Rhodesia censuses were taken in 1901 (this was described as 'informal'), 1904, 1907, 1911, 1921, 1926, 1931, and 1936, the last being held simultaneously with the Union census. Although these censuses do not purport to be confined to Europeans, no complete enumeration of the native population has been attempted. The numbers returned are estimates by the native commissioners, based on the number of registered taxpayers, that is, males over the apparent age of 14, and the estimated total is reached by multiplying this number by a selected figure; multiplication by $3\frac{1}{2}$ to 4 is mentioned as one method employed.¹ Such estimates, wherever they are used, are usually found to have a large percentage of errors, for the most part on the high side. Vital statistics are stated to be unobtainable. Employers of natives were asked at the 1931 census to make returns of the numbers in their service, with the country of origin and nature of the work performed.

In Northern Rhodesia censuses have been taken in 1911, 1921, and 1931. In 1931, the European, Asiatic, and coloured populations were actually counted, but the native population was estimated only, figures being obtained by methods similar to those used in Southern Rhodesia. Registration of vital events has been introduced in 411 villages with 43,000 inhabitants, being about 3 per cent. of the population, but it is not systematically carried out.

In Nyasaland the first census was held in 1911. Non-natives

¹ *Official Year Book of Southern Rhodesia, 1926-30, p. 568.*

were enumerated, while the native population was estimated on the basis of the number of hut taxes paid, at 2·8 per hut, this figure being reached by a count made in selected villages. A new system was introduced in 1921, and followed in the two subsequent censuses of 1926 and 1931. The method adopted, based on that employed in India, was to subdivide each administrative district into enumeration areas, each in charge of a native enumerator, specially instructed in his duties. In the three weeks preceding the census each enumerator visited every village and made a count of all natives permanently domiciled there, whether or not they were actually in residence on the census day. This method—the so-called *de jure* method¹—has considerable value in that it enables the enumerator to make inquiries into details which would be impossible on the day of enumeration. In many cases the native enumerators were the same in the three censuses of 1921, 1926, and 1931, and the forms were the same with the exception that, in 1931, an attempt was made for the first time to obtain statistics of literacy. It is possible to claim for the Nyasaland census a more comprehensive scope and greater accuracy than that of a number of other territories. The report on the census also contained much useful information on the tribal groupings.² Registration of vital events has been instituted experimentally in the Fort Manning district with 35,000 inhabitants (2 per cent. of the total population), and an intensive survey has been carried out in the same area.³ A study of the distribution of population in Nyasaland, made in 1928 by Mr. F. Dixey, has reference mainly to the influence of water supply on population problems.⁴

In Tanganyika censuses were taken by the German administration in 1913 (giving a total for natives of 4,063,300), and by the British in 1921, when the total for natives was 4,107,000. It is considered that these figures are not sufficiently accurate to point to any conclusions with regard to the movement of population; the census for 1931, which gave a total for natives of 5,022,640, is regarded as appreciably superior in accuracy. The responsi-

¹ P. Granville Edge, *op. cit.*, 1932, p. 19.

² *Nyasaland Protectorate Census Report*, 1931, pp. 15–24.

³ P. Granville Edge, 'The Demography of British Colonial Possessions', *Journal of the Royal Statistical Society*, 1937.

⁴ *The Geographical Review*, 1928, pp. 274–90.

bility was left largely with the native authorities, who had already made a count of the population under their control in 1928, which is held to have been reasonably accurate. The method devised in 1931 for checking the enumeration was to carry out a count under the supervision of district officers in a number of villages selected as typical; the general agreement of the independently compiled rolls of taxpayers with the figures obtained in the population count is held to corroborate the general accuracy of the latter. An exception is admitted in the case of the Tabora District, where, the figures being suspected, a test check was made which showed that they were 'entirely inaccurate'. The official estimate of the native population in 1934 was 4,950,505, a decrease on the census figures for 1931; the estimate for 1935 raises the total once more to 5,096,178; the fluctuations probably represent errors in the estimates rather than changes in the number of people in the territory. The various tribes have been classified in groups according to the proportion of children to adults. The assumption is made that a high proportion is a sign of satisfactory conditions; the value of the assumption based on the proportion of children to adults is, however, open to some doubt. Some tribes dislike giving the number of their children, and a count in their case is of doubtful accuracy; also it is possible that a high proportion of children to adults is more likely to be evidence of a high mortality among children, than of a comparatively low infantile mortality, since the greater the proportion of children born who do not reach maturity the greater must be the ratio of children to adults. The registration of births and deaths is compulsory only for Europeans; it is optional for other non-native persons and for natives. The figures derived from registration are said to be of little statistical value and are not given in the annual Blue Book.

An intensive medical inquiry carried out over a period of four years under Dr. A. R. Lester in the Kahama District produced for that area valuable figures as to vital statistics; had examination been compulsory, as it is in the Belgian Congo, the figures would have been even more complete. A difficulty peculiar to local circumstances is the high degree to which the figures are affected by migration, which makes it impossible to draw conclusions as

to long-term trends from an inquiry extending over so short a period. A study of population distribution in relation to environmental factors was made in 1934 by Mr. C. Gillman.¹ His study showed that two-thirds of the total population are concentrated in one-tenth of the area where permanent water is available for domestic purposes, while 62 per cent. of the total area is uninhabited, largely through the absence of water. This leads the author to the conclusion that a redistribution of population is necessary in order to check the process of erosion in the densely inhabited areas, and that this must be accompanied by measures for water conservation and the tapping of underground sources.² A similar map, compiled for the whole of East Africa, has been prepared by Mr. S. J. K. Baker.³ He concludes that East Africa as a whole 'has not yet attained its maximum, nor even its optimum, population and that the present population is insufficient to make the fullest use of the natural resources at its disposal'. On the other hand, at its present stage of technical knowledge, the native population as a whole is living near the margin of subsistence, and in the over-stocked areas the density is, 'in relation to the economy of the tribal group, far above its optimum level'.

In Kenya, no complete census of the native population has been made. At the time of the non-native census of 1931, a count was made of all persons in the towns of Nairobi and Mombasa, while owners of premises and farms were asked to make returns of natives resident upon them. A total of 70,448 natives was enumerated out of an estimated population of 2,966,993. Annual estimates of the population are made by the Chief Native Commissioner on the basis of counts of huts and polls made by native counters. In a study⁴ made of the system by Mr. S. H. Fazan in 1935, it is stated that the count of married women is generally accurate, as every such woman has her own hut; old women, however, who have been exempted from taxation, are sometimes omitted: the count of men is less accurate owing to their constant movement to and from centres of employment. Owing to considerable variations in the estimates for children, district officers have

¹ 'A Population Map of Tanganyika Territory', *The Geographical Review*, vol. xxvi, 1936, pp. 353-75.

⁴ Unpublished.

instructions to show them as 37 per cent. of the population, unless they have special reasons for submitting estimates of their own. This procedure would seem to rule out the possibility that these counts can give a close indication of the trend of population, but the reasonably accurate figures of married women, supplemented by special inquiries in selected areas, form some guide for checking the other figures. Mr. Fazan considers that, although the margin of error has been about 8 per cent., errors occur more often in the addition of numbers than in counting, and these can now be more easily checked by means of forms on which the count is entered. Rough calculations of the trend of population in the principal tribes were made for the use of the Land Commission in 1930; it drew from them the conclusion that the native population as a whole is increasing rapidly and will continue to do so during the next two decades.¹ It has been calculated, by comparing the estimates for 1925 and 1931, that the population between those years was increasing at the rate of 3 per cent. per annum. This is almost certainly too high a figure. The medical survey of the Digo District, conducted under Dr. C. R. Phillips in 1932, gave interesting vital figures, which, however, relate to too small a period to be of real value. There is no system in force for the registration of vital statistics, even for the non-native population.

Although the organization of a simultaneous complete census in Kenya, Uganda, and Tanganyika had been discussed at the Governors' Conference in 1929, only Uganda in 1931 made a native census on the lines which had been proposed. Here, censuses had previously been taken in 1911 and 1921. For that of 1931 a schedule was drawn up for the use of native enumerators, based on group units, which were to be as small as possible, and a variety of detailed information was asked for; thus five age-classes were introduced, namely, under 1 year, 7 years, 7-18 years, poll-tax payers, and aged persons. It would seem, however, that the demand for these details placed too great a strain on the resources of the native enumerators, and the returns contained many inaccuracies. It had been hoped that the results would make possible the plotting of the first native age-frequency curve in Africa; despite

¹ *Report*, Cmd. 4556, 1934, para. 1370.

the relatively low standard of accuracy in the returns, it is believed that an approximate calculation could be based upon them, if a statistician could be detailed for the work. In the meantime, however, the published statistics of the native population are limited to classification by sex, civil condition, religion, tribe. In Uganda, registration of births and deaths was introduced in 1926 for the whole protectorate except Karamoja; a more complete vital statistics form was introduced in 1930; it is not compulsory, and is carried out through the agency of chiefs. The careful analysis made in the Annual Medical Report for Uganda of 1932 shows that the vital statistics, though not without value, can be relied on only within certain recognized limits. The results are, in particular, liable to be vitiated by the fact that no satisfactory records are maintained of migrations.

For the non-native census in Kenya, Uganda, and Tanganyika a uniform scheme was drawn up by the statistician to the Governors' Conference, but was not adhered to in every detail by all the three territories. The heads of enumeration adopted by all three showed age, sex, conjugal condition, nationality or race, birth-place, religion, education of juniors, and occupation. Kenya and Uganda had a special entry for 'relationship to head of family'. In Kenya the place of permanent residence and years of residence were recorded. In Tanganyika the greater part of this information was asked for for the first time, the heads of race, civil condition, birth-place, age, religion, and education all being new. In all these territories the non-native population is classified into European, Indian, Arab, and Goan; Kenya and Tanganyika have a further classification for half-castes; Uganda includes these either under natives or 'other unclassified non-natives'. In Nyasaland non-natives are classified only into European and Asiatic.

In Nigeria recent census inquiries have been more detailed than in many other African territories; Lagos has had a decennial census since 1871; the first census taken for the whole country was in 1911, but this appears to have been of the character of a rough estimate. Ten years later there was a genuine census, accompanied by an inquiry which provided a mass of information on the history, ethnography, and anthropology of Nigeria, published

in a report of six volumes.¹ In 1931 a complete enumeration was not made, owing to the troubled political situation in the Southern Provinces. In the Northern Provinces a general census was taken, while a special 'intensive census' was also made of a number of villages. The result was to obtain 'data relating to 407,390 persons in 200 villages, unquestionably more accurate than any previous population data from Nigeria'.² In the township of Lagos a full enumeration was made.

The Government Statistician divided the results of the 1931 census into four classes as follows: the intensive census data with an error of not more than 2 per cent.; the Northern Provinces general census data with an error of not more than 5 per cent.; the data from Lagos Township with a calculated error of 10 per cent. and of the greater part of the colony and Southern Provinces with a probable error of 10 per cent.; and, finally, the data from the provinces of Onitsha, Owerri, and Calabar, where the error may be 15 per cent. to 20 per cent. Particulars of age, sex, occupation, and religion were recorded for the whole of Nigeria; the census report also gives statistics of the adherents of various religious denominations, schools, numbers of live stock, cultivated and uncultivated land, and the area and yield of different crops. In connexion with the general census, special medical censuses were taken, one in the Northern and one in the Southern Provinces. In the former 9,491 persons were examined in four villages; the second covered 11,023 persons; these recorded persons suffering from epidemic and infectious diseases, and bodily affections and infirmities. Registration of births and deaths is carried out in Lagos (where the system commenced in 1867) and in the townships of Calabar, Kano, and Port Harcourt, comprising in all about 1 per cent. of the population; but the accuracy of the system has been questioned.

In the Gold Coast decennial censuses have been held since 1891; the first two, however, did not extend beyond the colony. The original method used was to direct heads of families to drop into a calabash a grain of Indian corn for every male member

¹ P. A. Talbot, *The Peoples of Southern Nigeria* (4 vols.), 1926, and C. K. Meek, *The Northern Tribes of Nigeria* (2 vols.), 1925.

² *Census of Nigeria*, 1931, vol. i, 1933, p. 3.

and a cowrie or palm-kernel for every female. This remained in force in some areas up to 1921, but in 1931 educated enumerators were employed throughout the territory, an enumeration of houses being made some months in advance, mainly through the agency of the native authorities. The results of the census have been analysed in a valuable book by Mr. A. W. Cardinall.¹ They show in nearly all districts a striking increase of population, which has been attributed to immigration attracted by economic developments and possibly impelled by the progressive desiccation of the Sahara. Registration of births and deaths, which is in force in thirty-four towns, covers a larger proportion of the population than in most other areas—nearly 8 per cent.—and it is noteworthy that the system requires the production of a death certificate or post mortem in the case of death. A study of the figures of some areas, however, reveals birth and death rates so low as to suggest that registration in them is not systematic. Registration of births and deaths has been extended to the town of Ho in British Togoland.

In the colony of Sierra Leone the census of 1931 was the sixth regular decennial census; in the protectorate this was the fourth decennial census. At the previous censuses the figures for the native population were arrived at by estimates; in 1931 administrative officials were asked to carry out as much actual enumeration as possible as a basis for estimates of the total. During a period of three to six months a number of villages was counted in detail by the commissioners; from these counts the number of persons per house was ascertained and used as the basis for calculating the population of the rest of the territory from house tax lists. Information bearing on the 'social and moral well-being of the population' was sought by the circulation of a questionnaire to medical officers, relating to such matters as the fertility of women, the effect of the age of marriage, of excessive intercourse and polygamy, the causes of infant mortality, and the adequacy of the normal native diet. None of these questions, however, can be answered without ample objective data; opinions, particularly on such matters as the effects of unfamiliar sexual customs, are of little value unless supported by facts, and doubly doubtful if they are offered in explanation of phenomena whose existence is

¹ *The Gold Coast*, 1931, pp. 148ff.

itself merely assumed. A detailed study of questions of this type, extending over a comparatively small area, would certainly have had more scientific value than impressions recorded in reply to general questions of the nature of those indicated. A system of registration of births and deaths is in force throughout the colony area, comprising 100,000 inhabitants, or 6 per cent. of the total population; it is stated to be complete in Freetown, with 60,000 inhabitants, but is of doubtful value elsewhere. In the protectorate there is a system of permissive registration. Decennial censuses have been taken in the Gambia since 1881; registration is in force in Bathurst, with 14,000 inhabitants, forming 7 per cent. of the total population. The registration of deaths is reported to be complete, but that of births inadequate.

In the Belgian Congo demographic questions have attracted much attention owing to the anxiety felt regarding the decline of the population, a matter to which reference has been made on page 105. No regular census has, however, yet been taken, the administration relying for its population statistics mainly on the system of *recensement sur fiches individuelles*. This method contemplates the maintenance of a complete card index register at the head-quarters of each administrative division or *territoire*, compiled as the result of annual visits of the *agents territoriaux*¹ to each native *circonscription*; it involves transfer from one division to another of the *fiches* of those who are found to have changed their residence. It is compulsory for every adult of either sex to present himself for registration and obtain a *livret d'identité*. This system, if extended to the whole territory, and systematically operated, would have great statistical value; but in practice it has not yet been found possible to cover the whole territory nor to maintain the records with the requisite regularity, though the system is being gradually extended and in 1935 the claim was made that it now covers 91 per cent. of the population. In some hundred *circonscriptions* a rough register is kept by clerks of native courts or other educated natives; in some *chefferies*, particularly in the Lower Congo, native authorities have been able to institute card registers. It is recognized by the administration that the results cannot be said as yet to afford a complete record of the population; indeed,

¹ See Chap. VI, p. 244.

M. Ryckmans¹ has observed that 'le résultat est que pour avoir voulu posséder un recensement parfait, nous n'avons même pas un dénombrement approximatif'. Recently, therefore, the administration has adopted a different approach to the study of population movements. Sample centres, as far as possible typical of a large area, are chosen where counts are made each year; by 1935 studies of this kind covered one-sixteenth of the estimated total population. From these detailed studies a coefficient is calculated for each region to four decimals, and the estimated population for the whole region is obtained by multiplying the number of tax-payers by this figure.

In the course of their visits of inspection, made every six months, the medical units engaged in the prevention of sleeping sickness examine the whole population of the villages treated, who are obliged to present themselves for examination, and names, sex, age, and profession are recorded on cards, in addition to medical details. Unfortunately, from the point of view of comparability with the administrative figures, the groups dealt with are apt to overlap political boundaries; in any case these figures refer to non-typical groups. Since 1931, however, they have been supplemented by the work of the great organization for intensive medical work, the Queen Elizabeth Fund (Foréami), whose general medical work in the Lower Congo covers a total population of 350,000. The large medical staff maintains a vital record of the population sufficient to allow comparison of one year with another.² Another source of demographic statistics is the register of baptisms, marriages, and burials kept by the Christian missions. These cover what is at present a non-typical section of the population; nevertheless, for this section, whose relative importance will almost certainly grow, the statistics give interesting information on such questions as the age of marriage, longevity, and infant mortality. The regular process of registration of births and deaths applies to all Europeans³; natives have the right of *immatriculation* under the law of *État Civil*, and in that case the law regarding births and deaths applies to them; in 1935 there were 4,520 entries

¹ *Démographie congolaise*, *Africa*, vol. vi, no. 3, 1933, p. 245.

² Cf. Dr. G. Trolli and Dr. Dupuy, *Contribution à l'étude de la démographie des Bakongo au Congo belge, 1933, 1934*.

³ *Codes et lois du Congo belge, 1934*, pp. 524-6.

of births, deaths, and marriages; the range of this process is, therefore, small.

In the mandated territory of Ruanda Urundi the original estimate of a total population of 5,000,000 has, as the result of a number of sample surveys, been restated as 3,387,180 in 1935. A special inquiry into infant mortality statistics made in 1934 showed that the maximum infant mortality rate of the most primitive regions—about 10 per cent.—compares favourably with many tropical territories. In Ruanda, by 1935, out of an estimated native population of 1,685,283, a total number of 1,279,096 had been individually registered by the medical census. In Urundi this had covered 219,856 persons out of an estimated total of 1,700,300.

In the earlier history of the French colonies questions relating to the strength of the population attracted much interest. A perusal of the *Annales maritimes et coloniales*, and the monumental work *Notices statistiques sur les colonies françaises* (1837-40) with their sequel, the *États de population* from 1838 onwards, shows that these efforts, while not fulfilling all the expectations formed of them, nevertheless provided the government with considerable demographic information. With the expansion of the territory occupied, interest lessened, and to-day the French African colonies are inadequately equipped with population records. In the present century enumerations have been made at five-year periods, but though the figures relating to French citizens may be taken as correct, accuracy is not claimed for enumeration of the rest of the population. It has been admitted that the figures are the result of *évaluations assez imparfaites*.¹ The five-yearly enumerations are based mainly on the tax registers, prepared for the most part on information supplied by chiefs; the figures of non-taxpayers are estimates only, and there is no information regarding age-classes and the like. M. Brévié, the late Governor-General of French West Africa, has called attention to the lack of adequate population figures; he remarks that in their absence 'les mesures d'ordre administratif et social manquent d'assise, et on calcule mal les incidences. Ce n'est que par une statistique, judicieusement et régulièrement tenue à jour, que l'on peut connaître

¹ *Annuaire statistique de l'Afrique occidentale française*, 1933-4, p. 19.

l'économie d'une Colonie, je dirai même sa psychologie profonde'.¹ He indicated in 1933 that a number of officers would be added to the 'local' civil service as *agents recenseurs*, who would complete the work in each colony in five or six years, and thereafter supervise the operation of the system; but the establishment so far provided appears hardly adequate for the maintenance of a method such as that contemplated. In French West Africa the registration of vital events is regulated by an *arrêté* of May 29, 1933 (amended in 1934). A centre for registration exists at the headquarters of those administrative subdivisions where natives are able to register if they wish. Registration is, however, compulsory for certain classes of natives, such as the inhabitants of municipalities, members of the fighting services, government officials, holders of trading licences, and native chiefs. No similar steps have been taken in French Equatorial Africa, where population figures appear even less reliable than in French West Africa. The French law makes registration of births and deaths compulsory for French citizens, that is about 2 per cent. of the total population. In Togoland sample surveys have been made annually for some years by medical officers, and it is probable that these give more accurate figures than the general census. Voluntary registration, similar to that in force in French West Africa, and a system of compulsory registration in the large urban centres were introduced under the *arrêtés* of November 17, 1921, and November 20, 1923, but have little statistical value. In the French Cameroons the results obtained by the five-year census, conducted on a system similar to that of French West Africa, have been subject to considerable variations. That of 1924, giving a total of 2,771,132, was said to be subject to the suspicion that chiefs had a general tendency to conceal names of taxable persons 'for the sake of a clandestine profit', and the results were held to represent a possible inaccuracy of 10 to 20 per cent. for certain regions recently occupied. A census subsequently taken in 1926, however, showed the native population to be only 1,877,113, and the administration then declared prior figures to have been wrong. The next census of 1931, which was in itself said to be incomplete, showed a total of 2,223,802, and it is difficult to decide between

¹ *Discours à l'ouverture de la session du Conseil de Gouvernement*, 1933, p. 52.

the merits of the three enumerations. In one district at least a card index system, somewhat on the Belgian model, has been attempted. Voluntary registration of native births, deaths, and marriages was introduced by an *arrêté* of June 30, 1917, and this was replaced by an *arrêté* of July 15, 1930, in turn repealed by that of March 15, 1935, which made registration compulsory in certain areas. There are fourteen centres in which the voluntary system of 1917 is still in force; they recorded in 1935 only 381 events; in the 309 centres brought under the 1930 procedure, 143,720 events were recorded. The registration is carried out by the native chiefs, and the extent to which it can be considered as complete is doubtful.

IV. GENERAL OBSERVATIONS

The survey of existing statistical data made by Professor A. M. Carr-Saunders and Dr. R. Kuczynski has led them to the conclusion that we have not at present adequate material on which to calculate the present course of population movement south of the Sahara. The former¹ considers that there is some evidence that Africans have declined in number during the eighteenth and nineteenth centuries; not only did they bear the heavy direct and indirect losses of the slave trade, but certain diseases have found their way to Africa which were not there before, and others have spread owing to increased means of communication. These conclusions are significant in the light of estimates of the supposed population capacity of Africa, to which considerable publicity has been given. Two German calculations, based apparently upon theoretical assumptions regarding the amount of land required to support certain standards of life, put the capacity at 2,300,000,000² and 1,650,000,000³ respectively. These figures assume a higher capacity than that of any other continent and a potential capacity of 50 per cent. more than the present total world population. Another estimate places the capacity of Africa south of the Zambesi at 82,000,000.⁴ It is doubtful whether much value can be

⁴ G. Taylor, *ibid.*

attached to such statements in view of the present state of knowledge. At the moment we can only say that the population is 'probably not decreasing; it may very likely be about stationary; it is not impossible that it may be increasing, but if so the rate of increase is certainly slow'.¹ Dr. Kuczynski² agrees that it is impossible to say whether the native population of Africa has increased or decreased in numbers during the last hundred years. As for our present knowledge, there are tribes of which we may safely predict that, unless conditions improve, they may die out; there are probably others that are progressing; but for the majority it is at present impossible to say with confidence whether they are reproducing themselves or not, and in no case is it possible to state accurately the balance of births and deaths.

The varying degree of accuracy attained by the African population records is not due only to practical obstacles; the administrations themselves have shown an unequal measure of interest in census operations. The difficulty of carrying out a complete census in African conditions is obvious; the expense involved is heavy; there is, as a rule, a paucity of staff available; the physical obstacles presented by the counting of a scattered population are considerable, and governments have had to overcome opposition based on customs and superstitious beliefs.³ Some natural suspicion has been aroused by an operation which has had a traditional connexion with the imposition of tax. In most of the territories, however, the chief obstacle to an improvement of the standard of accuracy would now seem to lie in the lack of educated personnel. That India has been able to make, since 1872, a series of censuses which give a reasonably accurate knowledge of its population,⁴ is due to the fact that it has always been able to call on the assistance of a large staff of literate enumerators; in view of this, it has been immaterial that only 18 per cent. of its population is literate. With the spread of education a more comprehensive and more accurate count should become possible in Africa.

It is at the same time open to question whether, in circumstances in which any system of registration of births and deaths

⁴ A. M. Carr-Saunders, *op. cit.*, p. 269.

must be of slow growth, and migration figures are difficult to record, the ten year period between censuses is not too long; the French, though their census is for the most part based on estimates only, have nevertheless seen the necessity of conducting it at five year intervals. At present many of the administrations, in presenting their annual reports, base their calculations of the strength of the population on the figures of the last census, with an assumed factor of annual increase. The computations are, as a rule, based on insufficient data, and are of no statistical value; they are frequently even deceptive.

There is a lack of conformity in census procedure which makes the results difficult of comparison, not only as between different areas, but often within the same territory. A rigid uniformity is admittedly neither obtainable nor desirable; but there can be little justification for some of the variety which, as has been shown, characterizes the census procedure of many of the British colonies; to take only one instance, the term 'children' may be said to include persons of any age up to that at which they become taxpayers, in itself a variable figure. It would not be difficult for a committee of experts from the different colonies to establish the principles of procedure in regard to such material points as the classification of the population by country of birth, sex, age, and marital condition. Some greater degree of uniformity could also be obtained in recording racial origins, a point of much importance in regard to the classification of Europeans, Asiatics, or 'coloured', while a record of place of origin of natives would supply some of the information which would normally be derived from migration records. It is, moreover, of importance for statistical purposes that a census report should always contain clear indications of the manner in which figures have been obtained or estimated; it is, for instance, often difficult to ascertain the factor employed in calculating the total population on the basis of taxpayers, or the basis chosen in estimating the number of children.

Wide as is the field for improvement in systems of enumeration, it is, perhaps, at the moment even more important to attempt an extension of the registration of vital events. The extent and development from year to year of vital registration in British territories can be studied in the annual supplements to the

Tropical Diseases Bulletin, published by the Bureau of Hygiene and Tropical Diseases, which gives the year's record of vital statistics for all the British dependencies. At present, birth registration is confined to about 7 per cent. of the native population of the areas included in this Survey, and even here it is far from systematic. The difficulty in the extension and enforcement of the system is admittedly great; it is only in recent years that registration has taken a complete form in countries within the sphere of European civilization, and it is characteristic that India, with an administrative organization more extensive than that of any of the African territories, has not yet been able to legislate for universal compulsory registration, while such vital records as it is possible to make are officially considered to be 20 per cent. defective. A wide extension of the system, therefore, can hardly be looked for in the present conditions of Africa; and it is, indeed, preferable that an effort should be made to secure registration in those selected areas where it can be consistently applied and fully supervised. Such an application of the system might not yield figures which would provide general indices of birth and mortality rates; but the results would afford reliable evidence, of a kind now wanting, on many problems of African population statistics, and would be a useful step towards the introduction of more comprehensive statistical schemes.

African women are often credited with great fecundity,¹ but the assumption needs to be tested by fuller statistics than we now possess. In numerous areas no record of births is made; and as has been shown above, where records are kept, they are not always systematic, and refer only to a small percentage of the population. The fact that the calculated birth rate in these areas, averaging between 18 and 33 per thousand, is higher than that of many European countries but lower than that of India, cannot be made the basis of any generalizations as to the fertility of African populations. The registration of deaths, in the limited area in which such records are made, is possibly more complete than that of births, though it is likely that the deaths of infants and females often escape registration; the result is seen in the fact

¹ See, for instance, *Census of the Native Population of Tanganyika Territory, 1931, 1932*, p. 3.

that the computed figures for different areas show erratic variation. There is, in particular, an absence of data on which to judge of the correctness of the assumptions which have from time to time been made of the extent of infant mortality. There has been a general consensus of opinion that the ratio is unusually high; but estimates, founded on incomplete observation, have at times presented figures which appear clearly inconsistent with the state of the population as shown by enumerations. The South African Native Economic Commission of 1932¹ states that it received estimates for different areas ranging between 237 and 500 per 1,000; in Kenya an estimate was on one occasion given of 400 per 1,000.² The figures recorded for the British Tropical African colonies as a whole give 172·8 per 1,000 births;³ the Nyasaland selected area gave 154·6 per 1,000; the Uganda figures give 356·5 for the northern province, falling to 72·1 in Entebbe;⁴ special inquiries made during the Gold Coast census of 1931 showed a rate of 170·6; the Foréami survey in the Lower Congo⁵ gives 175·4 per 1,000 for children up to one year old,⁶ which is higher than that of any European country except Roumania. These figures, though not without value, are insufficient to afford any index of general rates of infant mortality. In the absence of an adequate system of vital registration, it is equally difficult to judge of the truth of assumptions made regarding the effects of certain African social customs, such as polygamy. The Commission for the Protection of the Natives in the Congo was so convinced of the effect of polygamy in retarding the growth of population that in 1920 it urged the Belgian Government to take gradual steps to abolish it;⁷ the truth of this assumption, however, still needs scientific examination. A population survey, undertaken by a District Officer and his wife (Mr. and Mrs. A. T. Culwick) in Tanganyika in 1937, showed that polygamy did not appear statistically to affect fertility. This survey also yielded valuable figures regarding infant mortality and sex ratios. Another aspect of the population question which needs investigation is the

effect of labour emigration, more especially in the large areas in which some 50 per cent. of the men are absent on the average. Both numbers and quality may be affected, since the unfit stay at home. It has been suggested that should it be possible to extend the system of birth and death registration, greater uniformity of practice would be achieved by an inter-territorial agreement such as has been proposed for census enumeration. It is, in particular, necessary to place still-births in a separate category, and to distinguish deaths of residents from those of strangers.

The difficulty of improving enumeration and registration has led of recent years to increased importance being attached to the method of sample survey, to which references have been made in previous parts of this chapter. This method appears to have been most successfully used in the Belgian Congo. Sample surveys have their own value, since they always add something to the current knowledge of the locality which is needed for administrative and public health work; but for the purpose of establishing population records their use is impaired by the fact that they apply only to selected groups, and that inquiry is made only regarding births and deaths occurring during the preceding twelve months; moreover, the quality of the information obtained depends largely on the personality of those who conduct the inquiry. Inquiries made during medical surveys, and figures obtained from hospital records, have their value for public health purposes; but full use cannot be made of them in the absence of data regarding the normal movement of population such as are provided by an efficient system of registration.

CHAPTER V

POLITICAL AND SOCIAL OBJECTIVES

A BRIEF review of the varying political and social ideas which have influenced those concerned with the development of African territories may serve to throw light on the systems of government to which they have given birth, and which are discussed in the next chapter.

The history of political ideals in South Africa has been that of a conflict of attitudes towards the relation between Africans and Europeans, typified by the contrast between Cecil Rhodes's phrase—'Equal rights for all civilized men south of the Zambesi'—and the clause from the original constitution of the Transvaal—'There shall be no equality between black and white either in church or state.' The Great Trek northward of the Boer farmers which began in 1836, and which led ultimately to the creation of the Transvaal and the Orange Free State, was impelled partly by a determination to acquire land which the British Government of the day hesitated to annex, partly by dissatisfaction with the economic policy of that government, but partly also by the principle involved in the recognition of legal equality between all sections of the population and in the emancipation of the slaves. This last measure caused little material hardship to the Boers, but outraged their sense of what was fitting in the relations between black and white. Opinion in Great Britain, however, has always regarded the grant of the franchise to natives in the Cape as the symbol of a policy which offered equal opportunities with the white man to any native who could attain his standards of civilization.

In 1912 a political philosophy, based on the 'segregation' of natives and Europeans, was put forward by the Labour Party. This policy assumes the permanent maintenance of the white community in a position of political and economic supremacy, and the preservation of the standards of European civilization by reducing the contacts of the two races to the minimum which the economic system necessitates.¹ General Hertzog, the present Prime

¹ See Chap. IX, pp. 346 ff.; Chap. XI, pp. 682 ff.; and Chap. XII, pp. 718 ff.

Minister of the Union, came into power on this programme in 1924, and his internal policy has been designed to complete a process initiated by the Land Act of 1913, which divided the whole territory of the Union into native and non-native areas and established the principle that the residence of natives outside the scheduled reserves is only justified if they are in European employment.¹ Economic segregation in the non-native areas is effected by measures which assign the native his place in unskilled labour, reserving skilled employment for the white man; in practice, the 'civilized labour policy' goes further and involves the reservation for white labour of certain occupations which cannot strictly be described as 'skilled'.² The colour-bar policy, however, only works effectively where there are big industries or mines, more especially where white labour is organized. The number of natives residing in urban areas is to be rigorously controlled and their locations kept separate from the European residential area.³ It is at the same time assumed in South Africa, as in Southern Rhodesia, which has adopted the same principles, that within the sphere of the native reserves the professions and skilled trades shall be fully open to Africans.⁴ The Union Natives Taxation and Development Act of 1925 embodied the principle that native development should be financed from revenue obtained from natives.⁵

The political system recently instituted by the Representation of Natives Act of 1936 rests on the negation of any extension of the native franchise, an attitude justified by General Hertzog on the ground that under a constitution which admits the possibility, however remote, of a native majority in the electorate, the native is 'a danger to the white civilization in South Africa'.⁶ Though the Cape franchise is retained, it is held on a communal basis, the number of native representatives not being calculated in any proportion to the population, while for the rest of the territory Native Electoral Colleges elect four Europeans as representatives to the Senate. There is also a Natives Representative

⁶ *Joint Sitting of Both Houses of Parliament*, Feb. 13-Apr. 7, 1936, c. 529.

Council which, under statute, must be consulted on all measures affecting native interests.¹

South Africa has favoured the acceptance of this policy in other parts of the continent where white settlement is possible. General Smuts in 1930 looked forward to the evolution of a common policy for all British African states from Kenya to the Union through a series of annual conferences.² The military as well as the political implications of this attitude were explicitly accepted in a series of articles published in the *Johannesburg Star*, in 1937, with the approval of Mr. Pirow, the Minister for Defence, in which the writer said: 'The Union has inescapable ties of common interest with all areas in Africa where white populations are endeavouring to establish a permanent home. The occupation by any strong foreign Power . . . of any part of that territory would be a direct threat to the safety of the Union.'³ The areas referred to are those in Central and East Africa—the Rhodesias and Kenya—where European settlement has taken place on a considerable scale; and, as is shown in the chapters dealing with land, the urban native,⁴ and labour, Union policy has strongly influenced Southern Rhodesia and has to some extent determined the attitude of European settlers in Kenya. There is a probability that the colour bar may be pressed for on the copper mines of Northern Rhodesia as white labour becomes organized under Union influence. Most of the British territories in tropical Africa, however, are climatically unsuitable for white settlement, and their development has been characterized by a different philosophy. Of these the West African dependencies have an older history of contact with European civilization, and in them was evolved the policy now made applicable to the predominantly native territories in the east.

The British settlements on the West African coast were a legacy of the slave trade, which, so far as British legislation and the British navy were able to enforce its suppression, was abolished in 1807. The settlements remained; the humanitarian movement saw in their development as centres of legitimate trade the means of establishing an interest which would have strong motives for

¹ See Chap. VI, p. 153.

³ *The Times*, May 19, 1937.

⁴ See Chap. IX, pp. 496 ff.

co-operating in the abolition of slaving and slavery. Thus at an early date that intimate connexion between idealism and commerce was established which has exposed African administrations to the easy cynicism of those who see in every declaration of interest in the African's welfare the veiled intention to secure benefits for the mother country.

In West Africa action against the slave trade was followed by the adoption of a policy pointing to a general withdrawal of British political influence. In the Gold Coast merchants were notified in 1827 that they remained at their own risk, and from that date until 1843 the administration of the coastal forts was in the hands of a committee of London merchants. At the mouths of the Niger the British Government maintained no authority, other than that of a naval squadron for the suppression of slave-trading, until the appointment of Mr. Beecroft as Consul in 1849. Lagos was annexed in 1861 solely because only by annexation could the slave-smuggling which was rampant there be stopped. In 1865 a Select Committee of the House of Commons advocated complete withdrawal from the coastal trading-stations at the earliest possible date. In the Gold Coast, however, the barbarous practices of the Ashanti kingdom were held to be intolerable, and in 1874 the Ashanti War marked the beginning of British penetration inland. In what later became Nigeria, this penetration was due to the enterprise of Sir George Goldie,¹ founder of the Royal Niger Company, which from 1886 to 1899 was concerned in the extension of British influence through commerce up the rivers Niger and Benue, the policing of the river against attacks from natives, and the suppression of the slave trade. The company's instructions were to maintain freedom of trade in accordance with the colonial policy of the British Government, but this freedom was not introduced in practice until the government made itself directly responsible for administration. Sir George Goldie adopted the policy of administration through native rulers which later came to be known as indirect rule,² and in doing so received the support of the early anthropologist, Miss Mary Kingsley.³

This policy was effectively developed by Lord Lugard when he

¹ D. Wellesley, *Sir George Goldie, Founder of Nigeria*, 1934.

² See Chap. IX, p. 416.

³ See Chap. II, p. 40.

was appointed High Commissioner of Nigeria in 1900, and its implications as a theory of native administration were elaborated by him in a series of *Political Memoranda* and in many published writings.¹ The principle underlying this policy, the validity of which is still challenged by other colonial powers, notably France and Italy, is that native institutions are in themselves of value as agencies of government, and that a replica of European institutions in Africa is not the aim of policy most to be desired even in a distant future. In Lord Lugard's view its political aspect must be complemented on the economic side by a form of development which would help to render the African independent of wage-labour and thus enable the village life, which is the basis of native institutions, to continue. As the policy has been developed in practice, emphasis has shifted from the preservation of native institutions to their development for new functions, and it is beginning to be recognized that these institutions, if they are to play their part in the modern world, must undergo changes which may eventually make them unrecognizable. In the other West African dependencies a similar attitude towards the advantages of a development based on native production was accompanied by a mere recognition of native authorities, without the assumption of any power which would make it possible to utilize them in the introduction of measures held to be desirable in the interests of native advancement.²

The system of indirect rule is regarded by its exponents as a better starting-point for an evolution towards self-government than any other yet devised by British administrations. Sir Donald Cameron, when Governor of Tanganyika, expressly stated that in no other way could the obligation, implied in the mandate, to 'encourage such an evolution of peoples 'not yet able to stand by themselves', be carried out. The political traditions of Great Britain involve the assumption that self-government implies representative parliamentary institutions, and this is held also by the majority of educated Africans.³ It is implicit in the philosophy of indirect rule, however, that the nature of the political

¹ *Political Memoranda*, 1918; *The Dual Mandate in British Tropical Africa*, 1929.

² See Chap. IX, pp. 465 ff.

³ See M. Perham, *Native Administration in Nigeria*, 1937, pp. 356 ff.

forms which may ultimately be involved should not be prematurely defined, and it is possible that a development deliberately based on African institutions may lead to some new type of self-governing organization.

The acquisition of the British tropical African territories took place in a period when British economic policy was dominated by the principles of free trade, and the principle of the 'open door' was conventionalized by international treaties in Nigeria and the Gold Coast, Kenya, Uganda, Zanzibar, Nyasaland, and part of Northern Rhodesia; a similar policy has been necessitated by the terms of the mandate in Tanganyika and the British Cameroons. But these territories are now feeling that they would have a better chance in the search for markets if they had a free hand in negotiations with other countries while maintaining British preferences. Where no treaty limitations are in force, the trend of policy since the Ottawa Agreements of 1932 has been to give a preference to British countries.

In those British East African territories where European settlement has taken place an opposition has frequently revealed itself between the aims of local opinion, which has favoured the South African segregation policy, and public opinion at home, which has taken the view that native interests deserve more explicit consideration. The local European communities hold that the principle of devolution, culminating in full responsible government, which has been followed by Great Britain in her relations with other British peoples overseas, is applicable also in their case. But the British Government have held that in territories where the native population form the great majority this principle must be subject to modification. Their declared policy in regard to such territories has been formulated in a series of statements which, though made with special reference to Kenya, express a general philosophy. The Devonshire White Paper of 1923 stated that

'primarily Kenya is an African territory, and His Majesty's Government think it necessary definitely to record their considered opinion that the interests of the African natives must be paramount, and that if and when those interests and the interests of the immigrant races should conflict, the former should prevail. . . . In the administration of Kenya His Majesty's Government regard themselves as exercising a trust on

behalf of the African population, and they are unable to delegate or share this trust, the object of which may be defined as the protection and advancement of the native races.¹

This conception of the position of the imperial government as the impartial arbiter between communities whose interests might come into conflict was elaborated by the Hilton Young Commission of 1929 as the basis of the constitution which they outlined for a federation of the three East African territories,² and the necessity for the preservation of its ultimate authority in matters affecting native interests has been repeatedly emphasized. At the same time, it has been felt desirable to make it clear that the paramountcy of native interests is not to be interpreted as justifying neglect of the vital interests of the European community, and that the ultimate trusteeship of the imperial government does not preclude the grant to that community of a share in the government of territories which they have made their home. The Churchill White Paper of 1927 dealt with these two points by enunciating the principle of the 'dual policy' of economic development—elsewhere defined as that of increasing native production in the reserves *pari passu* with that of European plantations—and the government's 'desire to associate more closely in this high and honourable task [of trusteeship] those who, as colonists or residents, have identified their interests with the prosperity of the country'.³ A more specific definition of the type of development involved in the paramountcy of native interests was given in the Passfield White Paper of 1930, which accepted the principle laid down by the Hilton Young Commission that 'the creation and preservation of a field for the full development of native life is a first charge on any territory', but declared that this is not 'incompatible with the common duty of any government to promote the development of the resources of the territory and the prosperity of its inhabitants, including the immigrant communities within it'.⁴ The type of development envisaged should be the adaptation of native institutions to the purposes of local self-government, with

¹ *Indians in Kenya*, Cmd. 1922, 1923, p. 9.

³ *Future Policy in regard to Eastern Africa*, Cmd. 2904, 1927, p. 7.

⁴ *Memorandum on Native Policy in East Africa*, Cmd. 3573, 1930, p. 5.

the possibility that native and settled areas might eventually be placed under separate administration; the improvement of native hygiene, standards of life, and general education; and the development of native production in a way which would make the native effectively free to choose between independent cultivation or wage labour as a means of earning his cash requirements. As regards the political future of Kenya, Lord Passfield stated that dominion status was the ultimate goal, but could not be attained until the native community were able to participate in self-governing institutions.

Opinion among the European communities in East Africa held that this statement implied a certain failure to appreciate their problems and legitimate interests, and the Joint Committee on Closer Union discussed their criticisms and included in their report a statement which may be taken as the most authoritative interpretation so far given of British policy on this question. They conclude that the European community should have a right to effective representation, and to protection against policies which would fundamentally change the economic conditions on the basis of which they settled in the country. Pointing out that the principle of paramountcy was enunciated in relation to specific points, particularly in connexion with land and labour questions, on which a direct conflict of native and non-native interests might arise, they add that 'the doctrine of paramountcy means no more than that the interests of the overwhelming majority of the indigenous population should not be subordinated to those of a minority belonging to another race, however important in itself'.¹

The early development of the East African territories was characterized by a belief that their future lay with large-scale European agriculture, and that policy should concentrate on encouraging settlement, making land available, and stimulating the flow of native labour. It is, however, now recognized in some areas at least that the high cost of European enterprise makes it uneconomic where the commodities produced have to meet the competition of native production in an African market or can only command a low price in an external market. In all these terri-

¹ Joint Committee on Closer Union in East Africa, *Report*, H.C. 156, 1931, para. 73. See Chap. VI, pp. 167-9.

tories native education, the encouragement of native production, and the development of native institutions for local self-government have been the object of increased attention from the imperial government in the years from 1925 onwards. No industrial colour-bar exists in the British East and West African territories, but the principle of financial segregation in force in the Union seems to have been implicit in the minds of the European community of Kenya when they agreed to the imposition of an income tax in 1937 on the understanding that they should not be asked to contribute to the extension of native services.¹

The philosophies which lie behind the administration of Uganda and Tanganyika are akin to those reflected in the development of Nigeria, and in the case of Tanganyika were inspired by them.

The most striking contrast between the colonial policies of France and Great Britain lies in the centralizing tendency which inspires the relations of France with her colonial empire. Economically the aim is that the mother country and the colonies should form a unit: and France has at all times pursued a protectionist policy in all her territories except those in which she was debarred by international agreements or by the mandate. Politically she appears to look to a future in which the advance in civilization of the subject peoples will be recognized not by the creation of local representative institutions but by fuller representation in the central government. This centralizing attitude is bound up with the 'assimilationist' theories which had their origin in the equalitarian doctrines of the French Revolution and which remain at the root of French colonial philosophy. The development of political institutions in the French colonies, described later,² has kept the institutions of the home country as its model. The grant of the franchise to the Senegalese remains the fullest practical application of the theory that all the children of France are equal. This theory was readily accepted as a basis of policy at the time of the *sénatus-consulte* of 1854, when the colonial empire was confined to small areas which had already been long under European influence; but with its extension in the years following 1890 to great areas the population of which had little previous contact with European civilization, the principle of assimilation gave way to that of

¹ *The Times*, Dec. 12, 1936.

² See Chap. VI, pp. 185 ff.

'association', which was first defined by M. Jules Harmand in 1910 and later by M. Albert Sarraut. This theory, as first put forward, appeared comparable to the theory of indirect rule; the colonizing power was now to adopt, as a principle, a well-watched and well-directed conservation of the institutions of the subject people and a respect for its past.¹ In M. Sarraut's works the aspect of the policy which its name indicates, the 'association' or 'collaboration' of the native *élite*, who have appreciated and accepted the standards of civilization, in the work of colonial development, receives more emphasis.² Few French colonial writers would extend the principle of respect for native institutions to the point where they were regarded as worthy of maintenance in the face of changed conditions; the respect which is inculcated is rather a sympathetic tolerance during the period which must elapse before their inevitable disappearance.

Economically France adopted in the early days of Equatorial Africa the system of development by monopolist concessions, which was found to be the only means, consistent with the provisions of the Berlin Act, by which commerce could be kept in the hands of the colonizing power; but this method was soon found to be unprofitable, and most of the concessionaire companies willingly agreed to the retrocession of their rights before the end of the period for which they were made.³ Policy in French West Africa never relied on the concessionaire system, but sought to develop the country by reliance on native agencies. That is also the reigning policy in the French Cameroons.

A general philosophy of economic development for the colonial empire was formulated by M. Sarraut when, as Colonial Minister in 1922, he conceived a planned development in which each colony should contribute its quota of the product for which it was best suited, while at the same time means of transport were to be improved on a large-scale plan. The policy of association was closely bound up with this scheme; the native *élite* had a definite part in the expansion of production. The division of the educational system into two programmes for the *élite* and the masses is

¹ J. Harmand, *Domination et colonisation*, 1910, pp. 158-9.

² See *La mise en valeur des colonies françaises*, 1923; *Grandeur et servitude coloniales*, 1931.

³ See Chap. XII, pp. 786 ff.

a further illustration of this attitude.¹ Although financial conditions made impossible the simultaneous execution of M. Sarraut's full programme throughout the colonial empire, it led to the adoption of a planned system on a smaller scale, in which each colony adopts a programme of cultivation to be carried through each year, and so far as possible the products thus secured are protected by a preferential tariff on entry to the French market. This form of economic development has been described in the phrase *mise en valeur*;² but French colonial philosophy has sometimes tended to look far beyond the economic sphere for the values which it hoped to find in overseas France. The cultural potentialities of Africans have in certain respects received more encouragement from the French than from other imperial powers; and the value of African man-power is made effective by a system of military conscription,³ two years for citizens and three years for subjects. It has been realized, however, that, since large sections of the population of French West and Equatorial Africa are physically unfitted for service, they afford a less important reserve of man-power than was once expected.

The inquiry into the aspirations of the colonial populations set on foot by the *Front Populaire* Government in 1937 originated with a body of opinion which looks to the development of representative institutions as the best way of safeguarding native interests and thus represents a reaction to the assimilationist policy. This movement shows the strength of the feeling that the political future of the colonies must lie in the development of European institutions and illustrates the contention that the difference between the policies of assimilation and association is one of tempo rather than of principle.

The revulsion of feeling against the policy of exploitation followed by King Leopold II from the foundation of the Free State in 1884 led to the annexation of the territory by Belgium in 1908. The desire to safeguard the interests of the natives led to the elaboration of a colonial constitution giving the *Chambre* a measure of control over the grant of concessions, and to the creation of a special commission for the protection of natives;⁴ it is no

⁴ See Chap. VI, p. 208.

doubt because of the previous history of the Congo that Belgian public opinion has taken a marked interest in the modern administration of the colony. There was, however, little opportunity for constructive work until after the Great War, and partly for this reason policy with regard to certain problems has not so far been fully formulated. M. Louis Franck, when Colonial Minister in 1923, outlined a plan of political development based on the reconstruction of the native groups which had been destroyed during the Free State period. The earlier sentiment in favour of assimilation is exemplified by the easy facilities offered for the registration of Africans as subject to European law, and by the policy advocated by the present King, when Duke of Brabant, of universalizing individual freehold tenure;¹ but the educational system, with its essentially vocational character in which the teaching of French is kept to a minimum, is based on the principle of development on African rather than on European lines. The more recent development in native administration, and in the system of law and justice, would indeed seem to point to a policy with greater affinity to that of indirect rule than that associated with the theory of assimilation. A peculiar feature of the Belgian Congo is the relation of the government to the commercial companies established under Leopold II. As heir to the Free State, the government is a principal shareholder in these companies, a situation which necessarily influences its economic policy and can render the position of individual officials somewhat ambiguous. Economic policy has been dictated partly by the existence of large mineral deposits, partly by the *fait accompli* produced by King Leopold's concession policy. These two factors have made the development of large-scale enterprise inevitable; it has however been conducted latterly with more regard for the welfare of native labour than in most of the other territories in Africa. There is no colour-bar, and since the recent depression native skilled labour has been extensively used to replace that of Europeans. In addition to industrial development a policy of the extension of native peasant production by making obligatory the cultivation of a fixed area, or the planting of a quota of trees each year, has been actively followed since 1917. A special feature of Belgian policy is the attitude towards Christian missions.²

¹ See Chap. XII, p. 862.

² See Chap. XVIII, p. 1270.

Education is almost entirely in their hands, their work is assisted by subsidies, and it is held to be closely bound up with the development in the Congo of the sentiment of loyalty to Belgium, which was necessarily absent while the Free State was the private domain of an individual monarch; a marked discrimination is made between national and non-national missions.

If this review of political and social objectives has been of a summary nature it is because the character of an administration can be judged more clearly from its treatment of concrete issues than from abstract declarations of policy. The latter, framed for the most part to meet the political exigencies of the moment, have moreover frequently been such as to combine the minimum of definite guidance to the colonial executives concerned with the maximum difficulty of interpretation. The Kenya White Paper of 1923, in its declaration of the paramountcy of African interests, was no doubt a genuine attempt to indicate a liberal policy; but the subsequent efforts to elucidate the meaning of this declaration led to a controversy which was as barren of result, and often as bitter in character, as any of the great theological disputes of the past. The real test of British intentions in Kenya lay in the treatment of the land question,¹ or the apportionment of expenditure between objects affecting Europeans and Africans.

It is again relevant to consider the nature and force of the interest which the public of the mother country brings to bear not only on the major issues, but on the everyday treatment of colonial questions. Long tradition has given the English public a wide experience of colonial affairs; and it is characteristic that its sentiment is as keenly aroused over moral as over material issues. Possibly no other country could furnish an analogy to the long and absorbing interest evinced in the discussions which produced the Government of India Act of 1935; and it is perhaps not always appreciated in South Africa that general interest in the proposed transfer of the High Commission territories to the Union is due to a conflict between a sense of moral obligation and arguments of political convenience. Continental opinion is at the same time apt to remark that if British interest in colonial issues is genuine and well informed, it is nevertheless deficient in definition of

· ¹ See Chap. XII, pp. 742 ff.

objective and of the method of approach; policy is indeed characterized as a series of improvisations which depend for success not on a logical outlook, but on the exercise of a traditional skill in accommodating principles to circumstances. That is a criticism which has in particular been applied to the system of indirect rule; without questioning the moral sentiment on which the system is based, the critics contend that it is dangerous to proceed with such enthusiasm along a path of which the end, so far from having been defined, has not even been seriously considered. On the other hand it may be remarked that it is one of the paradoxes of colonial history that English policy, lacking though it may be in a logical study of its aims, has nevertheless been more consistent in its results than that of the French. French policy is never at any one time deficient in logical definition of its objective, but the attempt to maintain a policy in the face of varying circumstances has more than once forced a radical change in the objective itself, and in the administrative methods which serve it. In France public opinion in colonial affairs has not the same tradition as in Great Britain. Interest has been keenly aroused on such issues as the use of the colonies as a reservoir of man power for the army, or the policy of *mise en valeur* associated with the name of M. Sarraut; there is again in some quarters a more sympathetic interest in native culture than is to be found in England; but for the rest, concern in colonial matters is largely associated with party politics, and the literature dealing with the colonies is far less in extent, and makes less appeal to the general public, than that of Great Britain. In Belgium interest in the Congo arises from a double source. The public is widely concerned, both collectively and individually, as shareholder in Congo enterprises; but there exists perhaps a sentiment of even greater force in the general determination that the present-day rule of the colony should be such as to present the strongest possible contrast to the history of the Free State under Leopold II.

CHAPTER VI

SYSTEMS OF GOVERNMENT

IT is not possible within the scope of this Survey to enter into a detailed account of the system of government in each of the territories concerned. It is, however, necessary to give some outline of their legislative and executive organization, and the constitutional relations which exist between colonial or protectorate governments and the mother country. It will be appropriate also to consider here certain connected topics, such as the proposals, which have been made for the re-grouping of certain of the administrative units, the method of supervision over mandated areas, and the method of recruitment and conditions of service of administrative establishments.

I. THE UNION OF SOUTH AFRICA

In the comparative study of systems of government in the African territories, the significance of the position of the Union lies in the fact that to-day, among all the countries of the continent, it, Egypt, and Liberia are alone independent of external control. The culmination of the traditional British policy of progressive devolution to local legislatures is seen in the fact that the dominions are—to use the formal definition accepted in 1926—now recognized as ‘autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown and freely associated as members of the British Commonwealth of Nations’.¹ Since in dominion matters the ‘Crown acts on the advice of its ministers in the dominion’, the dominions now have full control of their external affairs; they may nominate their own diplomatic representatives and may conclude treaties with foreign powers. They are independent members of the League of Nations. If it is sought to obtain a closer interpretation of the relations thus created between different members of the Commonwealth of Nations, it must clearly be looked for in the views expressed by the government of each

¹ *Imperial Conference 1926, Summary of Proceedings*, Cmd. 2768, 1926.

dominion in regard to its obligations towards Great Britain or others of these 'autonomous communities'. The recognition of dominion status implies that in this respect a dominion is a sovereign state; neither Great Britain nor the collective vote of other dominions can impose any obligation on it. This consideration gives particular importance to the interpretation which South Africa has placed on its status vis à vis Great Britain.

It was inevitable that after the establishment of the Union the division between Dutch and British—the former representing, on the last occasion when the census¹ classified Europeans by descent, 57 per cent. of the population, the latter 34 per cent.—should reappear in the formation of political parties; the so-called 'one stream and two stream' schools of thought were concerned not only with internal developments but with the question whether the destiny of the Union lay in membership or independence of the Empire. The first government of the Union represented a South African National Party, predominantly Dutch in membership, but supported also by the rural Anglo-Saxon population of the Transvaal and the Cape; General Botha, the Prime Minister, favoured a policy of inter-racial co-operation and acceptance of the imperial connexion. As early as 1912, however, his Minister of Justice, General Hertzog, caused him so much embarrassment by his strongly nationalist declarations that he resigned and reformed the ministry without him. From 1915 onwards General Hertzog's Nationalist party, pledged to independence of imperial control, to 'redress the wrongs done in 1902' and secure 'a truly free South Africa',² increased in numbers until in 1929 it had a clear majority in Parliament. General Hertzog first became Prime Minister in 1924 with the support of the Labour Party, on the understanding that the question of secession should not be raised during that Parliament. It accordingly fell to him to attend the Imperial Conference of 1926 at which the equality of status of the dominions with Great Britain was explicitly recognized, and on his return to South Africa he expressed himself as completely satisfied with this position.³ In 1930, however, the Union Parlia-

¹ See S. G. Millin, *The South Africans*, 1934, p. 206; *Union of South Africa Census Report*, May 4, 1926, part iv.

² *The Round Table*, vol. x, 1919-20, pp. 191, 203.

³ *Ibid.*, vol. xvii, 1926-7, p. 394.

ment, in accepting the report of the Conference on the Operation of Dominion Legislation, which was the basis of the Statute of Westminster of 1931, adopted a resolution providing that it should not be 'taken as derogating from the right of any member of the British Commonwealth of Nations to withdraw therefrom'.¹ On the acceptance by the Union Parliament of the Statute of Westminster, which defines the relationship of the British Dominions as one of common allegiance to the Crown, General Hertzog stated that 'we have now come to finality with regard to our constitutional freedom'.²

The Status of the Union Act of 1934 was passed by a coalition of the Nationalist and South African parties, which included in its programme 'the maintenance of the existing relationship between the Union and the British Commonwealth of Nations and co-operation with its members, subject, however, to there being no derogation from the status of the Union, and no assumption of external obligations in conflict with its interests'.³ This measure defined the relation of South Africa to the Empire. Its most significant features are the description of the Union in the preamble as 'a sovereign independent state', the provision that in South African matters the King acts on the advice of his ministers in the Union, and the amendment of the form of the oath of allegiance so as to delete the description of the King as 'of the United Kingdom'. It appears to be the view of the South African government that their interests are now sufficiently safeguarded;⁴ but the position taken up by them meets with opposition from two directions. A Dominion party, led by Colonel Stallard, stands for the development of South Africa as 'an integral and indivisible part of the British Empire', while a Nationalist opposition under Dr. Malan aims at 'a republic, but not necessarily in our time',⁵ and has urged the formal affirmation of the right of secession on occasions such as the introduction of the Abdication Bill in 1937.

The question of their position when Great Britain is at war has exercised the statesmen of most of the dominions. In the opinion of a high authority⁶ the neutrality of the dominions when Britain

⁶ A. Berriedale Keith, *Responsible Government in the Dominions*, 1928, pp. 867, 872.

is at war is a legal impossibility. It was pointed out by General Botha¹ that in practice the question of neutrality will be for the enemy to decide, and Mr. Pirow has admitted the possibility of meeting an enemy 'so stupid that he cannot understand our constitutional position'.² The claim to the right of neutrality, however, has been frequently urged by the Nationalist party in the Union; while in opposition General Hertzog declared that neutrality was 'an unassailable right and must necessarily be so of any country which possesses the right of self-government'.³ The South African Party government in 1912 introduced a Defence Bill which provided for military defence, but they made no mention of naval defence beyond the statement that 'the main defence of the South African coast line and security of South African shipping must necessarily rest with the maintenance of sea-power by the British Navy'.⁴ Great Britain maintains a naval base at Simonstown on the Cape of Good Hope, and in 1922 the Union agreed to take responsibility for the maintenance and manning of the forts commanding it. The Nationalist opposition has proposed to protect South African neutrality by the outright cession of Simonstown 'as another Gibraltar'. General Hertzog has stated that from the standpoint of international law 'there is no difference in principle between Simonstown and Gibraltar', and that if the Union claimed neutrality Simonstown could be treated as foreign territory.⁵ Nevertheless, he expressed in 1935 a point of view which did not differ in essentials from General Smuts's declaration in 1928 that 'the great sheet-anchor of South Africa's liberty is the British fleet'.⁶ General Hertzog's words were: 'As far as its value is concerned, I feel the same about it as an Englishman does, because the freedom of my people and of my country is just as dependent upon it as England is herself.'⁷

The existing legislative and administrative organization of the Union is in essentials that created by the Act of Union. The four constituent units, the Cape, Transvaal, Orange Free State, and

⁷ *Ibid.*, vol. xxv, 1934-5, pp. 488, 492.

Natal, retain their separate entity as provinces with a degree of local autonomy which they exercise in their own right and not by delegation from the central authority. Each province has a council whose numbers equal that of the provincial members of Parliament, but with a minimum of twenty-five members, elected on the same franchise as the members of Parliament and holding office for three years. An executive committee of four members is elected by each provincial council, not necessarily from its own members.

Provincial councils are empowered¹ to legislate on the raising of direct taxation, the borrowing of money, education other than higher education, agriculture, hospitals, local government and public health institutions, and a variety of purely local matters or matters delegated by the Union Parliament. Provincial legislation can have effect only in so far as it is not repugnant to Union legislation. The Union government may refuse assent to provincial legislation and may pass laws overriding such legislation.² A considerable measure of control over finance is exercised by an Administrator appointed by the Union government as chief executive officer in each province. He is chairman of the executive committee, on which he has a casting vote, and no financial measure can be introduced without the approval of this committee. In practice the dependence of the provinces on the Union Parliament for financial assistance has given the latter body a direct influence in their affairs.

The central government consists of an elected House of Assembly with a Senate partly elected and partly nominated. The Senate has 32 elected members, 8 from each province. They are elected by the members of the provincial councils and the members who represent the province in the Union Parliament; the method used is proportional representation with the single transferable vote. Eight senators are nominated by the Governor-General in Council. Four of these are selected for their knowledge of native affairs. The normal duration of the Senate is ten years.³

The representation in the Union House of Assembly allotted to

¹ South Africa Act, 1909, section 85.

³ W. P. M. Kennedy and H. J. Schlosberg, *Law and Custom of the South African Constitution*, 1935, pp. 188-9, 245-7.

the four provinces in the South Africa Act was not determined in proportion either to their population or number of electors. In order to allay the apprehensions of the Free State and Natal, the distribution of seats was weighted in their favour; provision was made, however, for future readjustments on the basis of the quinquennial censuses, and the allocation made on the basis of the 1931 census gives 61 members to the Cape, 57 to the Transvaal, and 16 each to Natal and the Free State.¹

A federal constitution of the type of that adopted at union would seem in practice to involve certain consequences. It undoubtedly makes for unity of action. But it leaves with the provinces only certain scheduled functions, while conferring on the centre all residual power and a general overriding authority in legislation. The distinctive policies which formerly characterized certain of the provincial governments—notably that of the Cape—are now subjected to the vote of the majority in the Union; the seat of power now rests in large measure in the Transvaal. It was the position assigned to the provinces which in 1922 counted largely in turning opinion in Southern Rhodesia against federation with the Union;² as a fifth province its policy would have been entirely subordinated to that of the Union. The experience of the existing four provinces has shown that all executive authority tends increasingly to be centralized, and there is in practice a decreasing measure of local autonomy.

If South Africa is distinguished by the extent of the racial division in its European population, it is in another respect unique among the dominions. The white population to which its government is responsible is greatly outnumbered by the native;³ and it is further a fact of significance in South African politics that the British and Dutch look back upon a history of divergent opinions with regard to native policy. This divergence has found its strongest expression in connexion with the franchise and the right to acquire land. The latter question is dealt with in Chapter XII, but some account must be given here of the question of the native franchise. If in modern times the question has no longer divided the two sections of the European population to the same extent as

¹ *Ibid.*, pp. 192-4.

³ See Chap. IV, pp. 108-9.

² See below, pp. 178-9.

before, it has nevertheless formed one of the outstanding issues of Union politics.

The Transvaal and Orange Free State never extended the franchise to any but their white population. The native policy which differentiated the Cape from the republics founded by the Trekkers was embodied in the Fiftieth Ordinance of 1828, which cancelled all laws differentiating against the Hottentot population.¹ The constitution granted to the Cape in 1853 extended the franchise on equal terms to all male British subjects, on the ground that 'all Her Majesty's subjects, without distinction of class or colour, should be united by one bond of loyalty and a common interest'.² In 1872 the government was made fully responsible to the local electorate. Some misgivings began to be felt towards the end of the nineteenth century with regard to the equalitarian policy. At the time of its first adoption the non-white population of the Cape was small, but as its territory was extended by the annexation of lands inhabited largely by Africans, a 'swamping' of the electorate by the native vote began to be feared. The registration of native voters began in considerable numbers in 1884. The introduction of an education qualification in 1892,³ though of general application, was intended to keep 'blanket kaffirs' off the register.⁴ The same Act raised the general qualification to property worth £75 or income of £50. The Glen Grey Act of 1894, in providing for the allotment of individual holdings to natives, laid down that occupation of land under its terms did not qualify for the franchise.

Natal had a short existence as a Boer republic from 1839 to 1845, when British authority was imposed largely as a means of enforcing the British view of native policy. Representative government was established in 1856,⁵ responsible government in 1893;⁶ natives were not explicitly debarred from the franchise, but the Native Franchise Act of 1865, while imposing the same property qualifications on all sections of the community, set up a difficult and restrictive procedure for the registration of native and Asiatic voters. The opposition between the attitude of the Cape and the

⁶ Act 14 of 1893.

Transvaal on the matter of the franchise formed one of the most serious obstacles to any union or federation of the South African states. When in 1902 the British government annexed the republics, the terms offered included not only the promise of self-government but an assurance that no native franchise would be given until this had been attained.¹ It was recognized at once, however, that political union implied a unified native policy, and a Native Affairs Commission appointed in 1903 spent two years in the study of this question, dealing principally with the questions of land tenure and the franchise. They found that in the Cape there were 8,117 registered native voters out of a total electorate of 135,168, and that in 7 constituencies out of 46 the native vote was strong enough to determine the issue of an election.² The Commission came to the conclusion that a franchise 'which makes the organized native vote the arbiter in any acute electoral struggle . . . is an unwise and dangerous thing', and proposed the creation in each colony of native constituencies in which Africans should vote separately from Europeans.³

The question of native franchise necessarily came before the National Convention which met during 1908-9 to decide the constitution of the Union, subject to the approval of the imperial Parliament. To the latter the line to be adopted on this question appeared to be of crucial importance for the future of native policy in South Africa. The Cape delegation, supported by the High Commissioner, Lord Selborne, proposed a uniform franchise dependent upon a civilization qualification, which would have admitted some natives while excluding some of the 'poor whites'.⁴ The delegates from outside the Cape preferred the abolition of any native franchise. Finally it was decided to retain the existing position, the Cape franchise being 'entrenched' by the provision of the South Africa Act that it could be modified only by a two-thirds majority of both houses sitting together.⁵ The right of natives and coloured persons to sit in Parliament, which had been implicitly theirs in the Cape, was now explicitly withdrawn.

⁵ South Africa Act, 1909, section 35.

The question of the franchise was raised again as an element in the policy of racial segregation when the Nationalist party came into power in 1924.¹ In Natal the difficulty of registration was such that no more than three natives had ever acquired the vote,² but in the Cape, as has been seen, the native electorate had acquired political significance. A Bill providing for the abolition of the Cape franchise and the provision of a limited parliamentary representation of natives throughout the Union, voting on a separate register, was introduced in 1926, but in 1929 failed to obtain the necessary majority of both Houses together. The native electorate attained its maximum of 16,480 in 1927. Between 1930 and 1933 some 6,000 native voters were disqualified³ by the strict interpretation of a clause⁴ under which the qualifying income must have been earned during the twelve months preceding registration with a break of not more than one month. The European franchise was extended in 1930 to all white women over 21, and Act 41 of 1931 removed the property qualifications previously imposed in the Cape and Natal, and thus introduced universal adult suffrage for the European population. In 1933 the native voters formed 1.2 per cent. of the Union electorate and 2.7 per cent. of the Cape electorate;⁵ in 1934 they represented over 5 per cent. of the electorate in 13 of the 61 constituencies in the Cape Province.⁶

The attack on the native franchise was renewed in 1934 and the following year. The fact that the policy of segregation had already become effective throughout the Union in other aspects formed a powerful argument for the completion of the process by the separation of the natives from the European electorate. The Representation of Natives Act was finally passed in 1936. It provided two forms of representation. In the first place four additional seats are created in the Senate, to be filled by Europeans elected by the native vote. For this purpose the Transvaal and Free State form a single electoral area, while the Cape and Transkei are separately represented, the fourth constituency being Natal. The number of electoral areas may eventually be increased

⁶ J. Lewin, *The Times*, May 3, 1935.

to not more than six, but no increase is to be made before 1943. The native representatives in the Senate hold office for five years irrespective of any dissolution. The second organ of representation for the native community is the Natives Representative Council of 22 members, consisting of 12 elected and 4 nominated native members, with the Secretary for Native Affairs as chairman, and the five Chief Native Commissioners, who do not vote. Members of this council hold office for five years, but may be dismissed by the minister for misconduct. The council's powers are purely advisory. It is to be summoned before the opening of every session of Parliament in order to report upon the estimates of moneys to be applied for native purposes; it is also to report upon proposed legislation in so far as it may affect the native population, or any matter referred to it by the Minister for Native Affairs, and may recommend legislation in the interests of natives.

For the election of the four European senators who represent native interests, and of the Natives Representative Council, an elaborate machinery is created. In each electoral area an electoral college is established, consisting of the 'voting units' of the area. For the Transkeian Territories these are the native members of the General Council.¹ Elsewhere the units are local councils, chiefs or headmen in areas where there are no local councils, and the native advisory boards which exist in urban areas. In areas where no native authority of any of these types exists, an electoral committee is elected by the resident taxpayers. Each electoral college elects one senator. In the Natives Representative Council one of the nominated members must be from each of the four areas. Of the elected members, three are elected by the Transkeian General Council; in the other electoral areas the native advisory boards (representing urban areas) each elect one member; the other units in the electoral college two. It is clear that the large size of these constituencies must present considerable obstacles to electoral campaigning and to the maintenance of effective relations between the members of the council and their constituents.

The measure as originally introduced would have abolished the Cape native franchise, but in its final form the Act makes a

¹ See Chap. IX, p. 353.

compromise based on proposals made by several members from the Eastern Cape,¹ who had throughout strongly opposed the abolition of the franchise. The Act as passed maintains the Cape native franchise, but provides for separate election by the Cape native voters of three members of the House of Assembly, and two members of the provincial council, who are to be additional to the existing members, and to hold office for five years irrespective of a dissolution. The Natives Representative Council met for the first time on December 6, 1937. It was opened by General Smuts, who described the council as 'the logical outcome and culmination of the movement' to call upon natives to give their advice and to assist constitutionally in their own government.² The native members included five chiefs, the principal of a high school, three editors of newspapers, two farmers, a builder and contractor, and a lawyer's clerk. The representatives asked that a process of 'Bantuisation' of the government service in the native reserves should begin.

The franchise remains open to coloured and Asiatic voters in the Cape on the same qualifications as are imposed on natives, and in 1935 there were 23,392 coloured and 1,401 Asiatic voters. In the course of the debates on the Representation of Natives Bill assurances were given that no change would be made in the franchise open to coloured persons; but the definition of a native now in force may operate to restrict the registration of such persons. A Coloured Persons Rights Bill introduced in 1926 proposed that in each of the provinces other than the Cape, coloured persons possessing prescribed property, education, and civilization qualifications should elect one member to the House of Assembly. At the end of seven years they might be admitted to the general register. This was one of the four bills by which General Hertzog proposed in 1926 to implement the segregation policy, and since he took the view that all four were interdependent, the failure to secure the requisite majority for the abolition of the Cape franchise caused them to be dropped at that time. Though the other measures were introduced later the question of the coloured franchise has not been raised again.

¹ *The Times*, Feb. 11, 1936.

² *Report of Proceedings of Natives Representative Council, Dec. 1937*, U.G. 7, 1938, pp. 12, 14.

Of the value of the new system of native representation it is too early to speak; it is not indeed certain that political opinion in the Union has yet clearly envisaged the function which the new institution is intended to fulfil. The primary interest of a large number of the European voters undoubtedly lay in the abolition of the Cape franchise, and in the permanent exclusion of natives from any share in the Parliamentary electorate. Many accepted the Natives Representative Council as an institution which, since it did not trench in any way on the European field, might at least be viewed as innocuous, though there were at the same time some who were opposed to granting natives for the first time a statutory right to combine in an expression of their opinions, or in a discussion of their relations with Europeans. It was perhaps only a minority which believed that the council would form an effective means of securing for the native an improvement in his social and material conditions. Some of those who observed the first proceedings of the Representative Council were struck with the possibilities it seemed to offer,¹ but the vitality of a consultative body created as part of the institutions of government depends on the attitude which the administration takes towards its proceedings. Unless its influence is acknowledged, and some deference paid to its views, it is apt either to fall into inanition or to enter on a course of factious opposition. The future of the council depends therefore largely on the possibility that the party predominant in Union politics will be interested not in the more negative aspects of segregation, but in a constructive policy designed to enhance the value of the contribution which the native can make to the life of the Union.

II. SOUTH-WEST AFRICA

At the time of the assumption by the Union of the mandate for South-West Africa some 11,000 German settlers remained in the territory; immigration, principally from the Union, has brought up the European population to a total of 30,407 in the Police Zone.² This population was endowed with a limited

¹ *Manchester Guardian Weekly*, Jan. 28, 1938.

² *Report by the Government of the Union of South Africa to the Council of the League of Nations on South-West Africa*, 1936, para. 640. For Police Zone, see Chap. IX, p. 375.

measure of self-government, comparable to that enjoyed by the provincial governments in the Union, in a constitution granted by Union Act 42 of 1925. There is a legislative assembly of 18 members, of whom 12 are elected by adult male Europeans of British nationality and 6 nominated by the Administrator. In this connexion it should be explained that the South-West Africa Naturalization of Aliens Act of 1924 provided for the automatic naturalization of ex-enemy residents in the territory who did not expressly state that they wished to retain their former nationality. In 1926, however, the Union Naturalization Act, which was extended to this territory, increased from two to five years the period of residence required before naturalization; Union nationals acquire voting rights in South-West Africa after a residence of six months.¹

The competence of the assembly does not include legislation regarding native affairs, mineral rights, railways, the organization of public revenue, the judicial system, postal services, control of armed forces, immigration, tariffs, and currency. On these matters the Administrator, who represents the Governor-General in the territory, legislates by proclamation. Further subjects were reserved for a period of three years from the establishment of the constitution, after which the Governor-General was empowered to declare the competency of the assembly on any one of them. These were the police force, civil aviation, education, land banks, and the disposal of crown land. These powers have not, however, been granted. On all these matters the assembly may pass resolutions recommending the issue of a proclamation enacting or amending a law; in other matters it is competent to legislate by ordinance. Ordinances require the assent of the Administrator, who may refer them back with proposed amendments or reserve them for the decision of the Governor-General. In this he acts with the advice of an advisory council consisting of the executive committee of the assembly, namely, 4 members elected by it, and 3 persons appointed by himself, subject to the approval of the Governor-General, of whom one must be selected for his knowledge of native affairs.

¹ *The Round Table*, vol. xxv, 1934-5, p. 196.

III. SOUTHERN RHODESIA

Southern Rhodesia stands politically in a position intermediate between that of a dominion subject to no external control and a crown colony in which the legislature is responsible to the imperial government. This territory, along with what is now Northern Rhodesia, was brought under British administration by the British South Africa Company, which in 1889 obtained a charter empowering it to operate in the area north of the Transvaal and British Bechuanaland, no northern limit being fixed.¹ Southern Rhodesia was constituted in 1898 by the union of Mashonaland and Matabeleland, which had been brought under the company's administration as separate units in 1894 and 1898 respectively. The aim of Cecil Rhodes was the early establishment of responsible government; but the constitution granted by the Southern Rhodesia Order in Council of 1898 provided for a legislature with only a minority of elected members, and expressly reserved control over native affairs to the imperial government.² In 1914 the number of elected members of the legislature was increased to 12 as against 6 nominated members. The term of the charter was fixed at twenty-five years from 1889. On its expiry in 1914, however, the only alternative to its renewal appeared to be the incorporation of Southern Rhodesia in the Union, a development which the predominantly British electorate did not regard with favour, and the charter was prolonged for ten years. In 1922 a referendum on the question of incorporation with the Union resulted in a majority for independence, and since that time it has been held that the future of the territory is more closely bound up with that of the areas to the north of it.³ Southern Rhodesia was formally annexed to the British Crown in 1923, and the new constitution laid down in Letters Patent of that year and creating responsible government came into force in 1924. The difference between Southern Rhodesia and those territories which can claim to have full dominion status lies in this, that while the former has an executive government responsible to its elected legislature, certain specified classes of its legislative acts are still subject, under the Royal Instructions issued to the Governor with his commission,

¹ *Cambridge History*, op. cit., p. 533.

² See Chap. IX, pp. 376-7.

³ See below, p. 179.

to reservation for the pleasure of the Crown, and to disallowance by it. Further, certain executive acts, relating in the main to the conduct of native affairs, are subject to the assent of the Crown. The Crown in this case acts on the advice of ministers in the United Kingdom.

A peculiarity of the Southern Rhodesian constitution is that the supervision of the imperial government over native affairs is exercised through the High Commissioner for South Africa. His approval is required for the constitution of the Native Affairs Department, the fixing of its officers' salaries and the dismissal of officers belonging to it, and his consent is necessary before regulations imposing differential restrictions on natives may be introduced under laws which do not specifically provide for differentiation. Native lands are vested in him. He may request the Governor in Council to refer any question relating to natives to judicial inquiry, and the imposition of fines as a punishment for revolt requires his approval, which is also necessary for the establishment of native councils. Under the Land Apportionment Act of 1930 his approval is required for regulations made under the act and particularly for the authorization of non-natives to acquire land in the native area.

On May 11, 1934, the assembly passed a resolution urging the grant of full responsible government to the colony, though it was agreed that the demand for full dominion status, involving the independent control of foreign relations, was premature. As the Prime Minister, Mr. Huggins, put it: 'They wanted freedom in connexion with their own domestic affairs. . . . But they wished to remain in the closest contact and in the closest constitutional relations with the mother country.' He was not prepared to demand the full control of native affairs before the constitution of a second chamber.¹ The Prime Minister visited London in 1934 to put his case before the Secretary of State. A draft constitution embodying the amendments agreed upon was published as a white paper in 1936,² and received the royal assent as an Act of the Southern Rhodesian Parliament in October 1937. Certain heads have been removed from the list of bills which it is compulsory to reserve.

¹ *The Times*, May 12, 1934.

² *Proposed Amendment of the Southern Rhodesian Constitution*, Cmd. 5218, 1936.

It is agreed that the officials of the Native Department have been given reasonable security of tenure by the local Public Services Act of 1931, and that the High Commissioner's right to order a judicial inquiry and the necessity of obtaining his approval for measures dealing with native councils might be allowed to lapse. The clause empowering the Governor to impose fines in case of revolt is to be dropped entirely from the constitution. On other matters¹ the home government was not prepared to relinquish its right of supervision, but it has been agreed that with modern developments in communications it is no longer necessary that this be exercised through a representative on the spot, and the remaining functions of the High Commissioner are to be transferred to the Secretary of State. The Chief Native Commissioner is to be irremovable without the latter's approval.

The constitution of 1923 established a legislative assembly, which at present consists of thirty members, and provided for the creation of a second chamber when the assembly should have passed a law to this effect. The Buxton Commission of 1921, on whose recommendations the constitution was based, held that the numbers of the European population from whom legislators could be drawn were at that time too small to warrant the immediate establishment of an upper house. The duration of the assembly is five years. The franchise is open to all British subjects, male and female, including natives, subject to a property qualification of £150, and an income qualification of £100. The European population represented numbers some 55,000. The admission of natives to the franchise was consistent with the spirit of the claim of Rhodes for 'equal rights for all civilized men'; but it is not in keeping with the policy of separate development for the African and European populations which is now the accepted principle in the territory.² The possibility of introducing some alternative system was discussed in the legislative assembly at every session from 1931 to 1933. In the latter year the Prime Minister (Mr. Moffat) stated that he had found the Dominions Office sympathetic to 'the arguments in favour of protecting the European people of this country from a majority of natives getting on the roll'.³ He

¹ See Chap. IX, p. 382.

² See Chap. V, pp. 130-1.

³ Southern Rhodesia, *Debates of the Legislative Assembly*, vol. xiii, no. 14, Apr. 26, 1933.

gave the number of native voters registered at that time as fifty-eight. No definite steps have yet been taken to deal with the question.

IV. THE BRITISH CROWN COLONIES

(a) *Relations with the Imperial Government*

The remainder of the British dependencies under discussion, whether their political status is that of colonies, protectorates, or mandated areas, are subject to the system known as crown colony government. The formal provisions for control by the imperial government over administration are the same in all these territories, though their effectiveness varies with the degree of representation accorded by law and practice to local communities. Some discussion on the sources of law and methods of legislation will be found in a subsequent chapter;¹ but it should be noted here that the provisions which regulate the scope of legislation or prescribe the conditions of its validity are not to be found, as in the case of India, in an imperial statute, but in the Order in Council or similar proceeding issued for each territory, by which the legislature, or, where there is no legislature, the ordinance-making authority is constituted. Practice prescribes that a legislative proposal of any importance (and in minor administrations any proposal for ordinance or regulation having the force of law) should be submitted to the Secretary of State for previous consideration; the Royal Instructions issued to a Governor require that certain prescribed classes of bills should, after passing the local legislature, be reserved for the orders of the Crown before he gives his assent; all legislation is subject to the veto of the Crown. Executive authority is vested in the Governor or equivalent authority as representative of the Crown; the provisions which regulate the use of that authority are partly laid down in formal orders from the Secretary of State, and partly prescribed by usage; they differ according to the extent and the importance of the territory concerned. Typical of such orders are those which provide that annual estimates cannot be acted upon until they have the approval of the Secretary of State, that no public work of any importance may be proposed to the legislature and no loan raised

¹ See Chap. VII, pp. 267-80.

without his approval, and that no additions can be made to the permanent services without his consent.

Unlike the other imperial powers Great Britain has no permanent general council to advise the government on colonial matters. The Secretary of State for the Colonies has, however, expert advisers on agriculture, colonial accounts, economics and finance, education, health and medicine, labour problems¹ and law. He is also advised by a number of committees through which the assistance of experts on various colonial problems is made available to the Colonial Office; typical of these committees are the Colonial Advisory Council of Agriculture and Animal Health,² the Colonial Development Advisory Committee, constituted in 1929 to advise on the disposal of the Colonial Development Fund, the Colonial Advisory Medical Committee,³ and the Advisory Committee on Education in the Colonies.⁴ The Colonial Office has also available to it the proceedings of the committees of the Economic Advisory Council which deal with tsetse fly, nutrition in the Colonial Empire, and locust control. There is, in addition, a large number of official interdepartmental committees and of non-official bodies on which the Colonial Office is represented. Among such bodies may be mentioned, as examples, the Imperial Institute, the Committee of the Imperial Forestry Institute, that of the Imperial College of Tropical Agriculture, and the Standing Committee on Empire Forestry.

Unlike the Colonial Ministry in France,⁵ the Secretary of State maintains no inspectorate to report on the proceedings of the administration. He remains in direct communication with the Governors, but in addition an annual report on administration is submitted by the government of each territory; this, unlike the reports received in Paris, is regularly published in London. Copies of the fuller reports of the separate departments, the proceedings of the legislative council, and the Blue Books containing statistics, as well as reports of special inquiries held, which are printed at the local capitals, are also generally published. In recent years these sources of information have been supplemented by numerous visits paid to Africa by ministers, advisers, and officers of the

¹ *The Times*, Feb. 23, 1938. ² See Chap. XIII, p. 955. ³ See Chap. XVII, p. 1159.

⁴ See Chap. XVIII, p. 1229.

⁵ See below, pp. 188-9.

Colonial Office. Many higher officials in the Colonial Office have had administrative service in the colonies, and assistants appointed to the Office must now serve there for two years. A considerable number of special commissions has been appointed to report on various aspects of colonial administration; indeed the method of the special commission, frequently containing non-official members, has been much more freely used by the British than by other countries. Direct contact with the Colonial Office has also at times been established by the visit of deputations, both European and African. The earliest deputation of Africans to be received in London was probably that of the Bechuanaland chiefs in 1895.¹ Some Gold Coast chiefs visited London in 1898 and a Gold Coast deputation again visited London in 1934; European, Indian, and African delegations from Kenya, Uganda, and Tanganyika gave evidence before the Joint Select Committee on Closer Union in 1931. Another organ of contact is the Colonial Office Conference at which the heads of colonial governments and their representatives meet in London. Two such conferences have been held in 1927 and 1930.

In the colonies and protectorates the British tradition has, as already remarked, been to secure legislation, wherever possible, through the institution of a legislative council. The presence of a considerable European population, as in Kenya and to a minor extent in Northern Rhodesia, has made some measure of representation necessary in dealing with legislation; if in other areas, where the European element is less prominent, a legislature has been established, it has been rather with the aim of securing a full and public discussion of legislative proposals than of giving at this stage effective political authority to Africans. The system has, however, been widely varied to suit the circumstances of different territories; in some cases the council is composed entirely of nominated members; in others the electorate is combined with the nominative system; in some cases representation of native interests is secured through the nomination of a European, while in others they are directly represented. It is the practice to retain a majority of official members so that any government measure which is thought to be essential can be sure of adoption. In the

¹ See Chap. IX, p. 406.

succeeding pages, which give some account of the composition of the legislature in each area, mention is also made of the composition of the executive council. The latter is a body, originally purely official in composition, which acts as adviser to the Governor; it formed in most cases the nucleus of the first legislative council.

(b) *The Composition of the Legislative and Executive Councils*

The High Commission Territories. In Basutoland, the Bechuanaland Protectorate, and Swaziland, the High Commissioner legislates by proclamation. The practice by which in Basutoland measures affecting the authority of the native chiefs have not been introduced without the consent of the national council will be discussed in connexion with native administration.¹ In the other two territories elected councils of Europeans were created in 1920 and 1921 for the purpose of advising the Resident, who is the High Commissioner's local representative; the influence of these councils on legislation is confined to requests to the High Commissioner to take action.

Nyasaland. Of the East African legislatures, those of Nyasaland, Tanganyika, and Uganda contain no elective element. The Nyasaland Order in Council of 1907 established a legislative council consisting of the Chief Secretary, Treasurer, Attorney-General, and Senior Provincial Commissioner (who form the executive council) with four nominated members who hold office for three years. It is the practice to include among the nominated members a missionary who is in a position to represent native interests.

Uganda. In Uganda executive and legislative councils were established in 1921. The executive council consists of the Chief Secretary, Attorney-General, Treasurer, Directors of Medical Services, Agriculture and Education, the Provincial Commissioner, Buganda Province, and one personally appointed official member. In the legislative council all these are *ex officio* members except the Provincial Commissioner, Buganda, and there are four unofficial members nominated for a period of three years: the practice is to appoint two Europeans and two Indians.

Tanganyika. In Tanganyika the executive council as constituted

¹ See Chap. IX, p. 394.

in 1920 consisted of the Chief Secretary, Attorney-General, Treasurer, and Director of Medical and Sanitary Services. The Director of Education and Secretary for Native Affairs were added in 1926, when a legislative council was constituted. In this body there are thirteen *ex officio* official members and ten nominated unofficial members, of whom in practice two normally represent the Indian community. Members of the legislative council are required to take the oath of allegiance to the King.¹ In view of the fact that the territory is held under mandate, this rule has aroused some discussion, though it is difficult to see what other authority could properly be substituted for the purpose of the oath. As a consequence, however, only British subjects are eligible, a fact which has caused some dissatisfaction in a territory where the British population numbers some 4,000 and the German 3,000. It is contemplated that a proportion of seats will be reserved for Africans when suitable persons become available.²

Kenya. The first legislative council of Kenya, constituted in 1907, had six official and two nominated unofficial members, the number being subsequently increased to four. A claim for elective representation was put forward by the settler community in 1913, and the consent of the imperial government to this change was announced in 1916. An ordinance passed in 1919, when the European population numbered about 9,000, divided the territory into eleven electoral areas for purposes of representation in the council, the official membership being increased in order to preserve the official majority. This ordinance in its final form made no provision for Indian representation, and Lord Milner's dispatch of 1920 issued instructions that the council should in addition to eleven elected members contain two Indian members elected on a communal franchise, that is, by the Indian population as a group.

At this point the question of the Indian franchise became a matter of acute controversy, in which pressure of opinion in India forced the government of India to take a part. The Indian community³, which at the census of 1921 numbered 22,822, contended for representation on equal terms with Europeans; the

¹ Tanganyika (Legislative Council) Order in Council, 1926.

² *Handbook of Tanganyika Territory*, 1930, p. 115. ³ See Chap. VIII, pp. 335-40.

government of India protested against the proposal to institute a communal franchise;¹ and a deputation visited London on the Indians' behalf. The matter was in some measure complicated by the fact that the Imperial Conference of 1921 had passed a resolution in favour of the removal of Indian disabilities in the dominions. The British government finally accepted the Wood-Winterton proposals, based on an agreement between the Colonial Office and the India Office, for a common electoral roll with property or education qualifications so devised as to give an Indian electorate limited to 10 per cent. of the total voters, coupled with freedom of immigration for Indians. The opposition of the settlers to this proposal, which they interpreted as involving their eventual displacement by Indian competition, was carried to the point of threatening armed resistance, and Lord Delamere headed a deputation to London to put their point of view to the Secretary of State; it is of interest to note that a deputation proceeded also to South Africa. The White Paper of 1923, to which reference has already been made,² when dealing with the question of franchise, adopted a measure of compromise between the two claims. It considered that if Indians voted on a common electoral roll it would lead to elections being fought on racial lines; it decided therefore to return to election on a communal roll, but raised the number of Indian members to 5. The new constitution of the legislative council became operative by Royal Instructions dated March 28, 1927. The official membership consists of eleven *ex officio* members and nine nominated members. Of these one normally represents Arab interests, and it is provided that in the absence of such an appointment an unofficial member is to be added for that purpose. The unofficial membership of eleven elected Europeans was increased by the addition of five elected Indians and one elected Arab member, with one nominated member, who up till now has been a missionary, to represent African interests. The Governor was empowered if necessary to fill the Indian seats by nomination; up till 1931 the Indian community expressed their dissatisfaction by boycotting the elections, and in that year they reversed their policy only to the extent that they elected representatives pledged to take

¹ *Despatch on Position of Indians in East Africa*, Cmd. 1311, 1921.

² See Chap. V, pp. 135-6.

no part in the council until the introduction of the common roll.¹ In 1934, however, they abandoned this policy of non-co-operation.

Both the European and Indian communities have adult suffrage. In the case of Arabs the franchise is limited to males able to write Arabic or Swahili in Arabic characters. Elections are held every four years. At the last census the European population numbered 16,812, Indians 39,644, and Arabs 12,166.

The executive council as originally constituted in 1905 was purely official. When the elective principle was introduced in the legislative council in 1919 provision was at the same time made for the inclusion of two unofficial members of this body, nominated by the Governor, in the executive council; their number was subsequently increased to four by the addition of an Indian member and of a European member nominated to represent native interests, while there are eight official members. It is now the practice to nominate as representatives of European opinion the leader of the elected members in the legislative council and one of the members for Nairobi. The nominated members are under no obligation to support the government and in fact frequently oppose it in the legislative council.² The presence in the executive council, the proceedings of which are confidential, of a member who may be elected to the legislature as a professed opponent of government policy, is a peculiarity which is confined to the constitution of Kenya.

It has been the practice in Kenya to consult unofficial opinion much more than a narrow interpretation of the constitution would require. From its formation in 1911 the organization known as the Convention of Associations, formed by Lord Delamere, received a consideration which earned for it the description of 'an unofficial Parliament'. The precedent of the appointment of a commission of inquiry with a majority of unofficial members was set as long ago as 1922, when an economic and finance committee was set up to recommend a general programme of economic policy. Later examples are the economic development committee of 1934, and that appointed in 1933 to review the

working of the Resident Native Labourers Ordinance. A standing finance committee of the council, with an unofficial majority, was created in 1926; the Native Lands Trust Board created in 1930, whose approval is required for alienations of native land, consists of six official and four unofficial members. The Agricultural Advisory Board, the creation of which was recommended by Sir Daniel Hall's Commission in 1929, consists of three official and seven unofficial members.

The European community, however, and in particular that section which represents the settler element, has from the first been dissatisfied with the opportunity for control over the affairs of the territory which the crown colony system permits to it. The demand for complete self-government was made by Lord Delamere as long ago as 1913, in a speech to the Convention of Associations,¹ and it will be recalled that it was this claim which called forth the general declaration of policy embodied in the White Paper of 1923. His Majesty's Government then made it clear that they were not prepared to 'delegate or share the trust' which they exercised on behalf of the native races.² In 1926 the eleven elected members of the council were returned on a pledge to press for a European elected majority. The demand for relaxation of imperial control has also been put forward at a series of inter-territorial conferences of representatives of the European communities, the first of which was convened in 1925. Kenya, Tanganyika, Nyasaland, and Northern Rhodesia have been represented at these conferences. In the proposals for a federation of the three East African territories which he submitted to the Secretary of State in 1927, Sir Edward Grigg, the Governor, recommended an unofficial majority composed partly of elected representatives of the European community, and partly of members nominated to represent native interests.

As a result of discussions between the Secretary of State and the governors of several East African territories which were held in London in 1927, principles were agreed on regarding future developments in these territories which included, on the one hand, closer co-operation in their administration,³ and on the other, the

³ See below, p. 182.

provision 'for increasing association of the immigrant communities in the responsibilities of government, and at the same time for the creation of more effective machinery for native representation'.¹ At the same time the statement already made in 1923, that 'responsible government is not in question', was reaffirmed. A commission appointed to make recommendations on these lines, with Sir E. Hilton Young as chairman, visited East Africa in 1927-8. This commission held that the European community could reasonably claim the right to effective representation in matters affecting taxation to be imposed upon them, protection against measures which would fundamentally change the economic conditions on the basis of which they settled in the country, a right to consultation on all governmental questions, and an opportunity for political self-expression such as could enable them to stimulate efficiency in the public services. They insisted, however, that 'what the immigrant communities may justly claim is partnership, not control'² and that until the native population was able to take part in a representative system the imperial government must retain, as their trustee, 'a right to intervene in all the business of government';³ further, they held that the differences of outlook between African and European which must persist, to whatever stage of development the African community may attain, would make it necessary for the imperial government permanently to retain the function of an arbiter between the two communities.

The majority of the commission recommended a somewhat complex constitution which need not be discussed in detail, since it was decided not to introduce it. The imperial government, though holding that 'the goal of constitutional evolution, in Kenya as elsewhere, is admittedly responsible government by a ministry representing an electorate in which every section of the population finds an effective and adequate voice', took the view that for the present the constitution of the Kenya legislature should remain substantially unchanged, with the exception that the nominated representatives of African interests be increased from one to two,⁴ and this was done in 1934. Again, the Joint Select Committee of

¹ *Future Policy in regard to Eastern Africa*, Cmd. 2904, 1927, p. 5.

³ *Ibid.*, pp. 83-4.

⁴ *Statement of Conclusions of H.M. Government as regards Closer Union in East Africa*, Cmd. 3574, 1930, pp. 7-8.

both Houses of Parliament appointed in 1931 to consider the whole question of closer union took the view that an unofficial majority, even with the safeguards recommended by the Hilton Young Commission, 'does morally and in fact become responsible government'.¹

The attention of the European community would seem of recent years to be directed less to the attainment of responsible government than to the extension of their influence within the limits of the existing system. In December 1936 the elected members of the standing finance committee agreed to recommend the acceptance of a light income tax² on condition that the Secretary of State instructed the Governor to examine the reconstitution of the executive council with this end in view. This proposal was accepted subject to the ultimate constitutional responsibility of the imperial government,³ and in August 1937 the nature of the proposed reconstruction was announced. The present eight official members were to be reduced to four, the unofficial members remaining the same, but holding office for a fixed period of four years.⁴

It remains to note the nature of the discussions on the Indian franchise subsequent to 1927. As already stated, the alternatives discussed were a common roll with property and education qualifications and a communal roll with adult suffrage. The Hilton Young Commission was divided on this point.⁵ The imperial government expressed itself in favour of a common roll.⁶ The Joint Select Committee took the view that, whereas the introduction of a common roll is impracticable for the present, the question should be re-examined in the event of future changes in the constitution; but that an increase in the present representation of Asiatics on the legislative council might with advantage be considered.⁷

As regards the representation of native interests the Hilton Young Commission held that for the present 'some degree of

⁷ *Report*, op. cit., p. 42.

political segregation' should be maintained; they recommended that it should be made the regular practice to consult native opinion on proposed legislation through the existing native administrations, and suggested as a possible future development the creation of local councils of a more formal nature, which might ultimately be represented jointly with the other races on a central legislative council in which the imperial government would hold the balance.¹ These proposals were endorsed by the Joint Select Committee, which, however, emphasized the point that special provision may be necessary for the 'detrribalized' native.²

Northern Rhodesia. In Northern Rhodesia the executive council consists of five senior officials, and the legislative council of these and four other nominated officials with the addition of elected unofficial members, the number of whom was increased from five to seven in 1929. The franchise qualification is occupation of property of the value of £250, income of £200, or ownership of property of the value of £2,000. A voter must be a British subject, be able to write, and must not live a communal or tribal life; this provision appears to envisage the acquisition of the franchise by educated natives, but for this purpose some revision of the qualification would be required, since Northern Rhodesia is a protectorate and the natives have not the status of British subjects.³

Provision is made, as in Kenya, for the appointment of unofficial members of the executive council, but no such step has been taken. The unofficial community, however, has demanded 'effective responsibility for the government of the country', one of its leading representatives basing the demand on the argument that the duty of trusteeship for the native peoples has not been carried out in such a manner as to justify the claim that responsibility for their interests must remain in the hands of the existing government.⁴ The association of unofficial opinion in the control of policy has in fact been pursued along the lines which have been described in Kenya. The practice of referring legislation to select committees with an unofficial majority was inaugurated in 1929. Unofficial members serve on the various advisory boards and are represented

at the annual conference of provincial commissioners. In 1937 a standing finance committee was created, which includes two officials and two elected members.¹ Shortly afterwards the Secretary of State approved a proposal that the official and unofficial membership of the legislative council be equalized by the removal of one official member and the introduction of an unofficial member nominated to represent native interests.²

West Africa: Nigeria and the British Cameroons. Each of the four British West African territories, Nigeria, the Gold Coast, Sierra Leone, and the Gambia, is divided into a colony comprising the coastal region in which European influences have been established for a considerable time, and a protectorate covering the hinterland. On this division is usually based a dual legislative system. The Governor legislates by proclamation for the more backward areas, and by ordinances enacted with the advice of a legislative council for the coastal regions. All these councils are marked by the presence of a considerable number of African representatives.

In Nigeria the sphere of the legislative council covers both the Colony and the Southern Provinces of the protectorate, only the Northern Provinces remaining subject to legislation by proclamation. The mandated territory of the Cameroons is divided into northern and southern provinces, which are assimilated for administrative purposes to the Northern and Southern Provinces of Nigeria. The executive council in Nigeria consists of the Chief Secretary, Chief Commissioners of the Northern and Southern Provinces, Attorney-General, Commandant of the Nigeria Regiment, and Medical Director, all of whom are *ex officio* members, with the Director of Education as an appointed member. The legislative council, which was inaugurated in its present form in 1923,³ consists of not more than thirty official members, of whom three are nominated and the remaining twenty-seven *ex officio*. Four unofficial members, three from Lagos and one from Calabar, are elected and up to fifteen nominated: both election and nomination are open to Africans. The property

³ Order in Council, Nov. 21, 1922.

qualification for the franchise is an income of at least £100. The nominated members include nominees of the four Chambers of Commerce and the banking and shipping interests, who are European; of the African nominated members one represents the Niger African traders and the others are selected as representatives of districts of the Colony and Southern Provinces which have not received the franchise.

The Gold Coast and British Togoland. The Gold Coast is divided into three sections: the Gold Coast Colony, Ashanti, and the Northern Territories; the southern section of the mandated territory of Togoland is included for administrative purposes in the Colony, and the northern section in the Northern Territories. The Governor is empowered to legislate by proclamation for Ashanti, the Northern Territories, and Togoland; in legislating for the Colony he has the advice of a legislative council.

The executive and legislative councils in their present form were constituted in 1925. The former consists of the holders of five official posts; in the latter there are, in addition to these officers, ten other official members; the unofficial members fall into three classes, provincial and municipal African members and European members. The six provincial African members are elected by councils of head chiefs; there is one council in each of the three provinces, though that of the Eastern Province is divided into three sections, each of which elects a member. The Central Province has two representatives and the Western, one. Each member of the provincial council has one vote for every ten thousand inhabitants in his division. The Governor is empowered to nominate provincial members, a provision which was necessary on the first introduction of the new system owing to the opposition of chiefs who feared that it would result in a curtailment of their powers. Three African municipal members are elected by the towns of Accra, Cape Coast, and Sekondi, the franchise qualification being occupation of a house of the rateable value of £6. Of the five European members one is elected by a committee nominated by recognized chambers of commerce; one is at present nominated by the Governor to represent mining interests, but legislation provides for his election by the chamber of mines at the request of the chamber. The other three are nominated.

Sierra Leone. In Sierra Leone the legislative council may pass measures applicable to the whole territory. It consists of the members of the executive council (five senior officials), with six other government officers and ten unofficial members. Three of the latter are elected to represent the Colony, which is divided for this purpose into an urban district with two members and a rural district with one. The franchise qualification is property worth £6 or an income of £60 in the rural district, property worth £10 or an income of £100 in the urban district. The remaining unofficial members are nominated. Three are paramount chiefs, two are Africans selected to represent African interests, one European represents general European interests, and the remaining member is a European appointed after consultation with the Chamber of Commerce. The unofficial members hold their seats for five years.

The Gambia. In the Gambia the legislative council for the Colony consists of six official members, and four nominated unofficial members.

V. RE-GROUPING OF ADMINISTRATIVE UNITS

Before proceeding to deal with the French and Belgian systems, it is convenient to give some account of the proposals which have been made from time to time for the re-grouping of certain units in the British areas. The issues at stake have been primarily political; the discussions have in more than one instance turned on differing views held of native policy, or have involved a comparison of the merits of crown colony and other forms of government. The schemes which have attracted most general attention are those relating to the incorporation within the Union of the three High Commission territories of Swaziland, Basutoland, and Bechuanaland, the integration into the Union of the mandated territory of South-West Africa, the co-ordination of the administrative services of the Rhodesias, which might possibly be extended to Nyasaland, and the scheme for the union of the three territories of Kenya, Uganda, and Tanganyika.

When the constitution of the Union was discussed by the National Convention of 1908-9, the Secretary of State said that it would be practically impossible to secure the consent of Parliament

to any constitution which did not include safeguards for native interests in the High Commission Territories.¹ It was agreed to retain for the time being the existing system of administration through the High Commissioner, while providing for the future transfer to the Union on terms set out in the schedule to the South Africa Act. These included the provision that the revenues derived from each territory were to be expended in it, that no differential duties should be imposed, and that no native lands should be alienated. On transfer the territories were to retain their separate existence, and to be administered by a permanent commission under the Prime Minister, the legislative authority being not the Union Parliament but the Governor-General in Council. Legislation affecting the schedule was to be reserved for the approval of the Crown. An agreement of 1910 provided that the territories should be treated as part of the Union for customs purposes, each receiving a fixed proportion of the revenues collected. This has not, however, prevented the exclusion from the Union of cattle under a certain weight from Swaziland and Bechuanaland, stated to be on veterinary grounds, and the treatment of Swaziland as an export area for purposes of the export of maize from the Union.² It may be noted that Union currency is used in all three territories; transport, in so far as it exists, has been provided by the Union, which manages the postal services.

The Union has invited the British government to consider the question of transfer on a number of occasions, the first being in 1925, when they were told that 'certain obligations' made it impossible at the moment.³ The question was raised at the time of the London Economic Conference of 1933, and in April 1934 General Hertzog announced his intention of inviting Great Britain to consider an early transfer. The position of the British government was stated in a memorandum drawn up in agreement between General Hertzog and Mr. J. H. Thomas, and made public in the House of Commons on June 20, 1935. The British government is pledged to Parliament that no transfer shall take place until the inhabitants of the territories, native as

¹ *Cambridge History*, op. cit., p. 639; M. Perham and L. Curtis, *The Protectorates of South Africa*, 1935.

² See Chap. XX, pp. 1408-9.

³ *The Round Table*, vol. xxiv, 1933-4, p. 785.

well as European, have been consulted, and Parliament has had an opportunity of expressing an opinion; it believed that native opinion was at the time strongly opposed to transfer. It noted also that the schedule to the South Africa Act required re-examination in the light of recent constitutional developments (i.e. the passing of the Status Act with its assertion of the independence of South Africa from imperial control). 'The policy of both Governments for the next few years should be directed to bringing about a situation in which, if transfer were to become a matter of practical politics, it could be effected with the full acquiescence of the populations concerned.' To this end the closest co-operation should be established between the governments of the two territories, and any proposals made by the Union for practical steps in this direction would be welcomed in Great Britain.¹

In 1936 an item of £35,000 was included in the native affairs estimates of the Union for development in the High Commission Territories, a step which General Hertzog defended on the ground of their impending transfer.² The offer was not accepted by the High Commissioner because of native opposition, especially in Basutoland; and in 1937 General Hertzog in expressing his disappointment at the attitude of the British Government said: 'The Union's right to the transfer of the administrations of the territories is indisputable. That the time for their transfer to the Union has already expired was conceded two years ago.'³

In March 1938, Mr. MacDonald announced that an agreement had been reached for giving effect to the programme laid down in 1935. It had been decided to constitute a standing joint advisory conference consisting of the Secretary for Native Affairs and two other officers of the Union together with the Resident Commissioners of the three High Commission Territories. The function of the conference will be to study openings for co-operation between the Union Government and the administrations in matters affecting the development of the territories and to consider any matters of joint concern to the Union and the territories.⁴ Meanwhile until the transfer of the territories can be effected the

¹ *High Commission Territories in South Africa*, Cmd. 4948, 1935.

² *The Times*, June 12, 1936.

³ *The Times*, July 7, 1937.

⁴ *Parliamentary Debates, House of Commons*, Mar. 29, 1938, c. 1813.

responsibility for their administration remains of course with the British government, but the agreement further provides for the Union government to prepare memoranda setting forth the proposed terms on which they contemplate that the transfer should take place. These are to be made available for the information of the native and European inhabitants of the territories.

The demand made by the Union has attracted much public attention in Great Britain. It has not failed to arouse opposition from those who are critical of the traditional attitude of the Union on native policy. The transferred territories would in their opinion be used to facilitate the application of the policy of segregation; it is argued that the natives of the territories generally, and in especial those of Basutoland, would regard transfer as a breach of an old-established understanding between them and the British.¹ The British cabinet appear for their part to have been influenced by three considerations. The first is that the principle of transfer could not be said to be at stake; article 151 of the South Africa Act and the appended schedule constitute an undertaking to transfer the territories, though at a date remaining to be fixed. To confine effort to the mere attempt to postpone indefinitely the date of transfer is disingenuous, the more so as the economic existence of the territories is bound up with the Union. The real difficulty lies in the third point, the reluctance of the natives. The pledge given to Parliament in 1935 does not imply that the formal assent of the natives is a necessary condition to transfer; but a far greater measure of goodwill is required on their part than exists at present; every argument therefore is in favour of establishing at an early date the machinery which may assist to produce that goodwill. It may perhaps be added that the task of those who oppose the transfer might have been easier if it could have been shown that the British government had made more active attempts in the past to improve the material condition of the territories; the facts given elsewhere² show, however,

¹ See Chap. IX, pp. 394-400; M. Perham and L. Curtis, *op. cit.*, pp. 4, 99-104; Statement by the Rt. Hon. J. H. Thomas, *Parliamentary Debates, House of Commons*, vol. ccciii, 1934-5, c. 593-7; 'Memorandum prepared by the Parliamentary Committee for studying the position of the South African Protectorates', Supplement to the *Journal of the African Society*, vol. xxxiii, no. cxxxiii, 1934, p. 5.

² See Chap. IX, pp. 393-413.

that it is only since the question of transfer has come to the fore that they have made any serious effort to do so.

The political future of South-West Africa has been a matter of discussion almost from the date of the acceptance of the mandate by the Union. A commission appointed in 1921 to make recommendations as to the form of government to be introduced took the view that the provision of the League Covenant for its administration 'as an integral part' of the territory of the mandatory excluded any question of ultimate independence.¹ The administrative system of the territory has been closely assimilated to that of the Union. Roman-Dutch law as amended by Cape legislation up to 1920 has been proclaimed the common law of the country, though German law remains in force where it is not inconsistent with this system. The judicial system is organized in the same way as in the Union, and the Union law of insolvency, registration of deeds, land settlement and administration of estates has been proclaimed.² The railways and harbours of South-West Africa and the Union are administered as a single system. The territory is included within the Union for customs purposes, and can only raise loans in the Union.

Discontent with the existing system, which was held to subordinate the economic interests of the territory to those of the Union, led to the adoption by the assembly in 1932 of a resolution demanding the delegation to it of the powers reserved in the South-West Africa Act,³ and certain other additions to its competence.⁴ The Union government agreed to pass the necessary legislation, but before this could be done the situation was altered by the advent to power of the National-Socialist party in Germany and the intensification of German nationalist activities in the territory. The reaction of the British section of the population to this development was a movement for the incorporation of South-West Africa in the Union as a fifth province.⁵ Under an amendment to the criminal law introduced in 1933,⁶ the local German National-

⁶ Ordinance 13 of 1933.

Socialist organization was suppressed in October 1934, and the German members then resigned from the assembly and advisory council. The assembly elected in 1934 adopted a resolution in favour of the administration of the territory as an integral part of the Union, either in the form of a fifth province or otherwise.¹ The Union government then appointed a commission to inquire into the reasons for dissatisfaction with the existing form of government and recommend measures of improvement. Its members could not agree upon a new constitution, one favouring incorporation as a province of the Union, one administration on the lines foreshadowed for the High Commission Territories in the schedule to the Act of Union,² and the third a compromise in which the European community would have certain powers of local government, while the administration of native affairs, land settlement, mining, justice, and police would be in the hands of the relevant Union departments. In reporting on the question to the League of Nations, the Union government, upon whose resources a province deeply in debt would be a heavy burden, expressed the opinion that sufficient grounds did not exist for an alteration of the present constitution.³ It added that it had as little thought of abandoning the mandate as it had of abandoning its own territory. Whether the terms of the mandate would permit of South-West Africa's being administered as a fifth province of the Union presents a legal issue which has not yet been fully explored either by the Union or by the Permanent Mandates Commission.

Southern Rhodesia sent delegates to the National Convention which drew up the Act of Union, and entered into a customs union with South Africa; the Act itself made provision for possible amalgamation with the Union. As already remarked, when the question of granting responsible government to the territory was considered, amalgamation with the Union was regarded as the only alternative.⁴ The arguments in favour of incorporation are by no means negligible. Southern Rhodesia was colonized largely from the south. It has adopted the Roman-Dutch law, and appeals from the local courts lie to those of the Union. The rail-

¹ *Report of South-West Africa Commission*, U.G. 26, 1936, p. 14.

⁴ See above, p. 157.

way system is continuous with that of the Union, and the line as far as Bulawayo is managed from South Africa; the Union is an important market for Rhodesian produce. Nevertheless, entry into the Union was strongly opposed in 1922, when, in spite of the favourable financial terms offered by the Union, the referendum showed a majority of 2,780 in favour of responsible government. It is still opposed by a considerable section of opinion which is anxious to preserve the predominantly Anglo-Saxon character of Southern Rhodesia where, at the census of 1936, 96½ per cent. of the white inhabitants were of United Kingdom origin. This population has no sympathy with the separatist movement in the Union, and does not wish to accept the bilingualism which membership of the Union would involve; it fears, again, that the crown land of Southern Rhodesia might be used for the settlement of 'poor whites' from the Union.¹ The advantages of inclusion in the customs union soon began to prove illusory. In 1924 the Union prohibited the import of Rhodesian meat and scrap tobacco; in 1930 a quota was enforced on all Rhodesian tobaccos, and a conference at Pretoria agreed that each government should frame its own tariff;² in 1934 Southern Rhodesia denounced the customs convention. On the Union side realization that the incorporation of Southern Rhodesia would reopen Union markets to the competition which they have thus excluded provides a strong argument against such a step; it is probable indeed that a renewal of the proposal might encounter in the Union views materially different from those of 1922.

Of recent years the development of copper-mining in Northern Rhodesia has brought to that territory a considerable European population who are now seeking a larger share of self-government and believe that this could best be attained through the union of the two Rhodesias. The first suggestion of this was made in 1915, when Sir Starr Jameson visited the two Rhodesias in the hope of securing popular support for their unification. At that time, however, the small white population of Northern Rhodesia were reluctant to accept the domination of the much larger European community to the south, while the latter were equally apprehensive of the burden on their resources of amalgamation with a

¹ *The Round Table*, vol. xii, 1921-2, pp. 208-9. ² *Ibid.*, vol. xxv, 1934-5, p. 625.

territory as yet undeveloped.¹ The Commission of 1927 on Closer Union of the Dependencies in Eastern and Central Africa² took the view that Northern Rhodesia and Nyasaland, even taken together, formed an economic unit too small to justify the establishment of a separate government such as they recommended for Tanganyika, Kenya, and Uganda. They discussed a number of alternative possibilities including both association with the northern group and federation or amalgamation with Southern Rhodesia. In their view, however, it was as yet early to impose fresh responsibilities on the government of Southern Rhodesia, while it was still an open question whether the territory to the north of the Zambesi could be regarded as a 'white man's country' in the same sense as that to the south.³ On the publication of the Commission's report in 1929 the Prime Minister of Southern Rhodesia issued a memorandum which laid stress on the close connexion between the two Rhodesias and protested against recommendations 'likely to lead to the eventual absorption of Northern Rhodesia into the Eastern African system'. The assertion in the Passfield White Paper of 1930 of the paramountcy of native interests, although it repeated word for word the terms of the White Paper of 1923,⁴ aroused anxiety among the local European population, and gave impetus to a movement from the north in favour of amalgamation with Southern Rhodesia as the only means by which the small European communities of Northern Rhodesia and Nyasaland could hope to achieve responsible government. In 1931 joint representations were made to the Secretary of State by the Southern Rhodesian government and the elected members of the Northern Rhodesian legislature, asking that a conference be held to discuss the possibility of amalgamation. Mr. J. H. Thomas replied that 'His Majesty's Government, while considering that amalgamation is not practicable now or in the near future, do not wish to reject the idea in principle. . . . The conditions of any scheme of amalgamation . . . must make a definite provision for the welfare and development of the native population.'⁵

In 1936 the demand for amalgamation had the support of

¹ *The Times*, May 29, 1936.

³ *Report*, op. cit., p. 285.

⁴ See Chap. V, pp. 135-6.

⁵ *Parliamentary Debates, House of Commons*, vol. ccliv, 1930-1, c. 1472.

all the Southern Rhodesian parties, and six out of seven of the elected members in Northern Rhodesia; a conference held at Victoria Falls agreed upon the terms of amalgamation to be submitted to the imperial government.¹ The reply made was that there had not been such a material change in conditions as would justify a reconsideration of the decision of 1931. In 1937, however, further representations were made in London on behalf of both territories, and as a result the appointment of a Royal Commission to inquire into the possibility of some form of 'closer co-operation or association' between the Rhodesias and Nyasaland was announced.² It is relevant to recall that the European population of Northern Rhodesia was, in 1935-6, 9,913 against 55,419 in Southern Rhodesia. Though the resources of the former territory have lately improved, the recent report³ by Sir Alan Pim points to the great leeway which has to be made up in its social services. But the main obstacle to federation appears to lie in the existence of large native areas, such as Barotse⁴ province, which call for special treatment.

After the British occupation of Tanganyika, proposals for a federation which would include Kenya, Uganda, Tanganyika, Nyasaland, Northern Rhodesia, and Zanzibar were published by Sir Harry Johnston and other writers. A reference by Mr. Amery, when Secretary of State in 1926, to 'the ideal of a united East Africa' may be regarded as the only pronouncement by a minister of the Crown in favour of such a development in the near future.⁵ It is open to doubt whether the creation of a self-governing dominion would be compatible with the maintenance of the obligations undertaken by Great Britain as mandatory for Tanganyika, but the mandate authorizes union with neighbouring territories on certain conditions.⁶ In 1924, following a motion in Parliament for the appointment of a commission to report on the co-ordination of policy and administration in the territories, a commission, with Mr. Ormsby-Gore as chairman, spent three months travelling through Nyasaland, Kenya, Uganda, and

Tanganyika. The commissioners were not instructed to make any proposals for federation,¹ but they did sound local opinion on the question, and reported that they found little support for the idea, and definite hostility from various quarters, including the European community in Kenya, the native government in Buganda, various Indian associations, and all shades of opinion in Zanzibar. They rejected the idea of federation on its merits, on the grounds that lack of communications would be a serious obstacle and that federal government would be cumbrous. They recommended, however, a series of inter-territorial conferences at regular intervals at which all six dependencies should be represented. Matters of general policy which presented common problems, such as native administration, communications, taxation, land and labour policy, should be discussed at a conference of governors. Conferences of educational and agricultural officers were mentioned as examples of joint discussions which should be held between the heads of technical services. The first Governors' Conference was held at Nairobi in 1926 and the second in 1930.

The question of closer union was again discussed by the Secretary of State with various of the East African Governors in London in 1927. Sir Edward Grigg, Governor of Kenya, recommended the immediate establishment of centralized control of transport, communications, customs, defence, and research.² A White Paper issued after these discussions announced the appointment of a commission to inquire into the possibilities of 'closer union and co-operation', which should have in mind the ultimate federation of all six territories, though it might be found that for the present only a union of Kenya, Uganda, and Tanganyika was practicable.³ This commission, as has already been shown,⁴ visited East Africa in 1927-8 and recommended a series of steps towards an ultimate union under a Governor-General, who would have powers designed to enable him to exercise at close quarters the functions of supervision and control which are at present the responsibility of the Secretary of State.⁵ As a preliminary step a High Commissioner should be appointed for Kenya, Uganda, and

Tanganyika, whose functions would be to work out plans for the development of a unified native policy based on the principles quoted earlier,¹ the promotion of unified control of services of common interest, and the proposed modifications in the constitution of Kenya.² Sir Samuel Wilson, Permanent Under Secretary of State for the Colonies, was subsequently instructed to visit East Africa and ascertain on what lines a scheme for closer union would be administratively workable. He recommended the appointment of a High Commissioner exercising legislative and administrative control over certain major services, all other matters including native policy being left to the local legislatures.³ The Statement of Conclusions issued by Lord Passfield when Secretary of State in 1930⁴ embodied a proposal for the appointment of a High Commissioner who should both advise the Secretary of State on native policy and legislate for all three territories on certain matters of common concern to them; in legislating for these matters he would have the assistance of a council of three official and twenty-one nominated members, seven of these coming from each of the three territories.

These proposals were submitted to the consideration of a Joint Select Committee of both Houses of Parliament, which sat in 1930-1, and came to the conclusion that any far-reaching step in the direction of closer union at that time would be inopportune, on account of the increased financial cost in a time of economic depression, the reluctance of the native witnesses from Uganda and Tanganyika to be more closely associated with Kenya, the obstacles presented by inadequate communications, and the absence of any common consciousness in the populations of the territories.⁵ They recommended, however, that there should be regular conferences of the Governors of Kenya, Uganda, and Tanganyika, with periodical extraordinary conferences including the Governors of Northern Rhodesia, Nyasaland, and Zanzibar, and that a joint secretariat should be created which would serve also for inter-territorial conferences on technical subjects.⁶

⁶ *Ibid.*, pp. 16-23.

expressed in 1933 the opinion that a political or constitutional union between Tanganyika and the neighbouring territories cannot be carried out as long as the mandate is in force,¹ and has subjected to close scrutiny such measures of administrative unification as have been taken. These have so far not been numerous. The customs union between Kenya and Uganda, created in 1917, has been extended to Tanganyika,² and in 1933 the Tanganyika postal service was amalgamated with that of Kenya and Uganda, which had been established as a joint service in 1911.

Apart from these steps, co-ordination of policy has been sought by means of informal agreements, reached in the Governors' Conference, which now meets once a year. In 1934 and 1935 resolutions urging that circumstances had so changed as to render an early union of Kenya and Tanganyika desirable were passed at meetings representing European unofficial opinion in the two territories and submitted to the Secretary of State; he replied, however, that the reasons which had led the Joint Select Committee to regard such a step as premature still held good.

From the purely administrative point of view some further measure of co-ordination clearly remains desirable. Some of the difficulties based on lack of communication are rapidly being reduced. There are many evidences of overlapping or duplication of work in the technical services of these territories; in some cases not only would a single directorate secure a saving of overhead expenses, but it should ensure a more efficient use of existing resources. In a branch of work such as survey, the existence of separate establishments is almost an anomaly. The meetings of technical officers in connexion with the Governors' Conference are useful; but their resolutions have no binding force. The conflict of interests in regard to rates on the Uganda railway or the traffic of Lake Victoria illustrates the inefficacy of the existing means of co-ordination.³ It may again be doubted whether in present circumstances the charges due to the maintenance of three separate

¹ *Report, Session xxiii*, 1933, p. 189.

² On Jan. 1, 1923, Kenya and Uganda on the one hand, and Tanganyika on the other, adopted identical tariffs; local produce of the three territories was placed upon the free list. On Aug. 1, 1927, a Customs Agreement for the free interchange of both local produce and imported goods entered into effect.

³ See Chap. XXIII, p. 1580.

governorships and their secretariats can be justified. The political issues of amalgamation, however, continue to present a problem which, if not insoluble, is of great difficulty. The Permanent Mandates Commission would appear to have shown itself somewhat unduly susceptible in its criticism of the few measures of co-ordination so far effected between Tanganyika and the other areas, and the validity of its conclusions as to the incompatibility of amalgamation with the terms of the mandate seems at least debatable. It can at the same time be readily understood that the British government does not desire, while the future of the ex-German colonies is under discussion, to take any step which may cast doubt on its aims as a mandatory power. The difficulty of any scheme of administrative union is accentuated by the position of Kenya. The co-ordination of administrative services is not feasible unless there is also a unitary control of finance; and it would only be possible to secure this by creating a constitutional authority capable of counteracting, when necessary, the influence of the European section in the Kenya legislature.

VI. THE FRENCH SYSTEM

(a) *Relations between France and the African Colonies*

The principle of devolution to local legislatures, the operation of which in the British dependencies in Africa has been described, has no parallel in the relations of the French government with its colonies. All legislation emanates in theory from the metropolis, although the details of its application must necessarily in practice be determined by local ordinances; and the formal consultation of unofficial opinion previous to legislation is largely effected in the metropolis, through parliamentary representation of the colonies and by the appointment of their delegates as members of advisory councils.

The French colonial empire resembles the British, in contrast with the Belgian and Portuguese, in having no fundamental statute defining the constitution. Under the Second Empire, the Senate was given the duty of defining by *sénatus-consulte* the status of the Colonies. The result was the *sénatus-consulte* of May 3, 1854, which gave a detailed constitution to the 'Old Colonies' (the

Antilles and Réunion), but as regards the others, provided that they should be governed by imperial decree. At some future date they were to be endowed with a constitution. The Republic did not make provision for colonial legislation in its own constitution, and has had to fall back on a juristic convention which gives a survival value to the *sénatus-consulte* of 1854, as a solitary item in the discarded imperial constitution. The President of the Republic has power to legislate for the colonies by decree, without consulting either Parliament or the *Conseil d'État*. In practice colonial decrees are issued on the advice of the Minister for the Colonies, and frequently on the recommendation of the local authorities.

Since, however, with the fall of the imperial régime the *sénatus-consulte* of 1854 lost the character of a constitutional enactment and has now only the status of a law which can be modified by parliamentary procedure, the *Chambre* has asserted its right to legislate for the colonies. It is agreed that ordinary legislation does not extend to them unless this is specially expressed in the law itself; but the *Chambre* has declared applicable to them a considerable body of metropolitan legislation dealing with matters of general principle, such as the freedom of the press and of public association.¹ It is principally in financial matters, however, that Parliament intervenes in colonial affairs. Its authorization is necessary for loans to the colonies, if a state guarantee is involved; if not, a decree of the President in Council is sufficient. Colonies in receipt of loans guaranteed by the government must submit their budgets for the approval of Parliament.² Parliamentary sanction is required for the construction of railways with any form of financial assistance from the metropolitan government.³ The right of Parliament to impose taxation on the colonies was asserted in a law of April 28, 1893,⁴ which was described as being based on the principle that all Frenchmen, whether they live in France or the colonies, are equal in matters of taxation. In accordance with this principle, a law of 1900⁵ made the colonies liable for the military expenditure incurred on their behalf by the home government, which makes itself responsible for their defence. While, however,

³ *Ibid.*, vol. ii, p. 54.

⁴ *Ibid.*, vol. ii, p. 8.

⁵ *Ibid.*, vol. ii, pp. 8-9.

the Parliament is to some extent a source of legislation, it remains the fact that the great bulk of legislation is secured by ministerial decree.

Originally subject to the control of the Minister of Marine, the colonies were transferred to the Minister of Commerce and back again on several occasions between 1881 and 1893, till finally in 1894 the growing importance of the African colonies in particular was held to necessitate the creation of a separate ministry.¹ The Colonial Minister has the assistance of an expert advisory body, the *Conseil Supérieur des Colonies*, first constituted in 1890,² completely reorganized in 1920,³ and again in 1937,⁴ with the title of *Conseil Supérieur de la France d'Outremer*. As constituted in 1920, this body was divided into three sections, the *haut conseil colonial*, an economic council, and a council on legislation. The *haut conseil colonial* consisted of former colonial ministers, former Governors-General, and representatives of the Ministers for Foreign Affairs, War, and Marine. It was abolished in 1937.

The economic council and the council on legislation are interesting in that they contain an elective element. The President and Vice-President of each are nominated by the Colonial Minister for a period of four years. The senators and deputies of colonies with parliamentary representation, and delegates specially elected from the other colonies, are members of both councils. Of these delegates four represent colonies of the West African Federation—Guinea, the Ivory Coast, Dahomey, and the French Sudan—and one delegate represents Equatorial Africa. They are elected for a period of four years by the French citizens of the territories concerned;⁵ this electorate may include natives who fulfil the requisite conditions, but it is more usual to elect a delegate resident in France than a member of the local community. The nominated members of the economic council consist of twenty-four representatives of colonial interests, ten of metropolitan interests, and the presidents of the six organizations of chambers of commerce most interested in colonial trade. The legal section advises on administrative and financial as well as legal questions,

⁴ See *L'Afrique française*, July 1937, pp. 349–52.

⁵ Decree of Jan. 23, 1929.

thus taking over some of the functions of the *haut conseil colonial*. Its nominated members are two members of the Council of State, two members of the *Cour des Comptes*, a member of the Court of Cassation, a member of the Paris Court of Appeal, and a professor of public law. These councils must meet twice a year; but the questions to be submitted to them are left to the discretion of the minister.

Specialized advisory bodies include an education committee, created in 1895, a committee on public works, dating from 1894, and a committee on requests for concessions, established in 1898; all these have been frequently reorganized. A special commission of inquiry on native affairs was appointed in 1909, and in 1913 a permanent body was established for the purpose. It consists of about sixty members, and is required to examine all reports received on native policy, and in general to advise on questions submitted to it by the minister.¹ In 1937 the creation of a body with a definite programme of study of native affairs was announced when the government decided to set up a special committee to study the aspirations and needs of the native populations.² It consists of three senators, six deputies, and twenty other persons, selected for their expert knowledge; the President is M. Guernut, a former Minister of Education.

A general conference on colonial economic questions, which was repeatedly compared to the British Imperial Conference, was held in Paris from December 1934 to January 1935.³ Its organization differed in fact both from the imperial and colonial conferences in that its membership was not confined to representatives of governments. In addition to them it included the elected representatives of the colonies in the Senate, *Chambre*, and *Conseil Supérieur des Colonies* (as it was then called), and representatives of economic interests both in France and the colonies.

It is perhaps typical of the centralizing tendency of French colonial policy that France has devised an institution for the supervision of colonial administration and the collection of information from official sources, which remains unique; this is the colonial

¹ P. Dareste, *op. cit.*, vol. i, pp. 217-18.

² *Africa*, vol. x, no. 2, 1937, p. 235.

³ See *L'Afrique française*, Dec. 1934, pp. 696 ff., May 1935, pp. 270 ff., and Aug. 1935, pp. 516 ff.

inspectorate, a separate branch of the service, the members of which are occupied exclusively in visiting the various colonies and returning to France to report.¹ The director of this service, who has his permanent office at the Colonial Ministry, is responsible for advising the minister on all measures of colonial administration for which his sanction is required.² Each colony is visited every two or three years by a 'mission' consisting of a group of members of the inspectorate; it is then for the director to convey the recommendations to the governments concerned and request action upon them. The inspectorate has considerable powers. Its members are responsible directly to the Minister for the Colonies and are thus not subject to the orders of any local authority. They are required to inspect both administrative and technical services, including the military organization, and have the right to request the assistance of any official in their work, and to be present at sessions of the local administrative councils specially convoked on their account. In order, however, to guarantee their detachment, they are strictly forbidden to issue any order, and members of this service may not be appointed, even temporarily, to any administrative position.³ Their reports are not made public.

The principal official source of published information on the colonies is the *Journaux Officiels* which publish official documents of various kinds; save of course for the mandatory areas, there is no annual report published, nor are departmental reports given to the public. Information, whether statistical or other, is therefore relatively difficult to obtain. West Africa has made a welcome departure in publishing in 1934 and 1936 two *Annuaires Statistiques*, roughly corresponding to the British Blue Books; the monthly bulletin published by the *Agence Économique de l'A.O.F.* refers mainly to trade movements.

(b) *The Territorial Organization of the African Colonies, and the powers of their Governments*

French West Africa is a federation of seven colonies each with its own Lieutenant-Governor⁴, subject to the central control of a

¹ See P. Daresté, *op. cit.*, vol. i, pp. 223-5; Decree of Nov. 25, 1887.

² A. Girault, *op. cit.*, vol. ii, pp. 233-9.

³ Decree of Apr. 1, 1921.

⁴ Now called Governor. Decree of June 14, 1937.

Governor-General. It originally consisted of eight colonies—Senegal, Sudan, Guinea, the Ivory Coast, Dahomey, Mauretania, the Niger and the Upper Volta. The last was abolished in 1932 and its territory absorbed by its neighbours. Each colony is divided into *cercles* under an *administrateur*, usually referred to as *commandant de cercle*; within a *cercle* a subdivision may be created under a *chef de sub-division*. The city of Dakar is under a special administration.

The mandated territory of Togo is not subordinate to the administration of French West Africa. It has financial autonomy, and its head has the title of Commissioner of the Republic.¹ A certain degree of unification of the higher ranks of the administrative service of Togo with that of the neighbouring territory of Dahomey was however introduced as a measure of economy.² A decree of 1934 provided that the office of Commissioner of the Republic should be held by the Lieutenant-Governor of Dahomey, while there should be a joint head for Dahomey and Togo of most of the departmental services; in 1936 a further reorganization provided that Togo should once more have its own head of the police and customs services. In 1937 the majority of the other services were similarly restored to Togo, and it was provided that the Governor-General should hold the office of High Commissioner for Togo, being represented at Lomé by an *administrateur supérieur* with the rank of *Commissaire de la République*. The territory retains its budgetary autonomy.³

The federation of Equatorial Africa was formed in 1910 from the three colonies of the Gabon, the Middle Congo, and the Ubangi-Shari; the Chad territory, attached to the Ubangi-Shari, remained under a military government till 1920, when it received the status of a separate colony. Between 1925 and 1929 the Middle Congo was under the direct administration of the Governor-General.⁴ During the years of economic depression, reductions in the cost of administration became urgent, and it was held that improvements in communications made the elaborate federal organization unnecessary. Accordingly, the territory was

¹ P. Dareste, *op. cit.*, vol. i, pp. 55, 80, 81.

² See *L'Afrique française*, Aug. 1935, pp. 494 ff.

³ *Rapport annuel du Togo*, 1937.

⁴ P. Dareste, *op. cit.*, vol. i, pp. 72-3.

reorganized in 1934 as a unit with a single budget and one secretariat at Brazzaville, the head of the administration retaining, however, the title of Governor-General, and the former colonies continuing to be recognized as separate units with the name of *régions*. A delegate of the Governor-General, having the rank of governor, is responsible for the administration of the Ubangi-Shari and Chad; a *commandant de région*, responsible to the governor at Bangi, is in charge of the latter territory, which still has something of the character of a military administration. The Gabon is made subject to the authority of an *administrateur supérieur* directly responsible to the Governor-General.¹

At the same time the administrative subdivisions were completely remodelled by the creation of twenty provinces or departments, defined on geographical, ethnic, and economic principles, with an average area of 125,000 square kilometres, the subdivisions remaining as before.² In 1936, however, it was found that the improvements in communications had not been sufficient to justify the creation of these large units; a further reorganization was accordingly made by the creation of fourteen additional units, eleven being classed as departments and two as autonomous subdivisions, while the commune of Brazzaville was separated from the province. It is also proposed that, without returning to the federal system with four separate colonial budgets, decentralization should be encouraged by separating the budgetary estimates for the four regions.³

The Cameroons were annexed to the federation in 1917, but with the introduction of the mandatory system this territory was detached from Equatorial Africa, and retains its separate status under a Commissioner of the Republic who is a member of the *conseil de gouvernement* of Equatorial Africa.⁴ It was originally subdivided into eleven *circonscriptions*, but additional units were created as the interior was brought under effective administration.⁵ There are now seventeen such divisions,

⁴ Decree of Mar. 23, 1921.

⁵ *Rapport annuel par le gouvernement français au Conseil de la Société des Nations*, 1933, p. 6.

which were given the name of *régions* in 1935, and forty-six subdivisions.¹

The powers delegated to a Governor-General have never been very precisely defined. The decrees creating the office describe him as 'the repository of the powers of the Republic' and the head of all the administrative services; as such he posts to the various colonies the officials who are appointed by the Minister. He is assumed to hold, subject to ministerial instructions, all the executive authority of the Government of the Republic. His position in regard to legislation is peculiar. The ministerial decree does not enter into force till it is promulgated by him in the local *Journal Officiel*. No general legislative powers are expressly conferred on him; but a large number of laws and decrees is passed in general terms leaving it to the Governor-General to determine the details of their application by means of rule-making *arrêtés*,² issued under his *pouvoir réglementaire*, which gives him authority to attach criminal penalties to the breach of rule. A particularly important matter which is regulated in this way is the organization of native courts. The Governors-General are also entitled by virtue of their position as heads of the police to legislate by *arrêtés* on matters as diverse as the control of navigation, sanitary regulations, military requisitions, and the control of private schools.³ They may impose taxation other than customs tariffs, subject to the approval of the Minister, and may create state monopolies. They submit the colonial budget to the Minister who, though he is able to impose conditions for his approval, must approve or reject *en bloc*. The budget must be approved by decree before coming into force.⁴

Certain legislative measures expressly stipulate that the *arrêtés* which they authorize the Governor-General to make must have the approval of the Minister, or even be approved by decree, before coming into force. The type of measures which contain this provision seems to be determined less by any general principle than by the attitude of different ministers towards the delegation of powers. Approval by the Minister does not involve any formal

¹ *Arrêté* of Apr. 8, 1935.

² P. Daresté, *op. cit.*, vol. i, p. 32.

³ *Ibid.*, vol. i, pp. 327, 678.

⁴ *Ibid.*, vol. i, p. 328.

procedure; it is sometimes regarded as implicit, and it can be given on the basis of a summary of the essential features of the legislation in question.¹ The powers of the Commissioners of the Republic in the mandated areas of Togo and the Cameroons are similar to those of Governors-General.²

It does not appear that there is any very precise definition of the powers of the Governors-General vis à vis the Lieutenant-Governors. Though it has been customary to speak of the governments of West and Equatorial Africa as 'federations', the term is not used in the sense usually assigned to it in constitutional practice. The component 'colonies' originally dealt direct with the Colonial Ministry; those in West Africa were first grouped under the Governor of Senegal in 1895 and subsequently under a Governor-General in 1904. The steps by which the federation of Equatorial Africa was created have already been described.³ But the 'federations' thus established are administrative, not political; the colonies, as such, have not been left, or endowed by statute, with any independent field of legislative or executive action. They differ therefore in an important respect from the Indian 'provinces' which at an earlier stage of their development presented some analogy to them. The circumstances which have dictated constitutional developments in India are of course entirely different from those of Africa; but it may be noted that the Indian 'province', starting as a subordinate administrative unit, has been given, as a preliminary to federation between the British Provinces and Indian States, a position which has most of the aspects of legislative and executive autonomy. In French West and Equatorial Africa, while the creation of a federation has, as was intended, effected a considerable measure of decentralization vis à vis the Colonial Ministry, the general tendency has been for the Governor-General in both areas to extend a centralizing control over the 'colonies', or at least to effect a division of functions which leaves the executive of the 'colony' a relatively small field of administrative authority. Thus in West Africa the central government has its separate treasury, into which all revenues from import duties and *taxes de consommation* are paid. Direct taxes and a trade tax recently intro-

¹ Ibid., vol. i, p. 324.

² See above, pp. 190-1.

³ Ibid., vol. i, p. 321.

duced are paid into the revenues of the separate colonies, but their yield is not sufficient to meet any extraordinary expenditure, so that they are dependent on the centre for any measures of development. In addition to the cost of its own personnel, the central government is responsible for public works of general interest and for the European courts of law throughout the federation.¹ There is a considerable central service² which is directly responsible for transport facilities affecting more than one territory and for the establishment of institutions for scientific research, but in other matters their function is to act as an inspectorate and advise the Governor-General as to the instructions to be issued to Lieutenant-Governors. The system under which sources of finance are divided, and which in effect makes the 'colony' dependent on the centre for all development expenditure, gives the Governor-General a wide control over the local budget. In general questions of policy also the main lines are determined by the central government, the Lieutenant-Governors being responsible for their execution. They are empowered to issue *arrêtés* providing for the local application of *arrêtés* of the Governor-General, but the subjects on which they are entitled to take decisions without reference to the Governor-General are confined to those specifically delegated to them by *arrêté*. Within the separate colonies administration is again highly centralized; all orders are issued by the Lieutenant-Governor on the advice of the head of the department concerned, and there is a relatively small field of discretion left to the local administrative officer.

(c) *The Three Communes and the Status of Africans as
Citizens or Subjects*

In discussing the institutions for the consultation of local opinion in the French colonies it is necessary to deal separately with the 'four communes'³ of Senegal. The 'four communes' of Saint Louis, Dakar, Gorée, and Rufisque represented the four towns from which the French extended their hold over the hinterland; they were from 1890 to 1920 described as the territory under direct administration, the remainder of Senegal being regarded as a pro-

¹ P. Daresté, *op. cit.*, vol. ii, pp. 43, 104.

² See below, pp. 236-41.

³ Now three: see below, p. 196.

tectorate. At the time of the constitution of 1848 Senegal was endowed, in accordance with the 'assimilationist' theories of that day, with the same adult male franchise which was introduced in France. The law of April 24, 1833, had already provided that all free persons should enjoy equal civil and political rights on conditions determined by law, but this latter phrase has been held from the outset to permit of exceptions to the principle of the complete assimilation of natives to French law. The impracticability of such a step has in fact always been recognized: a Moslem tribunal was established at St. Louis only a few days before the issue of the instructions of 1848 conferring the franchise upon the colonies. Whereas, however, throughout the rest of French Africa there is a clear distinction between persons subject to native customs (*sujets*) and those assimilated to European law (*citoyens*), the latter having identical civil and political rights with Europeans, the inhabitants of the four communes are legally described as *citoyens français* and enjoy the franchise by virtue of that status, though in other matters they remain subject to local Moslem law. The position as defined by legal theorists is that the government of 1848 deliberately conferred the franchise upon the native inhabitants of Senegal without intending at the same time to make them subject to French civil law.¹ They are, however, exempt from provisions of French law which apply only to natives.

The French have tended to interpret restrictively the franchise provisions relating to these communes, which are now generally felt to be unsuited to the various populations to which they have been applied. In 1906 a revision of the registers and the removal from them of names of persons not born within the 'four communes' of Senegal as it existed in 1848 was contested in the courts, which upheld the official interpretation of the law.² In 1916 a decree was passed which defined as *citoyens français* not only all persons born within the four communes but also their descendants. Although the immediate purpose of this decree was to define the persons liable to conscription, it also had the consequence of increasing the numbers eligible for the franchise. A prolonged controversy on the question whether it necessarily also made them subject to French civil law was finally decided in 1932 by the

¹ P. Dareste, *op. cit.*, vol. ii, pp. 331, 518.

² A. Girault, *op. cit.*, vol. ii, p. 571.

introduction of a special civil code for the natives of the four communes and their descendants.¹ The number of natives having the status of *citoyens* in the *circonscription* of Dakar and the colony of Senegal was 78,373 in 1936, while the total native population of these areas numbers about one and three quarter million.²

The constitution of 1848 provided for the election of twelve colonial deputies, one being allotted to Senegal, and this system, annulled under the Second Empire, was reintroduced in 1870. In 1875 provision was made for the election of senators as well as deputies by Martinique, Guadeloupe, Réunion, and the Indian colonies, but Senegal remains represented by a deputy only. It has been pointed out that there is a certain illogicality in this representation, in that the legislation for the colonies does not in the main emanate from Parliament, while the measures passed there are not applicable to the colonies unless this is expressly provided in special cases.³ Nevertheless, the colonial representation makes possible expressions of native opinion in the course of general debates on colonial questions in a way which has no parallel in the constitution of any other colonial empire. It is also not without significance that M. Blaise Diagne, the first Senegalese to be elected as deputy, was, during his long term of membership of the Chamber, on more than one occasion Under Secretary for the Colonies. The election is confined to *citoyens français* and is regulated by the French electoral law.

Local self-governing institutions were introduced in Senegal by the decree of August 10, 1872, which created the communes of St. Louis and Gorée. A commune of Rufisque was created in 1880.⁴ Dakar was separated from Gorée in 1887,⁵ and in 1929 its predominant importance led to the merging of Gorée in the commune of Dakar.⁶ The members of these councils, the *communes de plein exercice*, are elected by adult male suffrage; the mayor is elected by the council from among its members. Since 1910 the majority of the members have been Africans. The powers of these councils were originally modelled closely upon those of the communes in France. They have the right to impose rates, and

⁶ Decree of Apr. 9, 1929.

budgetary expenditure requires their approval; they are also entitled to increase the estimates. Their freedom of action in financial matters is, however, limited, as in the case of local government bodies in France, by the division of items of expenditure into obligatory and optional classes, only the latter requiring the consent of the council, a provision which enables the central authorities to insist on the maintenance of services held to be essential. The duties of local authorities in France itself are strictly limited in accordance with the centralized character of French administration; they have no responsibility for the organization of services other than public works of local interest and sanitation; and in Senegal recent enactments have transferred the responsibility for public health from the mayors to European officials appointed by the Lieutenant-Governor.¹ Again, on the constitution of the city of Dakar as a special district under a European administrator in 1924, the powers of the mayors of Dakar and Gorée in connexion with police and with local roadways were transferred to this official, while a corresponding change was made in the other two communes in 1927.² The executive functions of the communal governments are now largely confined to the registration of vital statistics and the like.

A *Conseil Général du Sénégal*, corresponding to the departmental councils of France, was introduced in 1879. It consisted of twenty members elected by *citoyens français*; as these included all persons born in the four communes, they elected African representatives, who were, however, required to be able to speak, read, and write French. Its powers included the imposition of taxation and the management of public property.³ When French administration was extended to the hinterland the scope of the council was confined to the four communes. This limitation was regarded with some resentment by the council, and eventually the demand for a local representative body for the whole colony was met by the creation of a *conseil colonial*, including representatives of both subjects and citizens, an organ which is unique in French Africa.⁴ This body, constituted in 1920, consists of

⁴ Decrees of Dec. 4, 1920, Mar. 30, 1925, and Jan. 13, 1930.

44 members, of whom 26 are elected by the French citizens of the whole colony, while the remaining 18 are elected by native chiefs from among their number at a meeting presided over by an administrative official; roughly three-quarters of the members of the council are African. It has an executive committee consisting of representatives both of the citizens and both of the chiefs. It may legislate (*statuer*) on matters affecting the management of public property and the contribution of the colony to public works executed by the central government. On these matters its decisions come into effect automatically if they are not vetoed by the Governor-General within two months; it does not, however, appear that the power to legislate is widely used. It may also make recommendations with regard to taxation, but these need the approval of the Governor-General, acting on the advice of the *conseil de gouvernement*,¹ before they come into effect. It may express opinions on questions submitted to it by the Lieutenant-Governor and it is called upon to approve the budget drawn up by him. This is, in practice, its most important function, since discussion of the budget permits of a considerable latitude in criticism of the administration. The actual power over finance is, on the other hand, limited by the standing distinction between *obligatoire* and *facultatif* heads of expenditure. In the colonial budget the obligatory expenses include the service of debt, the maintenance of the administrative services, secret funds, fixed by the Governor-General, and contributions towards the metropolitan or federal budgets. The chiefs as paid agents of the government have tended to form an official opposition to the citizen members, and the history of the council is one of unfortunate bickerings between these parties.

The decree of 1920, which constituted the colonial council, also created a *conseil privé* or executive council advisory to the Lieutenant-Governor, which is organized independently of the elected body. The members of this council are the secretary-general, procurator of the Republic at Saint Louis, military commandant of the colony, a French citizen elected by the chamber of commerce of St. Louis, and one citizen and two subjects nominated for a period of two years.

¹ See below, pp. 200-1.

Within the three communes the *citoyen*, as already shown, comes under French law, modified as regards personal matters by a special native code drawn up for his benefit. Outside the communes there is a clear distinction between *citoyens*, who are subject to statutory law, and *sujets*, who remain under native customary law. A native who wishes to acquire the status of *citoyen*, a process analogous to naturalization, must conform to definite standards. In French West Africa the conditions were prescribed in a decree of May 25, 1912, which may be taken as a manifestation of the reaction from the earlier 'assimilationist' theories of France to the present policy of a more gradual development. The main conditions imposed were that the candidate for citizen status must be 21 years old, be able to read and write French, have given evidence of devotion to French interests, or have been in French employment, public or private, for at least 10 years. In 1932¹ the age was reduced to 18, but further conditions were imposed; the candidate must, with his family, have adopted a civilized manner of life, be monogamous, have had his children educated in French, and have fulfilled his military obligations. A special measure passed in 1918 provided that natives who had obtained the Military Medal or *Croix de Guerre* might obtain naturalization by a simple declaration, but only fourteen persons did so.² In 1935³ the fact of having contracted a civil marriage with a Frenchwoman and being the father of a child by the union was admitted as an alternative to the period of service in French employment.

In 1937 two new stipulations were added: the applicant must have made no demonstration of hostility to France nor have been convicted of any crime.⁴ The legislation of 1937, however, extends the facilities for naturalization in various ways. It allows persons who have obtained the leaving certificates of higher primary or secondary schools to qualify by five years in French service, as against the ten years' service demanded in other cases. It also provides for the unconditional grant of citizenship, on application, to persons who have either received the Legion of Honour, obtained a diploma of one of some thirty-five institutions

¹ Decree of Aug. 21, 1932.

² Decree of Jan. 14, 1918; see P. Dareste, *op. cit.*, vol. ii, 365-7.

⁴ Decree of July 23, 1937.

of higher education in France, served as an officer in the army, or contracted a civil marriage with a Frenchwoman, provided either that children have been born of the marriage or that it has lasted twenty years. Persons of mixed birth are regarded as French.¹ Up to the present the advantages of the shorter term of military service, of assimilation to Europeans in matters of law and justice, and of exemption from the régime of disciplinary penalties known as the *indigénat*,² have not induced a great number of natives to apply for citizenship. The privileges involved appeal to a limited class, and to the majority do not seem to outweigh the necessity of accepting French law in questions of marriage and inheritance. Naturalizations are said not to exceed twenty yearly and in 1936 only 2,136 of the total of 80,509 *indigènes citoyens français* in French West Africa came from colonies other than Senegal; the total native population of the territory in the same year was estimated at 14,700,000.³

In Equatorial Africa the conditions are similar to those which existed in the West African Federation before the introduction of the amendments of 1937.⁴ In the mandated areas of Togo and the Cameroons the conditions are identical with those in force in Equatorial Africa.⁵

(d) *Local Government Councils outside Senegal*

The organization, both of advisory councils to the governors and of local government institutions, is more or less uniform in the colonies of French West Africa, other than Senegal, and in Equatorial Africa.

Each Governor-General or Lieutenant-Governor has the assistance of an advisory council. Since 1920 these councils and the permanent commissions attached to them have included an unofficial membership.⁶ The Governor-General's council is known as the *conseil de gouvernement*, the councils at the capitals of the separate colonies as *conseils d'administration*. In French West Africa the *conseil de gouvernement* consists of the Lieutenant-Governors of the

¹ Decree of Sept. 5, 1930.

⁴ Decrees of May 23, 1912; Jan. 14, 1918; Sept. 6, 1933.

⁵ Decree of Nov. 7, 1930.

⁶ Decree of Dec. 4, 1920.

seven colonies, the administrator of Dakar, the Commissioner for Togoland, and seven other official members.¹ The unofficial members are the deputy for Senegal, the elected members of the *Conseil Supérieur de la France d'Outremer*, the president of the colonial council of Senegal, and elected representatives of that council, the *conseils d'administration*, chambers of commerce,² and certain other bodies; they include both citizens and subjects. This body meets annually and hears a general report and exposition of policy from the Governor-General. Its main duty is to advise on the budgets of the federation and of the separate colonies: it must also be consulted on public works, loans, and direct and indirect taxation. Its recommendations must be confirmed by decree, but are considered as approved if no decree in the contrary sense is issued within three months of their submission to the minister. The permanent commission, which meets once a month, consists of the official members permanently at head-quarters, the deputy for Senegal, and the representatives of the colonial council, Dakar chamber of commerce, and the commune of Dakar.

The *conseils d'administration* of the West African colonies fall into two groups: those of Guinea, the Ivory Coast, the Sudan, and Dahomey are organized on a uniform plan which includes an elective element, while in the other two colonies the membership of the councils differs. In the first group of councils there are three official members, while the unofficial members are: the delegate of the colony to the *Conseil Supérieur de la France d'Outremer*, two French citizens elected by the chambers of commerce and agriculture respectively, and three French subjects elected by a native electoral college. The electorate consists of natives who have spent five years in the administrative service, chiefs of provinces and cantons, licensed traders, owners of registered urban property worth 5,000 francs, and owners of rural property of a fixed area. The permanent commission of these councils consists of the chief secretary, the procurator of the Republic, and one citizen and one subject from among the unofficial members who are present at the colonial capital at the time of its meetings.

The remaining *conseils d'administration*, that is to say, those in the Niger Colony and Mauretania, are constituted on a smaller

¹ Decree of Mar. 30, 1925.

² See below, p. 203.

scale, having as a rule four official members and two to four unofficial, nominated for a period of two years. The permanent commissions are constituted similarly to those of the first four colonies.¹ The *conseil d'administration* must be consulted regarding the local budget and the accounts, direct taxation, loans, the disposal of government property and land, and other administrative matters.²

In Equatorial Africa the *conseil d'administration* consists of the secretary-general, the governors of Ubangi-Shari and Gabon, and three other officials, the delegate of the colony to the *Conseil Supérieur de la France d'Outremer*, four members elected by the chambers of commerce, who must be French citizens, and four members, French subjects, elected by the native electoral colleges. These elected members must be able to speak French. Its competence is similar to that of the *conseil de gouvernement* in West Africa. The permanent commission consists of the secretary-general and other official members of the *conseil d'administration* resident at Brazzaville, one French citizen elected by the local chamber of commerce, and one French subject also elected locally.³

An administrative council was created in each of the mandated territories in 1920, and reorganized in Togo in 1923 and 1934 and in the Cameroons in 1923 and 1928.⁴ In Togo it consists of the chief secretary, heads of the judiciary, customs and public works, and four unofficial members, two citizens and two subjects (technically described here as *ressortissants* in conformity with the principles of the mandatory system regarding nationality) nominated for a period of two years. In the Cameroons the council also includes the head of the health services. These councils have no permanent commissions.

Provision is made in French West Africa and in the mandated territories for the appointment of local native councils advisory to the administrative officials. In West Africa the constitution of such councils was provided for in the decree of May 21, 1919. Such a council may be established in any administrative division where the native population is sufficiently developed. They consist

² Decree of Mar. 30, 1925.

³ Decree of Dec. 31, 1937.

⁴ Decrees of Mar. 6, 1923; Apr. 13, 1923; Nov. 3, 1928; Nov. 23, 1934.

of eight to sixteen chiefs or other notables nominated by the administrator for a period of three years, and must be consulted on questions affecting taxes or licences, the organization of *prestations*,¹ and the execution of local works.

Shortly after the issue of this decree fourteen councils were created in Senegal, twelve in the Sudan, and six in Dahomey.² The system was extended to Togo in 1922,³ and the Cameroons in 1925.⁴ In Togo some members of these councils are to be elected by the native people as their representatives, while others are chosen by the chiefs among themselves; a council was created at Lomé in 1922. In the Cameroons there is a native council in each of the fifteen districts. Here, too, the members are selected from lists presented to the administrator; a separate list is drawn up by the native commercial community.⁵ The different tribal groups are represented in proportion to the number of tax payers.⁶

Advisory bodies peculiar to the Cameroons are the local committees on agriculture and public health. The former were first established in 1923, the latter in 1925. The African members of the agricultural councils consist of the recognized chiefs of the first rank (*chefs supérieurs*), and two leading native producers from each subdivision. They meet twice a year to discuss any questions relating to agriculture or stock-breeding which are submitted to them; their first meeting is to be held before the planting season to discuss the programme of production for the year; the second to be held after the harvest for the discussion of methods of preparation of crops for harvesting.⁷ The public health councils consist of the local medical officer with six nominated native members, chiefs or other important persons, and must be consulted on measures of sanitation, the prevention of epidemics, the organization of native urban areas, and any other question affecting public health.⁸

It has already been mentioned that in French West Africa the various chambers of commerce are represented in the advisory organs of government, and their constitution must be described.

⁵ P. Dareste, *op. cit.*, vol. i, p. 188.

⁷ *Arrêt* of Dec. 30, 1925.

⁴ *Arrêt* of Oct. 9, 1925.

⁶ H. Labouret, *Le Cameroun*, 1937, pp. 27-8.

⁸ *Rapport annuel du Cameroun*, 1926, p. 35.

These bodies, modelled on similar organizations in France, may be created by *arrêté* of the Governor-General. In French West Africa¹ they are divided into chambers of commerce, agriculture, and industry. The former are elected by heads of commercial establishments who must be French-speaking and literate, but need not be French citizens, the total number being fixed in each case by *arrêté*. Eight such bodies exist; the Togo chamber of commerce at Lomé, created in 1921 and reorganized in 1924,² is elected annually by licensed traders organized on a communal basis: the French citizens elect six members, foreign Europeans four, and natives two. These bodies are the recognized representatives of the economic interests of the locality, and must be consulted on all legislation dealing with commercial matters. The chambers of agriculture and industry consist partly of elected representatives of cultivators, partly of delegates of native co-operative and similar organizations: these, however, are not represented in any central advisory body.

In Equatorial Africa a nominated advisory body jointly representative of commerce, agriculture, and industry was created in 1912³ at the head-quarters of each of the four colonies of the federation as it existed at that time. A similar body was created at Fort Lamy in 1916.⁴ In the Cameroons the chamber of commerce of Duala, created in 1921 and reorganized in its present form in 1933,⁵ is elected every two years. It consists of sixteen French citizens, ten foreign Europeans, and two native members.

Both in French West and Equatorial Africa the gradual evolution of local government or institutions on the lines of those of France has been sought through the creation, as a preliminary, of communal councils in which the membership is partly elected and partly nominated, while the chairman is the local administrator who holds his position *ex officio*. The creation of such bodies in Senegal, outside the area of the four original communes, was first provided for by a decree of December 13, 1891, which authorized the establishment of 'mixed' and 'native' communes. These were to consist of native members nominated by the government, with

¹ Decree of Mar. 16, 1917.

² *Arrêts* of June 21, 1921, and Dec. 8, 1924.

³ *Arrêt* of July 31, 1912.

⁴ *Arrêt* of Aug. 4, 1916.

⁵ *Arrêts* of July 22, 1921, and Apr. 26, 1933.

the local administrative official as chairman, the mixed communes having the same powers as the communes already described, and the native communes being purely advisory.

The creation of mixed communes in urban centres throughout the West African Federation was authorized in 1912, and the extension of the native communes to the colonies other than Senegal in 1921.¹ The councils of the mixed communes are divided into three grades, of which the first are nominated, the second elected by a restricted and the third by universal suffrage.² The classes of persons from which the first-degree councils³ may be nominated are the same as those who are entitled to vote for the councils of the second degree. They comprise French citizens, native agents of the administration, and French subjects who pay a trade licence of at least 200 francs, or are recognized as land-owners of importance. The nominated councils must consist of citizens and subjects in equal numbers. The powers of these councils closely approximate to those of the elective communal councils of Senegal.⁴ In 1936 nineteen first-degree and three second-degree councils had been constituted;⁵ so far there is none in which the members are elected by universal suffrage.

The councils of the native communes, as provided by the *arrêté* of January 16, 1921, are to consist of five to ten nominated members, one of whom is nominated as chairman, and are responsible for the execution of administrative orders with regard to police and sanitary services, the organization of markets, *prestation* labour, and conscription and the collection of taxes. It has not, however, been the practice of the administration to appoint many councils of this type.⁶

The extension of the mixed commune to Togo was authorized by a decree of November 6, 1929. A mixed commune with a nominated council was created at Lomé in 1932 and a native commune at Anecho in 1935.⁷

In Equatorial Africa local self-government institutions are less

¹ Decrees of May 15, 1912, and Jan. 16, 1921.

advanced. Communes were established at Libreville, Bangi, and Brazzaville in 1911, and Fort-Lamy in 1919.¹ The councils are organized on a uniform basis,² and are simply described as *communes*, since the contrast between the *communes de plein exercice* of Senegal and the councils with an official chairman is here irrelevant. They consist of an administrative official as president and four nominated members, of whom one must be a native, and may make recommendations on financial matters, public property, public works, and the administration of justice.

VII. THE BELGIAN SYSTEM

The political organization of the Belgian Congo, forming as it does a single unit whose status is defined by constitutional statute, can be described more succinctly than was the case with the separate units of British territory in Africa or the two French governments-general.

Its constitution dates from the law of October 18, 1908, which formally effected the annexation of the Free State by Belgium; this law is commonly known as the Colonial Charter. By its provisions the power of legislation for the colony is delegated from Parliament to the King, who exercises it by decree; Parliament, however, retains certain rights, particularly in connexion with financial matters³ and the grant of concessions. Both the budget estimates submitted by the Governor-General and the accounts of the colony (which are audited in Brussels by the *Cour des Comptes*) must be approved by law; the authorization of the *Chambre* is also required for colonial loans and commercial agreements affecting the colony. The grant of concessions is made by decree, but all important concessions must be laid on the tables of both Houses for a period of thirty days before the grant can become effective. In the case of the budget the Minister is empowered, if the *Chambre* has not passed it five days before the opening of the period to which it applies, to give provisional approval by decree for three months at a time, and in urgent cases he may sanction supplementary expenditure subject to the retrospective approval of the *Chambre*.

¹ *Arrêts* of Oct. 3, 4, 5, 1911, and Nov. 8, 1919.

² *Arrêts* of July 10, 1920, Dec. 31, 1924, and Jan. 21, 1925.

³ See Chap. X, p. 593.

In addition to his function as adviser to the King on colonial legislation, the Minister for the Colonies issues instructions on the main lines of policy to the Governor-General, and is largely responsible for the appointment and dismissal of administrative officials. Appointments to the posts of Governor-General, Vice-Governor-General, and heads and deputy heads of services are made by royal *arrêté* on the advice of the Minister; all other appointments of European personnel by the Minister himself.

The Colonial Charter created, as an advisory body to the Minister for the Colonies, a Colonial Council. The council has fourteen members: eight are nominated by the King, three elected by the Senate, and three by the *Chambre*. Neither the elected nor the nominated councillors may be members of either house of Parliament, officials engaged in the service of the administration, or employees of any of the commercial companies in the Congo in the management of which the local government participates.¹ One of the nominated and one of the elected members, from the representatives of the Senate and *Chambre* alternately, retires each year, but may be re-nominated or re-elected. This body must be consulted on all decrees. It gives its opinion in the form of a reasoned report which must indicate the number of members who oppose the decree and their reasons; these reports are published along with the legislation to which they refer, and are a valuable source of information on colonial policy. The Minister has power to override the opposition of the Council, but must publish his reasons for doing so; in practice this power is never exercised.² In case of urgency, decrees may be issued by the Minister without consultation with the Council, but it is still necessary for them to be submitted to it for report, and the Council may censure the use of the urgency procedure if it appears to it to have been unnecessary. The Council has also the right to recommend legislative or administrative measures.

There are no other permanent advisory bodies in the metropolis, though temporary expert commissions have been set up from time

¹ See Chap. XX, p. 1401.

² M. Halewyck de Heusch, *Les institutions politiques et administratives des pays africains soumis à l'autorité de la Belgique*, Institut Colonial International, 1934, p. 12.

to time. An example is the native labour committee which in 1928 drew up a scheme for the restriction of the grant of concessions to those whose demand for labour could be met locally.¹ In 1934, again, a special commission of twenty-seven members, including members of the Colonial Ministry and Ministry of Economic Affairs, and representatives of the principal companies interested in the Congo, the Chambers of Commerce, the Senate, the *Chambre*, and the Colonial Council, was appointed to report on measures for increasing the trade between Belgium and the Congo. The appointment of special commissions of inquiry is uncommon, though mention should be made of the two commissions on native labour which visited the Congo in 1925 and 1931.² In 1933 also the present King of the Belgians, then Duke of Brabant, was entrusted with a mission of inquiry into measures for the development of agricultural production.³

An institution peculiar to the Belgian system is the Commission for the Protection of Natives established in the Congo by the Charter. This body is by its constitution independent of the Governor-General. Its present organization was defined by a royal *arrêté* of August 7, 1925. Its president is the Procurator-General of the Appeal Court at Léopoldville, and there are eighteen members nominated by the King for a period of five years from residents in the colony qualified by their position to judge of native interests. It is required to meet annually and prepare a report, which is published, on the measures which it recommends in the interests of native welfare; its members are expressly empowered, collectively and individually, to report abuses and illegal treatment of natives. Reports have in fact been published only for the years 1911, 1913, 1920, 1924, 1929, and 1931. In 1923 the members of the Commission resident in the Katanga Province (now included in the Province of Elisabethville) were created a special sub-committee for that area, which contains the principal industrial centres of the colony.

The Belgian government has devoted special attention to the publication of material on colonial conditions and to the encouragement of the detailed study of colonial problems. The annual

¹ See Chap. XI, p. 646.

² See Chap. XI, pp. 645-7.

³ *Rapport annuel du Congo belge*, 1933, p. 5.

report on the Congo submitted by the Governor-General is issued for public use. The government finances a periodical, *Congo*, devoted partly to studies in social anthropology and partly to the discussion of administrative questions, which includes criticisms as well as defence of official policy. In 1920 a Colonial Congress was organized under the patronage of the King and the Minister for the Colonies, with the double aim of stimulating popular interest in the Congo and encouraging expert discussion of administrative questions. A permanent bureau was set up which organizes inquiries and prepares interim reports, and further full meetings of the Congress have been held in 1926 and 1930. In 1929 a Royal Colonial Institute was founded with the object of encouraging the study of colonial questions in the universities. It has three sections, dealing with the social, natural, and technical sciences, and it offers annually two prizes for essays on colonial subjects, on set themes of which one is concerned with economics, and the other with native administration.

It has already been noted that the Belgian system of dealing with colonial questions has some unusual features. The *charte coloniale* reflects everywhere the revulsion of feeling against the incidents which marred the administration of the Congo Free State. It repeated for the Congo the fundamental laws of right which formed part of the Belgian constitution, and sought to make it possible for the full force of public opinion to be brought to bear on Congo affairs. The provision that the budget of the colony should be approved by Parliament, a measure found neither in Britain nor France, was directed to this purpose; but it is doubtful if it is the method best calculated to achieve it. It inevitably involves great delays; it has frequently happened that the budget has not been passed till half the financial year has elapsed. In 1923 the *Chambres* sought a remedy in enacting that the budget should be voted biennially instead of annually; this was clearly an unpractical step and was reversed in 1925. As a matter of fact, it has been found elsewhere that Parliamentary interest in colonial finances can be adequately met by making provision for a debate on the vote for the maintenance of the Colonial Office. The provision of the *Conseil Colonial* has proved a more effective measure. It may be true, as its critics have contended, that the sphere of the

Council is limited, since it deals only with legislative proposals, not with executive proceedings, and that if it has been critical, it is of the details rather than the principles of decrees placed before it; but it has certainly succeeded in bringing an informed, and to some extent independent, opinion to bear on colonial policy. The Congo Commission for the Protection of Natives has, as has been shown, had a career of somewhat sporadic activity. It owed its origin largely to the suggestion of Roman Catholic missionaries, and has at times ventilated matters in which the Church was interested; its opportunity for useful work must, however, vary with the need for urging the local and home administrations to give due consideration to native interests, and these have not of late years shown themselves deficient in this respect.

It is clear that whatever the exact nature of the constitutional procedure provided, the Ministry of the Colonies has a predominating voice in regulating Congo policy. The extent to which policy can be said to be initiated locally, or to which it is controlled in detail from Brussels, would appear to depend to some extent on the personality of the Minister and the Governor-General of the time. It is true to say, however, that modern practice does not exhibit the same spirit of centralization as marks the attitude of the French Ministry to the Colonies; there is nothing of the underlying philosophy which regards the colony as actually or potentially a part of the motherland. As regards the formal provisions regulating the position of the Governor-General, the *arrêté royal* of June 29, 1933, reorganizing the administration of the Congo, stipulates that the Governor-General must be consulted on all decrees before they are submitted to the Colonial Council. His right to exercise legislative powers, however, remains limited by the terms of the Charter to cases of emergency. In such cases he may suspend the application of decrees in force or introduce new legislation by *ordonnance-loi*. In either case, however, his acts cease to be valid if they are not confirmed by decree within six months. It will be recognized that a similar provision existed in the constitution of British India, and has been repeated in the recent Government of India Act of 1935. M. Pierre Ryckmans, the present Governor-General, has urged the removal of the limitation of these powers to cases of emergency, and suggests that *ordonnance-lois* should be

valid unless specifically disallowed.¹ In view of the difficulties of communication in the early days of the colony, the heads of the different provinces (then known as Vice-Governors-General) were endowed with similar emergency powers by a law of 1911. The administrative system introduced in 1933, however, did not give such powers to the Provincial Commissioners, who now took the place of the Vice-Governors-General. Certain executive actions of the local authority also require the sanction of a decree. While large land concessions require parliamentary approval, concessions of an area of over 10 hectares in urban and 500 hectares in rural areas must be approved by decree. The Governor-General's annual programme of recruitment for the militia (*force publique*) also requires this formal approval.

In 1914 advisory councils were attached to the Governor-General and to each of the then existing five posts of vice-governor-general. In the system introduced in 1933 the central *conseil de gouvernement* is retained and the older *comités régionaux* are replaced by *conseils de province* attached to the Commissioners of the six provinces. The functions of these councils are strictly advisory and the inclusion in them of unofficial members is left to the discretion of the administrative authorities. The *conseil de gouvernement* as constituted in 1933 included as *ex officio* members the Vice-Governor-General, the *inspecteurs d'état* (senior officials responsible for general supervision of administration throughout the country), the procurator-general, and secretary-general. The six Provincial Commissioners or their representatives were added in 1934.

The *conseils de province* consist of the procurator-general of the province or his representative, the district commissioners, other officials nominated by the Provincial Commissioner, and, at his discretion, unofficial residents in the province of Belgian nationality nominated by him. They draw up financial estimates for the province, and must be consulted on all questions affecting native welfare, defence and police, public works, the financial situation of the province, and questions of general administrative policy. The *conseil de gouvernement* and some of the *conseils de province* at present contain unofficial members.

A step in the direction of the development of local government

¹ P. Ryckmans, *La politique coloniale*, 1933, p. 22.

in urban areas was taken by the decree of January 12, 1923, which authorized the creation of 'urban districts' with their own revenues, administered by a specially appointed commissioner, with an advisory council consisting of three to eight Belgian nationals nominated for two years by the Provincial Commissioner. The council must be consulted on the local estimates, which must also be approved by the Provincial Commissioner; as regards other matters the scope of its discussions is to be fixed by the Governor-General. The one urban district so far created is Léopoldville, the capital of the colony, which attained this status in 1923.¹ The powers at present exercised by the advisory committee were defined in 1929.² It is authorized to initiate the discussion of proposals regarding police, hygiene, control of traffic, building regulations, and the like; it may also be consulted on the organization of hospitals, schools, postal services, and town-planning schemes, and the alienation of land. No local regulations can become effective without the approval of the Provincial Commissioner.

Although the legislation of the Congo provides for the *immatriculation* of natives, or their registration as exempt from native law, on very easy conditions, this process does not result, as it does in French colonies, in their complete assimilation to the legal status of Europeans, and would not qualify them for membership of the various nominated councils which have been described. But in comparing the relative progress made in the Congo and French territories in respect of the inclusion of Africans in advisory bodies or local self-governing institutions, it will be realized that conditions in the Congo resemble those of French Equatorial Africa rather than of the West African federation; administrative activity is in the Congo of relatively recent date,³ and the Congo native has not yet made the same advance in education and social standards as marks the natives of some parts of French West Africa.

The mandated territory of Ruanda-Urundi was organized as a vice-government-general in 1925⁴ and retained this status in the reorganization of 1933,⁵ the principal effect of this position

¹ *Ordonnance* of Aug. 10, 1923.

³ See Chap. V, pp. 140-1.

⁵ *Arrêté* of June 29, 1933.

² *Ordonnance* of Jan. 4, 1929.

⁴ *Law* of Aug. 21, 1925.

being that the head of the administration in the territory has the same limited powers of legislation in local matters that are exercised by the Governor-General for the rest of the Congo. The Vice-Governor-General has no advisory council. The separate identity of the territory is safeguarded by the provisions in the law of 1925 regarding finance and legislation. Measures applied to the Congo do not become operative in Ruanda-Urundi, unless specially applied thereto by the Governor-General. The estimates for Ruanda-Urundi are compiled separately from those for the colony, and no transfers may be made between the funds of the mandated area and those of the rest of the Congo. The Vice-Governor-General is not a member of the *conseil de gouvernement* for the Congo.

VIII. THE PORTUGUESE SYSTEM

The constitution under which the Portuguese colonies are at present governed is based on the Colonial Act of July 1930, which was re-enacted in 1933 upon the adoption of a new constitution by Portugal,¹ and completed by the Colonial Charter of the same year.² While a number of subjects is expressly reserved for legislation by diploma of the National Assembly or decree of the Minister for the Colonies, in the limited range of matters not so specified the heads of the local administration have legislative powers subject to disallowance by the Minister. By the terms of the Colonial Act the matters which need the approval of the National Assembly are: the establishment or modification of colonial constitutions, the conclusion of agreements with foreign powers, the authorization of loans requiring special guarantees, and the determination of the powers of the local administrations as regards the granting of concessions. In emergencies the Minister may legislate on these questions with the consent of the Superior Colonial Council (Council of the Colonial Empire). The act lays down general principles of native policy with which local legislation must conform; these include provisions that native rights in land must be respected when alienations are made and that natives may not be compelled to work for private employers.

The Colonial Charter defines further the respective limits of

¹ Decree-law of Apr. 11, 1933.

² Decree-law of Nov. 15, 1933.

legislative competence of the Minister and the colonial governors. Apart from the subjects reserved for the National Assembly, the Minister legislates by decree in matters of general colonial policy or affecting the interests of more than one colony. Among the questions reserved to him are: salaries and status of personnel, the civil and criminal codes applicable to natives and native labour regulations, control of missions, military organization, freedom of the press (a subject dealt with by Parliament both in French and Belgian colonies), the judicial system, currency, and the approval of loans not requiring the sanction of the National Assembly. His executive powers include the appointment, transfer, and dismissal of administrative personnel, the authorization of public works programmes extending over more than one financial year, and the revision of colonial budgets. The reservations in favour of the Minister are therefore extensive, but their operation is materially modified by the fact that he may expressly delegate any of his powers to a colonial governor.

He has the assistance of two advisory bodies, the Superior Colonial Council and the conference of colonial governors. The former council dates back to a body originally nominated by John IV in 1642. In its present form it consists of members nominated by the Minister, members co-opted by them who must not exceed half the number of nominated members, all colonial governors who may be in Lisbon, and expert members, mainly acting or retired officials, who are attached to the separate sections of the council. There are also sections on finance, agriculture and public works, and industry which normally meet separately. This Council or the conference of governors must be consulted on all legislation except in cases of emergency; it may make recommendations, but only on matters put before it by the Minister.¹

The Governors' Conference is held at Lisbon every three years, the agenda being determined by the Minister. An economic conference² is held every five years, in which delegations of officials and colonists nominated by the governors take part, the agenda being determined by the Minister on the recommendation of the

¹ J. de Penha-Garcia, *Organisation politique et administrative de l'empire colonial portugais*, Institut Colonial International, 1936, pp. 261-3.

² Decree-law of Nov. 15, 1933, and *Arrêté* of Dec. 26, 1934.

governors in council. The advisory bodies at head-quarters include councils on education, on the appointment and promotion of personnel, on public works and mines, agriculture, survey, and employment and emigration.¹

Each colonial governor has an advisory council. The councils of Angola and Moçambique include three senior officials *ex officio*, and two nominated each year by the governor. There are five members elected by recognized economic organizations, who must be of Portuguese nationality and European status and be able to read and write Portuguese. (Persons of mixed birth regularly have European status.) The councils must be consulted on all legislative measures, but they may not make proposals involving increases in expenditure or diminution in receipts. In Portuguese Guinea there is an advisory council including elected representatives of commerce and the municipalities.²

At each provincial head-quarters there is a provincial junta consisting of the provincial governor, three officials, three nominated members, of whom one is selected by the Governor-General and the other two by the provincial governor, two representatives elected either by economic organizations or by the twenty principal taxpayers of the province, and a representative of each local government body in the province. It has statutory powers on matters concerning local finance, public works, and public assistance; it also controls the activities of the municipal governments, and may disallow their measures and modify their estimates.

The minor local government bodies are divided into three classes according to their composition, their functions being in all cases the same. They are responsible for the maintenance of public security and hygiene, the regulation of transport, and the organization of markets, slaughter-houses, and cemeteries. Subject to disallowance by the provincial junta, against which they may appeal to the Governor-General, they control the administration of public property, and the organization of public works up to a maximum which is fixed according to the type of local government. In all these bodies the chairman is nominated. In the municipal councils the other members are elected, two by direct vote of the citizens of the area and the other two by the economic

¹ J. de Penha-Garcia, *op. cit.*, pp. 255-7.

² Decree of Mar. 24, 1928.

organizations or by the twenty principal taxpayers. In the municipal commissions two members are nominated and two elected by the indirect process mentioned above. The local juntas have one nominated member and one member elected by the indirect process.¹

Part of Moçambique is administered by the Moçambique Company, which possesses a royal charter granting it sovereign rights for 50 years from 1891. The Colonial Charter of 1933 provides for the transfer of the powers of the company to the Portuguese government as soon as this can be effected in agreement with the company.

Part of the system outlined above is the result of a reorganization effected in 1933 and the following years, which is not yet in full operation; much indeed appears to have been left for determination by rules of practice. Portugal has not yet organized the systematic supply of information on the lines adopted, for example, by Belgium; and it is not easy to ascertain the extent to which some of the institutions referred to have been brought into operation.

IX. THE PERMANENT MANDATES COMMISSION

Mention must be made of the system of supervision of colonial administration which exists in the case of the former German colonies now held under mandate from the League of Nations: South-West Africa, administered by the Union of South Africa, Tanganyika by Great Britain, Ruanda-Urundi by Belgium, and Togoland and the Cameroons, each of which is divided into a French and a British section. It is not necessary to deal here with the history of the mandatory system, for which ample material exists elsewhere, nor with some of the issues of a legal or technical nature to which the operation of the system has given rise. Whether the authority derived from the exercise of a mandate is sovereignty or not; whether the mandatory power is the sole source of legislation for the municipal courts of the territory, or whether they must take cognizance also of the agreements entered into by the mandatory; whether the powers who have left the League can legally claim the same position as those remaining in

¹ Decree-law of Nov. 15, 1933.

it, in respect of equality of treatment in economic matters; these and questions of a similar nature are mainly of juridical interest. In dealing with South-West Africa¹ and Tanganyika, reference has been made to a further question, that of the incorporation of a mandatory area in, or its federation with, the neighbouring territory of a mandatory power; but this again is an issue of which the decision is likely to depend on other than juridical arguments. It is, on the other hand, important to examine the extent to which the existence of the mandate is able to influence the actual course of administration in the areas concerned.

It is convenient to remark in the first place on the nature of the difference in the terms of the two forms of mandate in force in Africa.

Of the African mandated areas, South-West Africa stands alone in the C class, which are described in the League Covenant as those which can best be administered by the mandatory as integral parts of its own territory.² This provision is not, however, entirely peculiar to the C mandated areas, since each of the separate mandates of the B class, to which the other African mandates belong, authorizes the administrative union of the mandated area with neighbouring territory, subject only to the stipulation that measures adopted to that end do not infringe the provisions of the mandate.³ The essential difference between mandates of the B and C class is that in the case of the C class the mandatory is not obliged, as he is in a B mandated area, to accord equality of treatment with his own nationals to nationals of other states-members of the League of Nations, in respect of economic matters. Both types of mandate guarantee freedom of conscience and religion; both prohibit the fortification of mandated territory and the recruiting of troops there for service outside, though in the French territories an exception to this proviso is authorized 'in the case of a general war'; both require the mandatory to suppress the slave trade and the liquor traffic. The B mandates contain two provisions regarding native policy which are not included in those of the C class; land legislation must take into account the rights and interests of the native populations, and compulsory

¹ See above, pp. 177-8. ² *Covenant of the League of Nations*, Art. XXII, para. 6.

³ See above, p. 181.

labour, except for essential public works and services, must be prohibited. Although, however, these clauses do not appear in the C mandates, it is reasonable to hold that the principles which they embody are essential to that 'well-being and development' of native peoples which is stated in the Covenant to be the aim of mandatory administration. In order to provide machinery for observing the manner in which the mandatory authorities comply with the terms of their mandates, the Covenant of the League itself stipulates that each mandatory shall render to the Council an annual report of its administration, and that an expert body advisory to the Council should be constituted to examine these reports.¹ This body, the Permanent Mandates Commission, consists of persons nominated by the Council and removable only by it, who must not be in the employment of any government and are not technically national representatives. Its constitution provides that the majority of its members must be nationals of non-mandatory Powers, and one must be a woman. In practice this has given an original composition of nine members selected from Great Britain, France, Belgium, Japan, Spain, Portugal, Holland, Italy, and a Scandinavian Power. During the period when Germany was a member of the League of Nations a German was added, but retired on Germany's withdrawal from the League in 1933. The Italian member similarly withdrew in December 1937 after Italy's resignation had been announced. The Japanese member, on the other hand, has continued to participate in the work of the Commission, since Japan on withdrawing from the League did not relinquish her mandate. In addition the Commission now has on it one extraordinary member, and when questions concerning native labour are discussed the director of the Native Labour Section of the International Labour Office is present in his expert capacity.

Each mandatory is required to submit to the Commission an annual report on lines indicated by it, and must furnish it with copies of all legislation passed and all special reports published in the course of the year. These annual reports must be published, a provision involving a departure from the usual practice in the case of the French colonies, where such documents are treated as con-

¹ Art. XXII, paras. 7 and 9.

fidential. In the case of Great Britain, where the annual reports from all colonies and protectorates are regularly published by the Colonial Office, those from the mandatory areas tend to be fuller than those from other territories. Further, inhabitants of the mandated areas have the right to submit petitions to the Commission, though not to be heard in person.

The Commission holds two meetings a year, for the examination of these reports. An accredited representative of the mandatory concerned is present at the discussion of each, to give explanations and supplement the information contained in the reports. This representative is usually a senior official of the Colonial Ministry or of the local administration; sometimes both attend together. A report is then prepared for submission to the Council containing comments on the salient points of the administration of each mandated area, and it is for the Council to convey the observations of the Commission to the various mandatories. There is also a general discussion on questions affecting mandated areas, as part of the discussion of the work of the Council in the preceding year which is held at the annual session of the League Assembly. The sessions of Assembly and Council are open to the public; those of the Mandates Commission are private, but a record of the proceedings is published.

The institution of this Commission has resulted in the publication of a considerable body of information concerning colonial conditions, and has made possible valuable exchanges of views between persons in positions of administrative responsibility and experts with experience of different colonial systems. Only those who have had experience of the internal working of an official administration, in circumstances where there is no organization of public opinion, can appreciate the strength of the influence which can be exerted by publicity of the nature of that involved in the proceedings of the Commission and Council. It is significant that in the earlier days of the legislatures created in the British dependencies, the power of interrogation has been valued more highly than that of passing resolutions or motions, or even of voting on a budget. It is not surprising, therefore, that many consider the value of the proceedings of the Commission and Council to lie in the indirect influence of publicity rather than in direct influence

over policy. There are indeed certain difficulties inherent in the form which the mandates have taken. They indicate general policies, necessarily in wide or even negative terms. But experience shows that within the scope of general objectives such as those indicated there is room for a great variety of methods of approach. Subsequent chapters of this Survey will illustrate the wide divergence of the methods used in native administration,¹ in education,² or in treatment of land rights;³ yet it would not be possible to say that any one of the methods used is contrary to a principle capable of so many interpretations as the 'well being and development' of the native populations. In the evaluation of administrative policy the unanimous acceptance of definite standards is not to be expected in a body where many different administrative traditions are represented; it is unlikely, therefore, that the mandatory system will result in the development of uniform methods of administration or in the acceptance by the mandatories of a philosophy of rule in their mandated areas which differs greatly from that prevailing in their own colonies. The Commission is on its strongest ground in dealing with legal questions, and is at times able to point to definite breaches of the mandate, but it would be quite impracticable for it to attempt to control the mandatories in the sense of ordering the application or suspension of specific measures, and its reports usually consist of requests for further information, or in expressions of hope that the next annual report will indicate an improvement in an unsatisfactory situation. Nevertheless, the effectiveness of these comments should not be measured entirely by the form in which they are expressed; in matters where the criticisms can be met without a departure from any major principle of administration accepted by the mandatory, they clearly influence its actions.

X. ADMINISTRATIVE STAFF

(a) *Union of South Africa*

The organization of the civil service in the Union is based on the Public Service Act of 1923. Apart from the professional and technical sections, and the general division, which is made up of

¹ See Chap. IX.

² See Chap. XVIII.

³ See Chap. XII.

the lower-paid clerical grades, artisans, nurses, and the like, it includes an administrative and a clerical division, the former being recruited mainly from the latter. Candidates for entry into the clerical division must have passed the matriculation examination or its equivalent;¹ but it has become the practice to appoint only graduates or first-class matriculants. In 1935 an examination test was introduced, but appointments were not made dependent on the order in which the candidates were placed. The examination is a test of general knowledge, accuracy, and ability to use the two official languages.²

The Union has an unusual feature in the position assigned to its Public Service Commission, which is not only an appointing authority for the posts above mentioned, but was, by the Act of 1923, made responsible for recommending such reorganization of departments as would promote economy and efficiency, and for recommending to the Minister the persons to be selected for all appointments and promotions in grades other than the general division; recommendations of this type, in which the majority of the Commission concur, could not be disregarded without the sanction of the Governor-General. This provision has an interesting history originating with the attempt to balance the claims of the Dutch and British communities in the public service after the Act of Union. The Commission consists of three members; it has been the practice to appoint both Afrikaans and English-speaking members, and the question which section has two members in the Commission is of some importance. At present there are two English and one Afrikaans-speaking member. There have been instances in which the Governor-General has rejected the Commission's recommendations on the advice of the Minister, and such cases have concerned posts of major importance. It is alleged that in many cases the Minister omits to take action on the Commission's recommendations.³ When the Government Attorney's Office was created in 1925 it was provided that its staff should be appointed by the Governor-General without reference to the Commission.⁴

¹ Act 36 of 1936.

² Government Notice 935 of 1934.

³ Union of South Africa: *Debates of the House of Assembly*, vol. xxvi, 1936, p. 362.

⁴ E. H. Brookes, in *Coming of Age*, 1930, p. 342.

An amending act introduced in 1936 provided that recommendations of the Commission should automatically come into force unless expressly overruled by the Governor-General within six months. With regard to discipline, however, a number of changes are made which increase the opportunities for political control in the service and reduce the scope of the Commission's supervision. The Act of 1923 made a distinction between cases of serious misconduct, which were to be investigated by the Commission, and of misconduct not regarded as serious, in which the Minister for the Interior would appoint an official to investigate. This distinction is now removed, and all charges are now to be investigated by an official appointed by the Minister, subject to an appeal to the Commission, whose decision is final.¹

The organization and functions of the Native Affairs Department with its various specialized sections, and the provision for the administration of native affairs in the mandated territory of South-West Africa are discussed elsewhere.²

It is clear that, in spite of the position assigned to the Public Service Commission in the Union, appointments to and promotions in the public service are still liable to be dependent on political considerations. The political and social circumstances of the Union are admittedly of an unusual nature; and it would perhaps in any case be difficult to secure for the services in the Union the degree of detachment which characterizes their position in Great Britain. In one respect, however, criticism seems justifiable. The Union has done little to equip the officers of the Native Affairs department with special training.³ In the past, many men have come into the service with a special knowledge of native language and custom, and the administration of the Transkei in particular owes much to this class; but the department cannot count on the continued recruitment of men with these special qualifications.

(b) *Southern Rhodesia*

The organization of the civil service in Southern Rhodesia is defined by the Public Services Act 29 of 1931. The administrative

¹ Union of South Africa: *Debates of the House of Assembly*, vol. xxvi, 1936, p. 366.

² See Chap. IX, pp. 363-76.

³ See Chap. II.

and clerical branch consists of senior and junior divisions, the former comprising all officers in receipt of salaries in excess of £605 per annum. The policy of the government is to give preference in recruitment to applicants from the territory. No obligatory examination is set and, in pursuance of the policy of giving preference to Southern Rhodesia candidates, vacancies are sometimes filled by applicants who leave school without passing matriculation. Selection is made by a Public Service Commission. The normal retiring age is 60 for men and 55 for women.

An officer of the British treasury, Mr. A. Glen, who was appointed in 1935 to inquire into the administrative system, expressed a doubt whether sufficient officers of the calibre necessary to fill the highest administrative posts would be obtained so long as the field from which they are drawn is so strictly limited, and recommended the imposition of higher qualifications for entry, even though this might make it impossible to fill all the vacancies by local recruitment; in such circumstances, he held, the service would benefit by the appointment of candidates from outside Rhodesia, who should if possible be university graduates.¹

All appointments are probationary for a period of two to five years, and in order to qualify for confirmation every official must pass an examination set by the department to which he is attached. In the Native Affairs Department this examination is concerned with native languages and custom.

Liberal arrangements are made to enable an officer to take a post-graduate or refresher course at a recognized university or professional institution;² provision is also made for the purpose of obtaining teaching or experience in technical subjects. Fellowships for study in Europe are awarded by the Beit Trust; one special fellowship for anthropological study in England was awarded by the South African Institute of Race Relations in 1935; study leave was granted to six officers to enable them to attend a four months' course in African studies at Capetown University.

The division of administrative functions between magistrates and native commissioners, according as the district concerned is predominantly native or European, is similar to that followed

¹ *Report of the Commissioner appointed to enquire into the administrative system of Southern Rhodesia*, C.S.R., 1—1936, p. 8.

² Government Notice 772 of 1936.

in the Union.¹ It was suggested in Mr. Glen's report² that in view of the overlapping of their functions a fusion of staffs would be desirable in itself, apart from the economies which would result; the objective should be to make the junior staffs interchangeable at those stations where there is a magistrate of the judicial department with an assistant native commissioner.

(c) *The British Colonial Service*

Uniform conditions regarding recruitment and training are in force throughout the British colonial territories. Colonial Regulations of general application limit the governor's power of appointment to posts carrying an initial salary of £200 a year, or, subject to the Secretary of State's approval, £200-400; in no case may he appoint persons not resident in the colony. Except for certain local variations from this principle of a minor character, all other appointments are made by the Secretary of State.³

Appointments to the administrative staff of the tropical African dependencies are made by the Colonial Office after selection on the basis of the candidates' qualifications and record; in recent years the candidates selected have all been in possession of a university degree, usually with honours. A university degree is not, however, an indispensable condition of appointment, and has sometimes been dispensed with when candidates have come forward with special experience. A year's course of training at government charge is given at Oxford or Cambridge. The subjects of instruction include the principles of law; elementary surveying and field engineering; African colonial history, geography, and anthropology; tropical economic products, agriculture, and forestry; tropical hygiene and sanitation; phonetics and African languages. It is obvious that, given the time available, instruction in some of these subjects can only be of a most summary character.

Africans have been appointed to senior posts, chiefly in the judicial, medical, and agricultural departments, and also in the secretariat. These are described later in connexion with other African staff.⁴ No African district officer has yet been appointed.

The administrative branch of the colonial service was constituted

¹ See Chap. IX, p. 368.

² Op. cit., C.S.R. 1—1936, p. 9.

³ *Colonial Service. Recruitment No. 2*, 1936, pp. 10-13.

⁴ See below, p. 235.

as a unit in 1932, but owing to the importance attached to local knowledge and experience, transfers from one colony to another are not frequent, except in the case of governors and colonial secretaries, who are normally not appointed to the territory in which they have done most of their service, and to some extent in the case of the higher officials in the secretariat. An officer cannot be compelled to transfer to a colony offering less favourable terms than those on which he was engaged to serve.¹

The initial salary is £350 in the East African and £400 in the West African dependencies. After two years service on probation as a cadet, salaries rise by regular increments, subject to 'efficiency bars' at £600 in East Africa and £630 in West Africa, and at £840 throughout the service, to £1,000, the maximum for a district officer. Cadets are required to qualify for confirmation of their appointment by passing examinations in law and in a native language, and in order to pass the efficiency bars officers must pass additional language examinations and obtain a certificate of efficiency from their superior officer. Senior posts carry higher salaries; this applies to the position of Provincial Commissioner or Resident (the term used in Nigeria), to the senior positions in the secretariat, and to certain major posts peculiar to individual territories. The table on p. 226 shows the actual position as regards staff in the various territories.

Provisions regarding leave vary in the different territories. Northern Rhodesia has a tour of service of 20-36 months; in Nyasaland and Uganda the tour is 2-3 years; in Tanganyika the tour is 20-30 months; in Kenya officers with less than 10 years service serve a tour of 3-4 years, those with over 10 years service have a tour of 2-3 years. In West Africa the tour varies from 12 to 24 months. The period of leave differs correspondingly; free passages are provided with allowances towards the cost of passages for wives and in East Africa for children. The age of retirement is 50 in West Africa; in East Africa it was raised to 55 in 1933.²

In the British dependencies the secretariat does not form a separate service as is the case in the French and Belgian colonies; the practice varies, but in some colonies it is staffed, as far as the junior posts are concerned, by seconding members of the general

administrative staff. It is also the practice to maintain contact with the Colonial Office both by the temporary attachment to the Colonial Office of junior officers selected from the administrative service and by seconding members of the permanent staff of the Colonial Office for temporary service overseas.¹

In the past a number of the East African territories—Northern Rhodesia, Nyasaland, and Tanganyika—have had at head-quarters a Secretary for Native Affairs whose function was to co-ordinate native administration throughout the territory and, as a member of the executive council, to give expert advice to the Governor. In Northern Rhodesia this post was abolished in 1934,² it being held that the advice formerly tendered by the Secretary for Native Affairs could equally be given by the Senior Provincial Commissioner. The mode of control of native affairs envisaged was that policy should be agreed upon in an annual conference of provincial commissioners with heads of departments; a special selected officer of the administration should be posted to the secretariat as Assistant Secretary for Native Affairs, and would keep in touch with provincial commissioners on questions of policy.³ Tanganyika appointed a Secretary for Native Affairs in 1925 at the time of the introduction of indirect rule. In 1934 this office was merged with that of Deputy Chief Secretary, the reason given being that the supervision of native affairs should be the concern of the whole administration rather than of a specialist officer. In Nyasaland the Senior Provincial Commissioner was appointed Secretary for Native Affairs in 1931; in the following year the post was abolished as a measure of economy. Kenya appointed a Chief Native Commissioner in 1918; his position and functions have been the subject of some discussion.⁴ In the Gold Coast the Secretary and Assistant Secretary for Native Affairs are secretarial officers.

The British territories are generally divided into provinces in charge of senior district officers entitled Provincial Commissioners or (in Nigeria) Residents, who administer the area, under directions of the Governor conveyed through the secre-

tariat. Provinces are subdivided into districts in charge of administrative officers called District Commissioners, assisted by junior administrative officers and cadets. A District Commissioner receives his instructions from the Provincial Commissioner, and this officer, as the channel of communication with head-quarters, has complete control of the administrative functions of the district staff. In Nigeria Chief Commissioners over groups of provinces have their own secretariats and form the link between the Provincial Commissioner or Resident, and the central secretariat, a system which originally reflected the marked difference between the conditions of the Northern and Southern Provinces; it may be doubted whether to-day this does not tend unduly to diminish the position of the Resident and to increase difficulties of departmental co-ordination.

The problem of co-ordination arises not in respect of the ordinary work of administration, but in regard to the relations of the technical departments to the district and provincial authorities. In earlier times this question of co-ordination assumed little importance, but the growth of technical services and the complexity of the functions of district officers have raised problems that may be said to have two aspects: the first concerns the effectiveness of this system in allowing for the most economical use of staff, and the second, the development of systems of indirect rule which have local self-government for their avowed object and which, for the time being at least, must remain under the close supervision of the district officer.¹

It is one of the conditions of rapid development that technical staffs should grow quickly in personnel, should take an increasing part in activities which directly touch the life of the people, and should absorb an increasing share of the general revenues. In countries with responsible governments, these activities come under the control of ministers with joint responsibility; in India, a solution was found in bringing them under the charge of an executive council in which the departments of government are grouped under and controlled by authorities who are part of the government, mutually responsible to their colleagues but themselves detached from departmental work. In the absence of some

¹ See Sir F. D. Lugard, *The Dual Mandate in British Tropical Africa*, 1929.

such system of control there is always a danger that the administration may show evidence of unbalanced working. The absence of co-ordination is seen most markedly in such departments as those of health, sanitation, agriculture, or veterinary work. Departments tend to trench on each other's field of work, with the result that there is not only overlapping but even, at times, a conflict of policy. Much can be done towards the co-ordination of policies by mutual discussion between heads of departments and local authorities, but the direction of policy cannot rightly be settled by inter-departmental compromises. In theory, the Governor is the controlling agency, but he is to a great extent dependent on a Chief or Colonial Secretary who may find the burden excessive. The difficulties of the position of a Chief Secretary as the sole co-ordinating officer and the principal channel of communication with the Governor in a complex administration were detailed in Sir Alan Pim's report on Kenya.¹ It was there suggested that the system of concentrating every branch of work in this officer should be replaced by one in which the various departments should be grouped under several secretaries to government, each secretary standing in the same relation to the Governor, the Colonial Secretary remaining as Chief Secretary, the deputy of the Governor, and the head of the administrative service. For Kenya, three secretaries were suggested, a Colonial or Chief Secretary, a Secretary for Native Affairs, and a Financial Secretary. In many of the African dependencies conditions would not justify the creation of an executive council of the Indian type; but failing this a solution may be found by a reorganization of the secretarial system on the lines advocated by Sir Alan Pim. The principle may be said to have to some extent been recognized in Kenya itself and in other colonies such as Tanganyika,² Uganda, Northern Rhodesia, and Nigeria, where financial secretaries are to replace the present heads of treasuries. Under the system proposed, the secretaries would refer to other secretaries matters likely to affect them; they would be responsible to the Governor for bringing to his notice matters in which there were departmental differences, or which

¹ *Report*, op. cit., Colonial 116, 1936, p. 71. Sir A. Pim made the same criticism in Northern Rhodesia: see *Report*, op. cit., Colonial 145, 1938, pp. 160-1.

² *Tanganyika Annual Report*, 1937, p. 24.

are likely to affect the public or influence general policy. It is a sound rule also, that while secretaries have authority to deal with details, they must disclose to the Governor any case in which it is proposed to overrule the recommendations or criticize the action of heads of departments, or the senior administrative officers.

The technical departments deal with problems the right handling of which is vital to the future of Africa. In any adjustment which is made, it is essential to avoid anything which would impair their enthusiasm or prejudice their independence in technical matters and in the maintenance of the discipline of their own establishments. But the need for closer co-ordination of work has been increased by the growing use made of native authorities as agencies of local self-government. It was once stated that in Kenya, for example, every department was a complete unit, and important administrative health work was divorced entirely from the direction of the administrative officer.¹ Such a restriction of the activities of the administrative officer might negative his influence with native authorities and expose these to a pressure of demands which they might not be able to bear. It has been well said that 'the general control of Administrative Officers is vital to the success of indirect rule, especially with immature native administrations, but it throws a serious responsibility upon them to understand and to assist the work of the Departments'.² Sir Donald Cameron's instructions regarding the relations between administrative officers recognize the increasing part which departmental officers must in future play in the development of the native administration, and he insisted on the subordination of these activities to the administrative officer, who 'must be regarded as the judge of the effect of any activity on the conditions of the province, political or otherwise, from the native point of view'.³ What, however, has been suggested in the preceding paragraph is not subordination, but machinery for obtaining joint direction at the top, which would involve in turn the necessity for joint action below. The reorganization of district and provincial boundaries that has taken place in recent years, in

¹ J. L. Gilks, 'Public Health in Rural Africa,' *Journal of the Royal African Society*, vol. xxxiv, 1935.

² M. Perham, *Native Administration in Nigeria*, 1936, p. 301.

³ *The Principles of Native Administration and their Application*, 1934, p. 41.

Northern Rhodesia and Tanganyika for example, has allowed for a strengthening of the position of the Provincial Commissioner, by grouping large areas, containing districts with similar problems and kindred tribes, under one administrative head. The enlargement and reorganization of provinces and districts in order to allow for the employment of a subordinate staff in disposing of much routine work which in a small district is done by the administrative officer himself, is indeed a measure which has suggested itself in more than one colony.¹ It is clear that the administrative head should be relieved of petty and office work if he is to have the time to deal with the problems which arise when the work of the technical departments comes into contact with that of the officers of the general administration.

Nothing impresses itself more forcibly upon the observer of African administration than the frequent transfers of administrative officers from one station to another. An analysis of changes of staff in Kenya shows that one officer was posted to as many as 11 different stations in 6 years. The problem is, however, by no means peculiar to East Africa; it exists possibly in a more acute form in West Africa. It is of exceptional difficulty owing to the shortness of the period of 'tour' necessitated by health and living conditions in the African colonies.² The period of 'tour' has been gradually extended to meet the progressive improvement in conditions of living, and most expert evidence seems to oppose a further extension at the moment. The question of the frequency of transfer is, however, one which invites the most earnest attention. Universal experience shows that lack of continuity in the administrative services produces one inevitable result—the decay of the factor of personality and the substitution of a mechanical routine of administration. The mischief is accentuated in areas under indirect rule, where success depends on the personal relations between district officers and native authorities, and demands on the part of the former an intimate knowledge of the language and customs of their areas.

Though in principle officers of the colonial service are liable to

¹ *Report*, op. cit., Colonial 116, 1936, pp. 92–102. *Report on the Financial and Economic Position of the Bechuanaland Protectorate*, Cmd. 4368, 1933, pp. 58–63.

² See above, p. 225, and below, pp. 237 and 242.

transfer to any of the British colonies, in practice, transfers from Africa, or indeed from one colony in Africa to another, are infrequent except among the higher branches of the service. But this type of transfer, involving mainly officers of the standing of Governor or Chief Secretary, produces its own difficulties. A change of Governorship may coincide with one in the office of Chief Secretary; neither of the new incumbents may have had previous experience of the colony, and may perhaps have had only a limited experience of Africa.¹ It is contended that the system gives the African colonies the benefit of experience of service outside Africa; and enables the Colonial Office to try out its senior officers in some of the smaller governorships in its charge before appointing them to important charges in Africa. It may be doubted whether the experience gained in some of the outlying dependencies of the Empire is of any material value in solving the problems of Africa. The system does not secure a governor in the tenure of his post for a fixed number of years; and where the tenure of the head of the administration is of uncertain duration, routine problems are apt to exclude the consideration of general policy, and attention concentrates on the efficiency of the machinery of government rather than on the direction in which the machine itself is going. It is a matter for consideration whether the strength of the establishments now employed in Africa, and the importance of the issues of policy which now present themselves, do not afford strong reason for constituting a separate branch of the colonial service, confined to employment in Africa.

One other general observation appears to be justified. The organization of administrative work in Africa is still, in a technical sense, in a somewhat elementary stage. District officers are still overburdened with routine work which, in modern conditions, could suitably be discharged by subordinates. This point will be further discussed at a later stage.² But in addition, the system of accounts appears to be imbued with traditions of an age when the staff were recruited from sources which did not always leave their integrity beyond suspicion. Elaborate precautions are taken to prevent the loss of amounts of money, or irregular expenditure, by

¹ See Northern Rhodesia, *Legislative Council Debates*, May 31, 1938.

² See below, pp. 233-5.

systems of accountancy which are an added burden to the administrative officer, who is more often than not a sub-accountant responsible to the Treasurer for the expenditure of other departments as well as from his own vote. The Audit Department carries out a detailed check on the expenditure of the smallest amounts; yet in some dependencies the Treasury duplicates all this with its own system of checking, and Provincial Commissioners are sometimes so eager to protect their officers against Treasury investigations that they also conduct a detailed examination of accounts.

(d) Subordinate Staff in the British Colonial Dependencies

In the early days of British administration in East Africa subordinate personnel were recruited from India in the absence of qualified Africans. The terms of service of the Asiatic staff in Nyasaland and Uganda continue to be regulated on the assumption that they are normally persons whose homes are in India. In Uganda, however, Asiatics are now not in principle appointed to posts for which qualified Africans are available. In these territories the Asiatic staff consists of three grades whose salaries rise from £90 to £300. Both in Tanganyika and in Kenya local civil services have recently been constituted, consisting, in Tanganyika, of a unified service for Asiatics and Africans, and in Kenya of separate services for Europeans and Asiatics.

In Tanganyika the institution of such a service was first proposed in 1933,¹ with the dual aim of effecting economies in the payment of Asiatic personnel and providing openings for the employment of educated Africans. The policy enunciated in 1933 was to recruit Asiatics from outside the territory only where special qualifications are required, as for example for the medical and legal departments, and for other posts to make no differentiation in conditions of service between Africans and Asiatics, the African civil service, created in 1927, being merged in the new local service. Regulations constituting this service were issued in 1935.² The salary scales previously in force were 30s. to 360s. a month for Africans and 150s. to 600s. a month for Asiatics; on the new uniform scale learners and apprentices receive 30s. to 60s. a

¹ *Governor's Dispatch to Secretary of State, Sessional Paper, no. 10, 1933.*

² *Regulations for the Local Civil Service, 1935.*

month, and salaries in the fixed establishment rise by five grades from 60s. to 500s. Asiatics, however, will normally enter at Grade III with an initial salary of 137½s. a month.

In Kenya the desirability of reducing expenditure on personnel was explained by Sir Edward Grigg when Governor in 1926.¹ In 1931 unofficial opinion urged as a means to this end the constitution of a subordinate branch of the civil service, locally recruited, which would have the additional advantage of offering employment to the local European population. This service was constituted in January 1935.² The normal educational qualification is the Cambridge Junior Examination. Salaries in the fixed establishment range from a minimum of £150 to a maximum of £660. Overseas leave is given on a basis which makes a visit to Europe possible every four years.³ The number of posts scheduled for inclusion in the local service was 729, the majority being in the departmental services. Of these in January 1933 only 7 per cent. were filled by persons locally born or locally educated, and it appears that in effect the new service must continue for some time to be recruited from overseas, and that the less attractive conditions offered in it must be justified by the lower qualifications required of its members rather than by the fact that members of this branch are not serving at a distance from their homes.

A local Asiatic service was also inaugurated in Kenya in 1935.⁴ The minimum salary is £90, the maximum £408. It is pointed out that the great majority of the Asiatic civil service are persons whose homes are in Kenya. The creation of these separate services met with strong opposition from the Indian members of the legislative council as a measure of racial discrimination.⁵

In Uganda the conditions of employment in the African civil service were laid down in 1929.⁶ Professional or educational qualifications are required; leaving certificates of approved institutions of higher education are accepted as qualifying for entrance; in their absence a candidate must pass a special examination. The

⁶ Permanent African Civil Servants' Regulations, 1929. See also *Higher Education in East Africa*, Colonial 142, 1937, p. 28.

maximum salary payable, except in the case of promotion to the special grade, is 240s. per month. The minimum scale, payable to persons with 2 years training, is 80s. per month; for those who enter by special examination the salary grade is based on the results of the examination.

In West Africa positions of responsibility which have no parallel in British East Africa are held by Africans. It will be convenient to describe them separately. In Nigeria there were, in 1938, thirty-seven higher appointments, with maximum salaries of £400-£720, including fourteen medical officers, one police magistrate, four assistant secretaries, and three technical officers. In the Gold Coast, Africans with a university degree are eligible for posts on equal terms with Europeans. In 1938 there were forty-three African appointments, including a Puisne Judge and the Solicitor-General, the Assistant Secretary for Native Affairs, and eleven medical and ten technical officers. In Sierra Leone higher appointments numbered twenty in 1938, including the Senior Medical Officer and five others, one Assistant Treasurer, and one technical officer. In the Gambia two medical officers and one assistant are Africans.

In Nigeria an African clerical staff selected by examination and with fixed salary scales was established in 1921. In 1934 the examination system was abandoned, and provision was made for the appointment of candidates by selection at initial salaries varying with their educational qualifications from £30 a year up to £60 for graduates of the Higher College at Yaba. Salaries rise by increments to a maximum of £400.¹ The Gold Coast has an African civil service whose members are appointed by a board of selection. It comprises a senior branch, including posts of special responsibility which carry salaries up to £708.² Candidates must have a second-class teacher's certificate or have passed the London Matriculation or Cambridge School Certificate Examination. In Sierra Leone the African staff are admitted by means of an entrance examination, at a salary of £45, and on confirmation of their appointments receive salaries of £54 rising to £372 with efficiency bars at £90 and £200. Candidates who have a British university degree or have passed certain other examinations are admitted without examination.

² *Gold Coast Handbook*, 1937, p. 164.

(e) *The French Territories*

The French administrative service is divided into two separate corps, *administrateurs des colonies*, whose conditions of recruitment and terms of service are fixed by decree, and *agents des services civils*, organized by local *arrêté* in the various colonies. An *École Coloniale* for the training of the *administrateurs* was founded in 1889, and reorganized in 1927.¹ It is now entitled *École Nationale de la France d'Outremer*.

A single competitive examination is now held for admission to the Indo-Chinese and tropical African sections. Up to 1927 the entrance examination could only be taken after a two-years preliminary course at the *École* itself. In that year a non-specialist entrance examination was introduced and the period of training was lengthened from two to three years, in order to cover the subjects formerly taken in the qualifying course. Candidates who already have a university degree, the certificate of the *École Centrale*, or diplomas in mining, engineering, or agriculture, receive a bonus of one-sixth of the total marks gained in the examination. Candidates for the African services take courses in Moslem law and native languages as well as in colonial history and legislation and the more usual subjects.

The tropical African service is organized as a unit, including French West Africa, French Equatorial Africa, and Madagascar, and transfers may be made between any of these territories. The officers pass through a preliminary period of probation as *élèves-administrateurs*; after the probationary stage the service is graded into *administrateurs adjoints* of three classes, *administrateurs* of three classes, and *administrateurs en chef*.² Governors and Governors-General form a distinct class; though they are frequently selected from the administrative service; politicians are also sometimes nominated.³ Secretaries-general ceased to be a distinct class in 1913, and their duties are performed by *administrateurs* or other officials with special qualifications. There is no colour-bar in the administrative service; both in the higher administrative (including that of Lieutenant-Governor) and in

¹ Decree of Apr. 15, 1927.

² Decree of July 10, 1920.

³ P. Daresté, *Traité de droit colonial*, 1931, vol. i, p. 627.

technical posts (including heads of departments) coloured persons may be found. At the moment, however, these are for the most part natives of the West Indies who have qualified themselves in France for entry to the *École Coloniale* or employment in the technical services.

The initial salary of an *élève-administrateur* is 12,000 francs a year, to which a number of supplementary payments must be added. Each colony pays its own local bonus—*supplément colonial*; the rate is fixed by the local government and has varied as widely as from 70 to 120 per cent. of the basic salary. In addition there are an *indemnité de zone*, calculated partly in proportion to the cost of living in different parts of the same colony, partly as compensation for service in unhealthy localities; an *indemnité de départ*, paid on first appointment or on transfer to another colony, family allowances, and various other special payments.¹ The opinion was officially expressed in 1934 that the provisions for special payments were becoming excessive, and a decree was issued providing that all legislation authorizing such payments would cease to have effect unless submitted to the Minister for his approval before January 1, 1935.² The tour of service is two years, followed by six months' leave with full return passage for the official and his family; while on leave an *indemnité de séjour* in addition to the normal salary is paid to cover the extra cost of living in France.³ The law of April 14, 1924, establishes two classes for pension purposes, one retiring at 60 after 30 years' service and one at 55 after 25.

The desirability of a continuity of service which would enable administrative officials to acquire an intimate knowledge of the native peoples under their control is now generally recognized by the French administration, but such continuity has been found as difficult to secure in the French as in other African territories. In West Africa M. Carde, when Governor-General in 1924, introduced a system of *rouage* (designed to prevent corruption), whereby no administrative official should serve two consecutive tours of service in the same colony; but that system is now discredited, and an effort is made to bring officers back to the colony with which

¹ Ibid., pp. 678-81.

² Decree of Apr. 11, 1934.

³ Decree of Sept. 11, 1920.

they are acquainted. In Equatorial Africa frequent transfers add to the difficulties caused by shortage of staff and the slight extent of knowledge of native languages; French authorities have more than once acknowledged the mischief done by the 'instability of personnel'. In the Cameroons a much greater degree of continuity has been achieved.

In the *Secrétariat-Général* a compromise has been effected: here the *chefs* and *sous-chefs de bureau* compose a corps¹ (*cadre général*) available for service in any of the colonies (save Indo-China) and liable to transfer, whilst the clerks form a local organization (*cadre local*), are not transferable, and are amenable to regulations peculiar to each colony. Members of the *cadre général* are recruited from students of the *École Coloniale*, the home service, and sometimes from the *cadre local*: the salaries vary from 34,000 francs a year (*chef de bureau hors classe*) to 10,000 francs (*sous-chef de bureau stagiaire*). The *cadre local* is recruited as to one quarter among candidates under 30 possessing secondary school qualifications who have passed an examination uniform throughout the colonies; three-quarters of the posts are reserved for *ex-sous-officiers*.

The administrative and technical services are supplemented by a large number of European subordinates or *agents*, organized locally throughout the colonies by means of *arrêtés* of the Governor, and not subject to transfer. Thus, *agents des services civils* act as auxiliaries to the corps of *administrateurs*: they are divided into three grades—*commis*, *adjoints*, and *adjoints-principaux*²—but are always subordinate to the corresponding administrative officials. There is no examination for admission, but candidates must have passed their *baccalauréat* and those who have a university degree are placed in the *adjoint* class on appointment. They are employed both in the administrative and judicial services, and can qualify by a competitive examination for admission to the administrative grade, after a one year's course at the *École Coloniale*, but the standard is high and comparatively few avail themselves of this means of promotion. In case of shortage of administrative staff, however, they may be appointed to responsible administrative posts, and this has been done to a considerable extent in Equatorial

¹ Decree of Nov. 24, 1912.

² Decree of July 10, 1920.

Africa. It was announced in 1938 that in future the *agents* also would be selected after a qualifying examination.

The subordinate posts of many departments are similarly staffed by *agents*, who are largely found in primary schools, customs, railways, posts and telegraphs, public works, forestry, and harbours; the conditions of recruitment and service are laid down in innumerable *arrêtés* varying widely from one colony to another. Many of the *agents* are natives, and indeed the main purpose of the French system of native education is to train native personnel for service as *agents* in the administrative and technical departments; in the latter in particular much more use is made of natives with specialized training than in British or Belgian territories. The training, however, is not such as to qualify natives for responsible posts, and it does not appear to be the intention of the French administration that they should eventually occupy such posts.¹

The organization of French West Africa involves two characteristic features: a high degree of centralization in administrative activity, and the evolution of a system under which much of the work which in British territories would be discharged by the technical departments is entrusted to administrative officers with their staff of *agents*. It is, for instance, the administrative officer who is primarily responsible for the systematic increase of production under the *mise-en-valeur* policy;² some of the technical departments, such as those of agriculture or animal husbandry, tend to become exploratory and advisory rather than executive agencies. It has more than once been recognized that the general organization involves an undue concentration of authority. An *arrêté* reorganizing the central administration, introduced in 1923, suppressed a number of technical services which were duplicated in the separate colonies and created instead a smaller group of *Directions* and *Inspections*, the members of which, as their names imply, were to advise the Governor-General on broad lines of policy, but not to control the activity of the local technical services. There are four *Directions*—Cabinet (Civil and Military), Finance, Political and Administrative Affairs, and Economic Affairs, the last named including the *Inspection* of agriculture, veterinary and forestry services. There are also *Inspections* of public works, medical and

¹ See Chap. XVIII, p. 1267.

² See Chap. V, p. 141.

educational services. An Office of agricultural production and credit was added in 1929.¹ Research is centrally organized, and is frequently carried out by missions from the home departments concerned. As an example of central organization in the federation it may be mentioned that there is one geological research service for the whole of French West Africa, the local Mining Departments being concerned only with the enforcement of regulations.

In 1932 M. Brévié, then Governor-General, again urged the importance of decentralization. As he interpreted the function of the central government, it should outline policy, but should not suppress local initiative by frequent intervention in matters of detail. The burden of correspondence should be lightened by confining the reports asked for to matters of major importance; officers of the technical services should be responsible to the local administrative officials (*commandants de cercle*) and should not have to refer proposals for action to the heads of their departments at the colonial capital. The time gained by the reduction in office work should be spent in maintaining contact with the natives. Local initiative should be developed by the requirement of a programme of development work for the year to be submitted by each *cercle* for the Lieutenant-Governor's approval.² The five years of M. Brévié's term as Governor-General, however, were not sufficient to provide evidence of any considerable reaction against the tradition of centralization.

In Equatorial Africa the reorganization of 1934,³ which divided the territory into twenty large departments, was intended to assist in producing a decentralization of administrative control. While, however, in the Cameroons the *Chefs de Région*⁴ effectively control the work of the technical officials stationed in their areas, control from head-quarters appears to be still maintained in Equatorial Africa. The Governor-General appointed in 1936, M. Reste, proposed as a means of decentralization the separation of the budgetary allocations for the four *régions* (the former colonies of the federation);⁵ it should be noted, however, that this still

¹ *Arrêté* of Dec. 26, 1929.

⁴ See above, p. 192.

⁵ Address to the Conseil de Gouvernement, *L'Afrique française*, Mar. 1937, p. 132.

leaves the departments dependent on the governors of the *régions*. M. Reste also reorganized the central services by creating agricultural, veterinary, and forestry services to advise the local authorities, and two inspection services, one responsible for general administrative policy, the other for labour conditions.¹

In this colony, with its territory four times the size of France and its slender resources, the maintenance of an adequate staff has presented unusual difficulties. In 1908 the civilian administrative staff numbered only 107; this was increased to 495 by 1914; in 1926, 363 administrative posts were provided for in the estimates, but it was only possible, owing to the lower rate of local bonus offered in this colony, to fill 112 of these. Of the technical services the registration, customs, and medical departments were at that time stated to be seriously understaffed, while no veterinary officers had been appointed.² In 1927, however, a local supplement equal to the basic salary was offered.³ In 1928, 250 administrative posts were filled out of a total of 366 provided for. The educational staff had only 16 members for 29 posts, the agricultural 7 against a total required of 15, the public works department 140 out of a total of 158 posts offered, and the postal service 61 for 78 posts.⁴ The bonus for colonial service was later increased to 120 per cent., but reduced once more to 100 per cent. as a measure of economy in 1933; at the same time all salaries were reduced by 10 per cent., and personnel was reduced to the numbers regarded as an indispensable minimum—206 administrative officials, 211 officials of the *services civils*, with 175 technical officers including a health service numbering 69. The policy of filling as many subordinate posts as possible by suitably trained natives was announced in this year.⁵ In the meantime it has been the usual practice to fill posts for which candidates with the statutory qualifications are not forthcoming by members of the subordinate local service (*service civil*). In the Chad region three of the four departments and fifteen of the twenty-four subdivisions are at present administered by military officers.

(f) *The Belgian System*

Both the administrative and technical services in the Belgian Congo are divided into grades known as *fonctionnaires* and *agents*; these grades again are subdivided. Appointments are made to an initial rank depending upon the educational qualifications of the candidate. Only second-class *agents* are appointed without a university degree. A course of training designed as a preparation for the service is given by the faculty of political science of the *Université Coloniale* at Antwerp, which also comprises a commercial section. The administrative course has the characteristics of a general rather than a technical education. The latter is represented by the shorter courses at the *École Coloniale*. The university course extends over four years; the period of military service is spent between the second and third years. A competitive examination is held at the end of the first year, after which only the number of students for which there are vacancies in the colonial service are allowed to continue with the administrative course.

Persons appointed to the service without having studied at the *Université Coloniale* are obliged to take a shorter course at the *École Coloniale* at Brussels, the programmes of which are fixed by regulation of the Minister for Colonies. The courses are organized in a higher and a lower section, the latter being designed for persons without university training who enter the service at the lowest rank; these persons can qualify for entry to the *fonctionnaire* class by taking the higher course after ten years' service.

The conditions of service in the Congo are regulated by a series of decrees which came into force in 1935.¹ The tour of service is three years, at the end of which six months' leave is due. Both *fonctionnaires* and *agents* are on probation for their first tour. The full term of service was increased in 1934 from eighteen to twenty-three years, including the probationary tour but exclusive of leave periods. Officers with twelve years completed service might retire or be asked to retire, in which case they would be entitled to pension. This period was increased to fifteen years in 1934.

Under the *arrêté* of 1934 *fonctionnaires* were graded in two main classes—*administrateurs* and *commissaires*—and *agents* into three

¹ *Arrêté royal*, Sept. 24, 1934; *arrêté ministériel*, Nov. 10, 1934.

grades—principal, first, and second class. The initial salaries for the three grades of *agents* are 40,000, 45,000, and 50,000 francs a year. In the *administrateur* class initial salaries rise from 40,000 francs for fourth-class *adjoints* to 150,000 for provincial commissioners. In each grade an increment of 5 per cent. on the basic salary is due at the end of every two years for eight years, followed by three further increments at a variable slightly higher rate at the end of each subsequent three years. These periods include time spent on leave. Family and travelling allowances are paid.

Appointments to the *fonctionnaire* class are made by royal *arrêté*, to the *agent* class by ministerial *arrêté*; the Governor-General is also authorized to appoint *agents*. The posting of officials is left to the Governor-General, and does not necessarily take into account the language which they have taken in their training course. Continuity of service is, however, maintained as far as possible; transfers are seldom made from one province to another, and it is the accepted policy that officers should return to the same district after leave. But there is the same difficulty as elsewhere in preventing frequent changes of staff, and there are cases in which changes have occurred on the average once every two years. The provision that an *administrateur-adjoint* may act for the *administrateur territorial* in the latter's absence helps to secure continuity by making it unnecessary to replace every *administrateur* who goes on leave. There are certain disadvantages, however, in the extension of the principle of continuity to the secretariat. No transfers are made between the secretariat and the districts, even in the special departments of native affairs and labour.

The Congo is divided into 6 provinces, 16 districts, and 104 *territoires*. The mandated territory of Ruanda-Urundi is divided into 2 residencies and 15 *territoires*. The province is administered by a *commissaire de province*, who has local technical services attached to him; he is obliged to visit every district in his province at least once a year.¹ Although the district is a territorial unit, the functions of the *commissaire de district* since the reorganization of 1933 have been developed in the direction of inspection rather than administration. He is obliged to make a detailed inspection of every *territoire* in his district at least twice a year, and to report

¹ *Arrêté royal*, June 29, 1933; *Codes et lois*, op. cit., p. 1967.

on the functioning of the various services; his observations are attached to the reports submitted to head-quarters by the *administrateurs*. The latter are required by the *arrêté* effecting the reorganization to keep in constant touch with native authorities and to guide the development of native institutions. They are obliged to spend 20 days in each month in touring their territories, a provision which sets an automatic limit to the amount of desk-work that can be required of them.

The number of *agents* in each territory is roughly proportionate to the native population, the standard aimed at being one *agent* for every 10,000 taxpayers. They are responsible for the census work to which the Belgian Government attaches much importance,¹ and for various activities for which elsewhere technical departments would be responsible, such as the construction of local public works and the supervision of the programmes of compulsory cultivation.² In British colonies which have adopted the system of indirect rule,³ native authorities are as far as possible made responsible for local activities of this nature, but it seems probable that so long as the Congo authorities can rely on this efficient and inexpensive European service there will be some hesitation in entrusting powers of this description to the chiefs.

In 1936 there were in the Congo, in addition to the Governor-General and the 6 Provincial Commissioners, 23 district commissioners, 287 administrators, and 412 agents; the administrative staff of Ruanda-Urundi consisted of the 2 Residents, 22 administrators, and 25 agents. Provision was made in 1921⁴ for the creation of a native civil service appointed by the Governor-General. This includes teachers, postal clerks, assistants in the customs and medical departments, and public works foremen; in the administration natives are employed only as clerks.

The head-quarters departments in the Congo are the general secretariat, with special sections on native affairs and labour, education, militia, health, finance and customs, budget and audit, public works, economic affairs, agriculture and forestry, posts and telegraphs. In principle, the local branches of these services are

¹ See Chap. IV, p. 120.

³ See Chap. IX, pp. 413-16.

⁴ *Ordonnance* of Feb. 28, 1921; *Codes et lois*, op. cit., p. 278.

responsible to the Provincial Commissioners, who are thus in a position to co-ordinate their work; an exception, however, is made in the case of the medical service, which is centrally controlled.¹

The present system of recruitment is providing the Congo with a very different class of officer, both in the *fonctionnaire* and *agent* class, from that employed in the days of the Congo Free State. There is considerable competition for entry into both classes; the process of building up a service tradition is aided by the training given in the *Université* and *École Coloniale*. The organization adopted appears to give to the *commissaire de province* and *commissaire de district* adequate powers to co-ordinate the work of different agencies of government within the areas under their charge; there is a refreshing absence of office work and a corresponding gain in the amount of touring.

(g) *The Portuguese Colonies*

In Angola and Moçambique there are central, provincial, and local services.² The central services are native affairs, education, public health, agriculture, and veterinary. Angola has a special service of public works, industries, and mines; Moçambique a special service of railways and harbours.³

The provincial services are divided into departments for civil administration and native affairs, the latter being responsible for questions concerning labour, native emigration, native courts, and native welfare in general. Administrative officials are graded as district intendants, administrators of circumscriptions (of three classes), station officers, and aspirants. Secretaries of circumscriptions, who are primarily engaged in office work but are also responsible for census-taking and tax collection, form an intermediate grade between the station officer and the administrator. The service is open to persons trained at the Higher Colonial School at Lisbon, who enter with the grade of station officer, and to persons not so trained who enter as aspirants. In each case

¹ M. Halewyck de Huesch in *Organisation politique et administrative des colonies*, Institut Colonial International, 1936, p. 33. See also Chap. XVII, pp. 1178 ff.

² Decree-law of Nov. 15, 1933.

³ J. de Penha Garcia in *Organisation politique et administrative des colonies*, 1936, pp. 266-7.

their appointment is not confirmed until after a probationary period of five years; a provisional confirmation is necessary at the end of the first two years. Appointments of persons entering at the grade of station officer are made annually on the basis of their attainments at the Higher Colonial School, but without a separate examination; where possible, appointments in each colony are given in preference to persons who were born there or have relations there. Aspirants are required to be Portuguese citizens (which includes persons of mixed blood), and to have had five years' secondary education.

All vacant posts are filled alternately from members of the aspirant class and the graduates of the Higher School. For the latter the only statutory condition of promotion is length of service; they may be appointed secretaries of circumscriptions at the end of the first year of their probationary service, promoted to third-class administrator after two years from the confirmation of their appointment, to first and second class after further periods of two years, and to Intendant after six years as administrators. For aspirants, however, it is necessary to pass an examination for admission to each grade up to that of third-class administrator. Salaries range from 17,000 escudos a year for station officers to 60,000 escudos a year for Intendants.¹

XI. CONCLUSIONS

There can be no one accepted standard for measuring the merits of different forms of colonial government. Negative tests can, it is true, be applied; the failure, for example, to provide the normal safeguards for securing that measure of public order which is the essential basis of all social progress. But the attempt to apply any positive test at once invites a reference to the object which policy sets out to attain, for though historic accident may in some measure influence the shape which a government assumes, the form taken by its major institutions and by its scheme of social services is in the end determined by its accepted conception of colonial policy. There can be no better illustration of this fact than that presented by the governmental system of the Union and Southern Rhodesia. In both countries the prevailing policy is the

¹ Decree of May 31, 1934.

logical outcome of the determination of a dominant white population to adopt for itself, on the political side, the type of responsible self-government which is traditional with both the British and Dutch peoples, and, on the social side, to organize all its institutions with the primary object of maintaining the standards of white civilization. This policy has in the Union produced the series of social, economic, and political institutions which implement the principle of racial segregation,¹ and it is clear that for many years to come, and at all events so long as economic conditions permit the Union to maintain its present scheme of social organization, the major problems of administration will be viewed as conditioned by this conception. In regard to the British Crown Colonies, the accepted policy may be said to have for its objective the creation of institutions designed to assist each unit to achieve the highest social and material advancement which its own peculiar circumstances permit. It is implicit in this policy, that the character of the political or cultural institutions to be adopted must be related to the capacity of each unit for development rather than to any preconceived theory of the value of the institutions of European civilization; it follows again that on the material side, while every effort should be made to increase the contribution which each unit can make to the commercial or military resources of the Empire, this object cannot be allowed to override the primary considerations previously mentioned. But these views constitute a philosophy rather than a policy; their acceptance would not predicate the adoption of any particular type of government; and it is of more immediate importance to discuss the concrete form in which the British colonial philosophy has in practice expressed itself. In the first place, in dealing with the relations between the motherland and the government of the colony, its practice has been to allow as wide a field as possible for local initiative both in legislative and executive activity. It is not to be doubted that it has thus secured the full value of the personality and sense of responsibility of its officials, a benefit which may be held to outweigh the fact that the results achieved are unequal, and that the systems followed in different units present a diversity which must be a source of some bewilderment to foreign observers. For the same reason, ad-

¹ See Chap. V, pp. 130-2; Chap. XI, pp. 664-71; and above, pp. 145-55, and 176.

ministration within the unit is as far as possible decentralized. It is a system under which the British character seems to work at its best, though the foreign critic, traditionally in favour of logically devised and centrally directed policies, is apt to find that in British areas the various administrative and social activities of government, as for example the organization of justice, the regulation of land tenures, the selection of educational or agricultural systems, often fail to follow a co-ordinated scheme of policy. It is not necessary to summarize here the full description given elsewhere of the policy of native administration now prevailing in the British colonies; it is a characteristic effort to devolve authority, over as wide a field as possible, on local self-governing institutions of a typically native form.¹ But the most characteristic outcome of British colonial philosophy is to be seen in the adoption of the legislative council as a standard feature in the organization of the Crown Colonies and Protectorates. It has a double function, as the source of law, and as the chief organ for the expression of public opinion. It will have been seen that use is seldom made of the power of Parliament to legislate directly for the colonies, or of the Crown to create law by the issue of Orders in Council, and the legislative council is now almost the only source of law in the territory. But it is not enough here to accept the legislative council as the outcome of a well-established British tradition. It is necessary to inquire how far it serves the purposes for which it is designed; and further, what is likely to be its future part in the political development of the territory.

It is necessary in the first place to emphasize the true character of the councils as they now exist. In the constitutional sense they remain agencies of an executive government which is itself responsible to the Secretary of State; the executive does not limit itself to the power of veto; it secures its own power to legislate by the maintenance of an official majority.² Compared with the French and Belgian method of legislating by ministerial decree,³ the British system not only has the advantage of ensuring some measure of public discussion on legislative projects, but it provides means for adapting the law to local circumstances; it is perhaps a more

¹ Chap. IX, pp. 413 ff.

³ See above, pp. 185 ff., and pp. 206 ff.

² See above, pp. 162 ff.

satisfactory provision for the latter purpose than the local *arrêté* widely used in the French system. Publicity is not, moreover, confined to legislative projects, but by use of the privilege of interrogation has been extended to the field of executive action. On the other hand, it is an important fact that the councils, as is indeed inevitable in the present conditions of Africa, are not in the normal sense representative; the elective system is confined to Europeans, or in the West Coast to certain sections of Africans; nowhere does representation bear relation to the numerical strength of the different communities. This does not of course involve that African interests go without expression, but in East Africa the extent of the expression given to them is dependent on officials or on non-official Europeans specially interested in native affairs; in West Africa, though African views may receive direct expression, they are voiced mainly by a section with particular interests of its own. In these circumstances, the influence which a council has been able to exert on the course of legislation or of administration, including the expenditure of public moneys, has varied widely in different areas. While there are some areas in which non-official members of the Council have exercised little influence on official decisions, there are others, of which Kenya and the Gold Coast may be taken as examples, where this is far from being the case. The European representatives in Kenya have had an unusual position, for they have more than once been able, when in controversy with the Kenya government, to avail themselves of the support which their connexions have enabled them to secure in English political circles, and, as has been shown,¹ to resist measures which the Secretary of State would have liked to enforce. The European community has on several occasions been able to secure abandonment of projects of taxation put forward by government in the general interests of the colony,² and has been able to direct the course of tariff and land legislation for the benefit of European farmers.³ The Gold Coast affords an example of a somewhat different type. Its history records many cases in which projects of law, some of which were designed to protect the general population against the chiefs, have been abandoned as the result of the opposition of the chiefs' party

¹ See above, p. 165.

² Ibid.; see also Chap. X, pp. 550-1.

³ See Chap. IX, p. 383, and Chap. XII, pp. 742 ff.

in the legislature; some of these have owed their subsequent enactment to the issue of an Order in Council by the Crown. Here also the circumstances were unusual, in that the native policy of the Gold Coast Government was for long marked by a tradition of hesitation and indecision.

The councils in the African colonies and protectorates have halted at a somewhat early stage in the traditional development of the council system. The next stage is normally one in which the council is given an unofficial majority, obtained either by election or by election combined with nomination; here the executive, though retaining the power of veto either directly or by process of 'Reservation of Bills to the Crown', can only secure its own legislation or its budgetary proposals by certain constitutional devices, such as that by which a prescribed number of subjects are reserved for control by executive regulation in place of legislative statute, or that by which the executive is given the power of 'certification' of legislative projects (which then have the force of law in spite of an adverse vote in the legislature) or of 'restoring' demands for supply refused by the legislature. The acceptance of conventions under which special powers of this kind are progressively held in abeyance, until they are ultimately withdrawn from the law of the constitution, marks the course by which a dependency progresses towards responsible self-government. The essence of this constitutional position is the responsibility of the executive to its own legislature; but this may still be accompanied by certain restrictions on the full competence of the legislature; an example of this has been seen in Africa in the reservation of native affairs from the competence of the Southern Rhodesian Chamber,¹ and a similar provision was discussed by the Closer Union Commission as one of the possible conditions on which responsible self-government might be extended to Kenya.²

In discussing the question whether the colonial and protectorate councils are likely to halt permanently at the present stage, or to develop on the lines followed elsewhere, we met with the fact that the political future of the African colonies has never been made the subject of systematic consideration in Great Britain; certainly there is nothing comparable to the deliberations which preceded

¹ See above, pp. 157-8.

² *Report*, op. cit., Cmd. 3234, 1929, pp. 106, 155-6.

the different stages of constitutional change in India. Neither the Covenant of the League nor the Mandates explicitly envisage any one particular form of government as the goal of mandatory rule. Such consideration as has been given to the question by the British government has centred mainly on the problems arising from the existence of British communities in the East African territories. The Secretary of State in 1922 stated that he could not contemplate anything which would prevent Kenya from looking forward 'in the full fruition of time' to responsible self-government';¹ but however encouraging this aspiration was to settlers, it was hardly a considered statement of policy. On the other hand, the White Paper of 1923, which had more of this character, was impressed with the paramount need for safeguarding native interests and regarded the grant of responsible self-government as 'out of the question within any period of time which need now be taken into consideration', and, for the same reason, the government declined to contemplate the possibility of substituting an unofficial for an official majority in the council. The White Paper of 1930 stated that dominion status was the ultimate goal of Kenya, but could not be attained until the native community could participate in self-governing institutions. Useful as was the comprehensive study of political issues in East Africa which was made by the Commission on Closer Union of 1927, neither their report nor the recommendations made on it by the Joint Parliamentary Committee can be said to have done more than reinforce the arguments for maintaining the existing position. The case was in particular strengthened against the concession of an unofficial majority in the legislature. It will be agreed that to create an unofficial majority, while at the same time subjecting its decisions to the overriding control of an official executive, tends to deprive the legislature of much of its value as an organ of public opinion; it is driven by a sense of impotence into an attitude of political irresponsibility; it may be said indeed that the concession of an unofficial majority is only justifiable as marking a temporary stage of which the acknowledged end is responsible self-government.

On the evidence of the constitutional documents available, re-

¹ *The Times*, Jan. 28, 1922.

sponsible self-government would seem to have been tacitly accepted as an ideal, but one which is removed from the field of practical politics owing to the existence of a conflict of interests between the European and the native (or immigrant non-European) populations. But this decision is based on grounds of expediency rather than of logic; in the light of the grant of responsible self-government to Southern Rhodesia it invites the question, what precise ratio of European to native population can be held to justify the concession of responsibility; and the answer given to Kenya would not in any case hold good for other territories, such as some of those in West Africa, where the same conflict between European and native sections of the population cannot be said to exist. If strict logic is applicable in such circumstances, it must be assumed that it is the intention to concede responsible self-government in West Africa when Africans are considered competent to exercise it. They would in that case benefit by the absence, just as East Africa would lose by the presence, of a European community which has brought with it all the traditions of responsible government.

It is not in the British tradition to explore far-reaching constitutional issues until the force of circumstances makes it essential to do so; and it is not reasonable to expect that any government would now enter on an explicit commitment regarding the future status of the African colonies. But there is one reason at least why some further consideration should be given to the question whether a responsible government based on representative institutions is to be held to be the most suitable constitution for the African colonies. It is increasingly clear that Africans must before long be given a material addition to their very limited representation in the legislative councils. There is not in the African Crown Colonies any body similar to the newly constituted Native Council in the Union, which, though it may have only a consultative status, can nevertheless claim to be widely representative.¹ The French administrations have on the whole been more liberal in their provision of advisory bodies than the British. If, however, native representation in the legislative councils is progressively increased, this will stimulate a hope, if it does not convey a promise, that parliamentary

¹ See above, pp. 153-5.

institutions will be allowed to pursue their normal evolution in the African colonies; all experience shows the difficulty of calling a halt when political representation has once become a serious matter of interest. But in the meanwhile Great Britain, in fostering the system of indirect rule, is promoting a widespread agency of local self-government for which a place will eventually have to be found in the political organization of the colonies. As is said elsewhere, there is much that is difficult to foresee in the future of indirect rule;¹ but possibly the most difficult problem of all, is to envisage the feasibility of integrating the system with the normal type of Parliamentary institutions.

It is at this stage difficult to discuss the Belgian outlook on the political future of the Congo, for the development so far attained is not such as to permit of the formulation of a definite policy. As has been seen, decisions have still to be made even on such points as the inclusion of Africans in advisory councils and the like.² On the other hand, French policy is sufficiently clearly defined. Attention has already been drawn to a fact which explains much of the difference between the French and British outlook on the future of their colonies; the French attach to legal and social status the importance which the British give to political rights and freedom in commercial relations. The greatest boon which the British can hold out to a subject people is self-government; the best that the French can envisage for them is admission, in such measure as conditions permit, to the social and cultural institutions of French civilization. All the social activities of the administration are co-ordinated with a logical precision to that end; and it is fully in keeping with that position that the colony should be held liable to contribute to the military resources of France and, when no treaty or other obligations forbid, should be brought within her commercial economy. At the moment there seems no tendency to extend to African *sujets* the privilege of election to the French Chamber, which is now only enjoyed by the *citoyens indigènes français*, a relatively small body whose growth by the process of naturalization is rigidly controlled.³ Save for the existence of this feature in the constitution, a French colonial government may be viewed as a

¹ See Chap. IX, pp. 527 ff.

² See above, pp. 211-12.

³ See above, pp. 195-200.

bureaucracy, dependent on ministerial decree for most of its legislation, admitting coloured *citoyens* to its colonial service and to the rank of officer in the army, and making a wide use of African *sujets* in subordinate employment, but in other respects confining Africans to the membership of advisory bodies. The conception is logical; it does not have to confess, like the British, that circumstances may render it impossible to make further progress in the development of the political system on which its subjects believe it to have embarked. At the moment, French policy seems successful in achieving its more immediate purposes, and its execution is attended with few signs of political discontent. This may, as some critics have suggested, be due partly to the fact that the attitude of the administration on the subject of the press or of public meetings is admittedly less tolerant than in the British territories; it is clearly due also to the care taken to retain the interest of the *élite* and to the fact that the French attitude is less provocative than some others of a sense of social inferiority on the part of the subject race. Nevertheless it cannot be doubted that the French will have to face sooner or later the problem which is the natural outcome of circumstances such as they are creating. With the general growth of education and standards of life, it would be strange if there did not arise among their African subjects a demand for a greater share in the government of their own affairs; and the embarrassment which this will present to France will be increased in proportion to the success which has been achieved in making Africans identify themselves with French civilization. The flexible nature of the British colonial system can possibly accommodate itself to such a demand with less shock than the French system, which is at once more centralized and more rigidly attached to a framework of European institutions.

In the course of the preceding sections of this chapter reference has been made to a number of problems of administration common to the colonizing powers. The degree of initiative enjoyed by the colonial governments,¹ the discretion left by them to their own subordinates,² the method of co-ordinating the work of the general administration with that of its ancillary departments are

¹ See above, pp. 160-3, 185-9, 206-13, and 213-16.

² See above, pp. 163-73, 210-13, and 215-16.

matters which inevitably vary with the type of governmental system in force;¹ the difficulty of securing continuity of local experience among administrative officers is a common problem for which no solution has yet been found. In their recruitment of a colonial administrative service France and Belgium suffered at an earlier stage from the fact that they had not the traditions which attached in Great Britain to service in the dependencies. The type of recruitment is, however, now greatly improved. Both France and Belgium attach greater importance than Great Britain to a specialized training in preparation for service in the colonies, partly for its own sake, and partly because the longer course affords an opportunity to eliminate those who appear unfit for the class of duties they will have to perform. In following its present system, Great Britain possibly secures a wider field of choice, but does so at some loss to the technical efficiency of the recruits to its services.

It remains to notice in more detail a problem of first importance to all three powers, namely, the employment of Africans in the public services. Different considerations apply to employment in the subordinate and in the superior services; the issues which employment in the latter raises are not only administrative but political. It has been considered advisable to give at some length the facts about subordinate employment,² including in that term not only African, but European employees, such as the *agents* of various classes in the French service. It has been justly observed that failure to provide an administrative officer with an adequate subordinate staff not only interferes with his position in the matter of general direction of the administrative activities of his province or district, but also prejudices his influence over the native authorities and makes proper contact with the native people difficult.³ As compared with other administrations, circumstances in the British territories appear to have combined to give the district officer an unusual amount of clerical or routine work, while the subordinate staff supplied to him is markedly inadequate. In the chapter dealing with taxation it will be seen that work in connexion with the collection of tax has in many areas interfered with

¹ See above, pp. 227 ff., 239 ff., and 243 ff.

² See above, pp. 233-5.

³ See Chap. X, p. 559; *Report on the Financial and Economic Position of Basutoland*, Cmd. 4907, 1935, pp. 75-83.

more important duties.¹ In urban or industrial areas, and where a considerable European population exists, time has been occupied with judicial and routine work which has prevented proper contact with the native people.² The explanation perhaps lies in the fact that the British have had an instinctive mistrust of the use of subordinates recruited in Europe, while African subordinates of the requisite quality and number have not yet been available. In British colonies Europeans appear to be employed to any extent in connexion with the administrative staff only in cases where legal work or the presence of a European population necessitates the employment of magistrates' clerks or licensing officers; in Tanganyika, for example, 7 clerks only are employed with an administrative staff of 185, in Northern Rhodesia 36 clerks with an administrative staff of 109, the collection of taxes and the routine work in native areas being left in the hands of junior district officers or cadets. Both the French and Belgians have made a wide use of European subordinates; but in comparing the figures of subordinate European personnel given in Table III included in this chapter with those already given for the Belgian Congo intermediate service, it must be remembered that both the latter service and the corresponding *service civil* in the French territories is recruited in the home countries and is used extensively in the district administrations for work such as the supervision of native chiefs, which in any case would be considered the function of the district officer in British territories. The *agent territorial* in the Congo, and the French equivalent, has to some extent an opportunity of entering the superior administrative cadre, and in French territories, especially in French Equatorial Africa, owing to difficulties in recruiting the *administrateur* class, he often functions as the sole superior government agent in an administrative area. The need of qualified administrative assistance is, of course, specially felt in systems of direct administration, and there is ample evidence of the value attached to the work of the European subordinate staff in both the French and Belgian territories. In the French areas its work has been most conspicuous in the ancillary services;

¹ See Chap., X, p. 601.

² *Report of the Commission to Inquire into the Disturbances in the Copperbelt*, Cmd. 5009, 1935, pp. 40-1.

in the Congo it has also taken an important part in administrative work, and in particular in census and tax proceedings. But there are obvious limits to the use of a European subordinate staff in African conditions. To employ the comparatively cheap agency of the *sous-officier* class involves, as experience has shown, a grave danger of lowering the standards of conduct; the higher class now being recruited, though less costly than the *administrateur* cadre, is still by no means inexpensive. There are certain difficulties which are bound to arise from the employment in colonial conditions of a subordinate service recruited from a social class not markedly differing from that of the administrative service. In the French service there is said to be some discontent regarding pay and promotion to the administrative class, and it is significant that there is a growing opinion in favour of the employment of Africans for clerical work. It is at all events clear, that the growth of a European intermediate service should not be allowed to interfere with the greater need of the development of an African service which will in time assume the burden of the routine work of the administration.

In regard to the employment of Africans experience shows that it is in what has been described as the 'intermediate' rather than in the purely subordinate cadres that the most pressing problems arise. It is to the existence of the former class, with an adequate technical training, and with the standards of conduct necessary for the exercise of responsibility, that administrations must in the future look for the means of expanding the operations of their ancillary services. The chapter on education shows in some detail the efforts being made by the French to train this class in their institutions at Dakar and elsewhere.¹ In the British territories the institutions at Fort Hare, Makerere, and Yaba are designed for the training of this class; Achimota may be said, in part at least, to serve the same end.² There does not seem, however, to be any evidence of a common policy among the British administrations in regard to the use of an 'intermediate' cadre of Africans. The recent Makerere Commission found governments uncertain as to their requirements for trained Africans for employment, and none of the East African governments consulted appeared to

¹ See Chap. XVIII, p. 1267.

² Ibid., pp. 1248 ff.

contemplate the use of any considerable number of Africans from secondary or higher schools in connexion with the administrative services during the next ten years. The greatest demand is 120 secondary-school and 328 higher-college trained Africans for medical work, and 500 secondary-school and 249 higher-college pupils for educational work, and out of a total of 2,066, only 8 are required in connexion with the administrative service.¹ These estimates are admittedly conservative and reflect the doubts of administrations that the educational system will be able to supply any considerable demand in the near future. The problem is largely educational; the provision of secondary education is not yet adequate to create the educated class from which the technical services must be recruited. But, apart from lack of provision for technical training, the matter is also complicated by the reluctance of departments to use agents of whose efficiency they are not yet confident. A longer view would realize that if a satisfactory service of this class ultimately emerges, preliminary failures are of relatively small account.

As the figures quoted above indicate, hesitation is most pronounced in regard to the employment of Africans in the administrative service, save as clerks or in some other subordinate capacity. The 'intermediate' class of employee would here normally take the position of assistant to the District Officer, with lower judicial powers, but a definite, if subordinate, field of executive responsibility. There exist a few instances in which Africans of this class have been employed in the administrative branch, though generally in secretarial and similar employ rather than in district administration. It is often contended that the system of indirect rule both reduces the field for the employment of this class, and creates the special difficulty that tribal authorities would resent the intrusion of Africans belonging to other tribes. The attitude towards this class perhaps owes something also to the influence of the preference for the uneducated over the educated native which is so much more conspicuous in British than in French territories. The problem is far from simple; but those who are aware of the great debt owed by India to its 'provincial' services, will hope that the British administrations in Africa may be able to find a way to make an

¹ *Higher Education in East Africa*, Colonial 142, 1937, p. 23.

equally beneficial use of educated Africans. There appears already to be an opening for this class in dealing with the mixed communities and the natives living in non-tribal conditions who are dealt with in Chapter IX.¹

There remains the question of the employment of Africans in the higher ranks of service. It has been previously remarked that the considerations involved here are of a political rather than an administrative nature. The theory of 'association' has made it relatively easy for the French to contemplate the admission of coloured *citoyens* to their higher administrative service; though the officers of this type now serving in West Africa come mainly from the West Indies, it is to be presumed that a resident of West Africa with the necessary citizen status and educational qualifications would be equally eligible. Educational and other conditions in the Congo are not yet such as to make the matter one of practical interest there. British policy, while acknowledging in principle the value of associating Africans with the machinery of government, has up to the present preferred to seek a solution in their association with the legislature. Many thinkers have also contended that the institutions created under indirect rule, rather than the ranks of the administrative service, provide the true field for higher service by Africans. Here, however, the field must necessarily be limited by the fact that many of the tribal authorities would not welcome the services of Africans not belonging to their own tribe. A few appointments have been made to administrative posts, such as the well-known instance of Mr. Henry Carr, who was about 1919 made Resident of the Colony of Lagos; and Africans have been appointed to judicial posts in the Gold Coast, as well as to the superior establishment in certain of the technical departments.² It would seem, indeed, that the liberal support given by the Gold Coast to Achimota has been due to a belief that the attainment of sufficient academic qualifications would ensure an appointment in the superior services of the Gold Coast government.³ The government itself does not appear, when making the appointments mentioned, to have done so in pursuance of any principle, such for instance as the reservation of a defined

¹ See pp. 496-527.

² See Chap. XVIII, p. 1249.

³ See above, p. 235.

proportion of its higher posts for suitably qualified Africans. It is not perhaps advisable that the pressure from educated Africans in the western coastal areas should be allowed to force a declaration of policy applicable throughout the African colonies; but the position on the West Coast needs to be clarified, and the question of the policy to be followed in the colonial areas generally will before long demand an authoritative decision.

CHAPTER VII

LAW AND JUSTICE

I. THE INTRODUCTION OF A SYSTEM OF LAW

THE introduction into Africa of a system of law, based in the main on European concepts, has brought to light difficulties of adjustment which have rightly engaged the study of the social psychologist; but it has at the same time presented problems in comparative jurisprudence which have received less attention from students in that field. Yet the problems are not new; they have occurred whenever conquering or colonizing nations have faced the need for regulating the legal relations of mixed populations, or for integrating into a legal system the customary law of more primitive peoples. In the history of the diffusion of law in the Roman Empire and in British India there is much that is suggestive to the student of the evolution of law in Africa.¹

At the outset, Rome attempted to confine the operation of her legal system to those who had in her provinces the status of citizens; the 'subjects' were left to the operation of their own courts where such existed, as in Sicily or Greece, or to regulation by tribal custom in more backward areas. Gradually, however, Rome had to face the action of the forces she was bringing into play. In the more civilized areas there was a large growth in the numbers admitted to citizenship, and an increasing tendency for the administration to pervade the whole public life of the province; in the more backward, some remedy had to be found for the repugnance between tribal observances and civilized concepts. In the metropolis the law had, from about the third century B.C., been gradually modified by praetorian edicts to meet the needs of an expanding society; in the provinces the governor began to regulate by his own edict the law in mixed cases between citizens and aliens, and to issue orders regarding the procedure of criminal law in the alien courts. During the three formative centuries, 150 B.C. to A.D. 150, the metropolitan law gradually expanded until it became more suitable to the needs of the Empire at large;

¹ J. Bryce, *The Roman and the British Empires*, 1914, Essay II.

the provincial law, by a process of absorption, began to draw nearer to that of the metropolis. The law of property and contract, the penal laws and the system of legal procedure were practically identical; but family relations and inheritance were still regulated by the customary law. In the third century A.D. the legal distinction between citizens and aliens vanished with the grant of full citizenship to all subjects of the Empire. The effect was not at first to supersede the customary law peculiar to certain provinces. Even when imperial legislation took a new and vigorous form, under the unifying and pervasive influence of Christianity, and codification had been completed in the reign of Justinian, local variations persisted.

The evolution of a system of law in British India moved in another direction, determined as much by diversity of environment as by difference of objective. The British had no large class of their own citizens to consider; on the other hand, they encountered a civilization which was shared by a greater mass of people and was more tenacious of its custom than any with which the Romans had to reckon. To the English in the days of Clive and Warren Hastings, India appeared to be already regulated by Hindu and Moslem law, which they viewed as developed systems. In effect, however, the law in use consisted of mixed elements. There was an elaborate procedure of inheritance and family law, the Moslem uniform, the Hindu much diversified, but both based on writings and text-books having religious authority; there was a body of readily ascertained custom relating to land; and finally, there were certain penal rules drawn from Moslem law and generally enforced throughout what then remained of the Mogul Empire. To these conditions it was impossible to apply the English common law of the day, and the early administrators carried on what they found, applying English law to the English and Indian law to the Indians. Gradually, however, it was found necessary to regularize the law of procedure and the law of crimes; in particular, the penal law of the Moslem courts contained provisions which it was difficult for the government to enforce. The tentative beginnings of a more regular system of legal procedure were extended in the rule of Amherst and Bentinck (1823-35), a period when the spirit of legal reform inspired by Bentham was on foot in England.

There were two noticeable features in this process. The administration preferred to issue local regulations, suited to Indian conditions, rather than to reproduce the forms of English law. Secondly, all law, including native customary law, was administered through the regular tribunals, a process rendered easier by the fact that the subordinate personnel of the judiciary was Indian; no special courts were instituted for administering native law. The Indian Law Commissions of 1833, 1853, and 1861 laid the foundations of a uniform system of codified law, including that of crimes, criminal and civil procedure, evidence, contract, and the like. In drawing up these codes the conceptions of English law prevailed, though the form was adapted to Indian conditions; but codification left untouched the body of family law and the law of inheritance, while land tenures, being subject only to legislation in the provinces, retained their local characteristics. If the customary law has been regularized, it is owing to the study which has been given to it in Indian text-books, or to the fact that it has been administered by the same courts as the statutory law.

Expressed in the briefest terms, the chief problem of Rome was one of assimilation, and the Latin mind has tended to regard identity of legal rights as a more important element in assimilation than equality of political powers. The problem of the British was primarily to find a system of law which would avoid emphasizing to India the fact that it was passing under the dominion of a power professing an alien faith. Strongly therefore as they were impressed with the value of a uniform system of law, they were equally strongly moved by the need for maintaining the customary laws based on the social and religious life of India.

The student of jurisprudence who seeks to add to the history of law in the Roman and British Indian empires a chapter tracing its development in Africa will have this advantage—that he will have before his eyes a living process; and his study will possess a value for the lawgiver which no historical retrospect can supply. But his view of this development will also be influenced by a factor of which neither the Romans nor the earlier administrators in India were conscious. Legislation has now become the means of expressing the changes which a community deems best suited to

improve its social and material life; in Africa, the law imposed by the European powers is passing beyond its rudimentary purpose as an instrument for securing order, or maintaining existing social relations, and is entering on a more extended phase, requiring the enactment of a wide range of laws necessitated by new conditions.

The chief problems of legislation in Africa still lie, however, in the provision of a law of crimes, of rules of judicial procedure, and a simple form of procedure regulating commercial transactions, for it is common ground that at the outset anything beyond this must continue to be regulated by custom. Yet even here the lawgiver will have to ask himself if the law he introduces is so far alien to all the motives and associations which regulate the behaviour of the people affected as to fail to secure an instinctive respect from them. The modern conception of the function of law realizes that its process cannot be purely authoritarian; it obtains its most effective sanctions not from imposed obedience, but by evoking some answering contribution from those to whom it is applied. There are, moreover, many who believe that we ought not to limit ourselves to this obvious precaution against maladjustment. It is not, in their view, merely a question of making it easier for the lawgiver to secure obedience for his law. They would hold that whatever the value of African conceptions and practices as the basis of a system of regularized law in the European sense, they have a positive value as the expression of the forces which regulate African conduct, and that we ought to begin rather by inquiring how far we can use them as part of the foundation on which new African institutions can be built up. It is the same feeling as that which has inspired the larger use of native authorities as part of the executive administration.¹

Whichever view is taken, a knowledge of the background against which the lawgiver has to operate must have a definite value for him. There was a time when the study of the African's law or custom seemed to have little contribution to make to those who had to legislate for him, and the systems observed were thought to be so alien to European concepts as to disclose little of what, on the Austinian analysis then in vogue, seemed to be the essential

¹ See Chap. IX, pp. 527 ff.

characteristics of law. Later students have realized that Africa to-day is in one of the stages which at different times must have marked the development of law elsewhere. Changes in law and custom are closely parallel to changes in material culture; and in African observances we seem to be able to recognize definite stages accompanying the evolution of the hunting into the pastoral life, or the beginnings of agricultural settlement. The law of the ancient Babylonians, Hebrews, Romans, and Saxons had close analogies to what we see among the more primitive of the African peoples.¹ If there is any peculiarity in African legal institutions it is less one of intrinsic character than of the time at which they present themselves, for they exhibit to the modern world some of the scenes in a story which must have been enacted 5,000 years ago in parts of Mesopotamia, and at later dates in Rome, Germany, and Britain.

The nature of primitive law, in Africa as elsewhere, is still a controversial subject.² Its primary object has, however, been well defined as the desire to maintain social equilibrium, and its remedies are intended to restore any disturbance of that equilibrium. This accounts for its apparent deficiency on the penal or deterrent side, and in so far as it often treats offences as matters for compensation, for its peculiar manner of discriminating between crimes against society and wrongs against the individual. Here once more we have a familiar stage in the history of law; indeed, the process by which civil wrongs are turned into criminal offences is a development which accompanies the advance into a more complex political order. It is at the same time a fact that African law is not entirely wanting in some element of public law, since certain offences, such as treason to a chief, witchcraft or incest, as well as certain non-intentional offences (such as the production of twins) are in many cases treated as injuries to the community, and are met by the only remedy which can protect the unit, namely, the elimination of the offender by banishment or death.

¹ A. S. Diamond, *Primitive Law*, 1935, p. 174.

² J. H. Ariberg, 'The African conception of Law', *Journal of Comparative Legislation and International Law*, Nov. 1934; A. R. Radcliffe-Brown, 'Primitive Law', *Encyclopaedia of the Social Sciences*, vol. ix, 1933, p. 202; B. Malinowski Introduction to H. I. Hogbin, *Law and Order in Polynesia*, 1934; W. Seagle, 'Primitive Law and Professor Malinowski', *American Anthropologist*, vol. xxxix, part ii, 1937, pp. 275-90.

There is a further characteristic in which African law is different from European systems. It does not exhibit those sanctions which are so conspicuous in modern European life, the police force, the prison, or the processes for executing civil decrees. To some extent the necessity for securing obedience to law by penal sanctions is reduced by the fact that law represents not the act of a sovereign but the belief and practice of a community. It is no doubt as true of the African as it is of people in other stages of development, that most men obey the rules of society partly because they take them for granted, and partly because obedience pays;¹ but though this incentive would go a considerable part of the way, it cannot cover the whole field; there remains the problem of compliance where it is unduly irksome, or where individual character is strongly resistant. Here, two sanctions operate with exceptional force in Africa. The first is based on the sense that the law has the support, not only of the living community, but of its ancestors, who have power to avenge breaches of traditional discipline of which the African sees constant proofs in the events of everyday life. Moreover, the ancestral resentment of a breach may extend to the group, and it is in the interest of each member to avert it. There is thus a collective responsibility built on a potent spiritual belief. Somewhat akin to this, in that it can operate without the aid of extraneous authority, is the sanction derived from invoking the aid of magic to detect and sometimes to afflict an evil-doer. The effect of this is automatic and the firm belief in it affords a strong restraint on law-breaking.

It is possible that religious, magical, or social sanctions may have had a similar force in other civilizations at the stages of their material development corresponding to those of Africa, but there is certainly one feature in the African picture as seen to-day that must be unique. The strength with which new forces from many angles are playing on African social institutions can have no parallel in history. The lawgiver has to deal with social factors which are rapidly altering in the face of new conditions, and he has to find new sanctions which will take the place of the old. The very intensity of the feelings which gave them their force will deepen the gulf which their disappearance will cause.

¹ L. P. Mair, *Native Policies in Africa*, 1936, p. 271.

II. THE SOURCES OF LAW AND ITS GENERAL CHARACTER

The Union of South Africa is in its legislative as in its executive capacity now independent of any external control.¹ It is also characteristic of the Union that it is one of the heirs to the tradition of Roman law. The Roman-Dutch law which the first colonists brought with them was, however, rapidly permeated by the English common law. As early as 1827 the Charter of Justice introduced the jury system and brought the law of evidence into harmony with English law; henceforth the law in its procedural aspect (and it is the procedure of the tribunals rather than the principles of the law that gives it its character in the eyes of the population at large) became largely English. The question whether the Union should codify that Roman-Dutch and English common law which has so far escaped inclusion in the statute law is of juridical rather than of popular interest. The examples of codification in Ceylon and British Guiana hardly afford a precedent which a country with so carefully elaborated a system as the Union could be expected to accept as a guide.

The general character of the Union law is predominantly that of a system framed for the needs of a white population; the needs arising from the existence of a large African population have been met by the enactment of special laws relating to them rather than by a modification of the general body of law. There are at least thirty-five Acts which specially or differentially affect natives.² Since the law has been concerned primarily with the needs of the European community, the recognition of native customary law as part of the general body of law has come late and haltingly. The early lawgivers in the Cape evinced great reluctance to face the legal consequences of the absorption of the native people in their area. In theory the civil law of the Cape was applied to them, but in practice the magistrates were driven to disregard the law and to apply native custom, and the extra-legal native court at King William's town was a marked, if an anomalous, feature of the Cape system. It was only the special circumstances of the

¹ See Chap. VI, pp. 144-6. A. Berriedale Keith, *The Governments of the British Empire*, 1935, p. 49.

² E. H. Brookes, *The Colour Problems of South Africa*, 1934, pp. 202-4. See Chap. IX, p. 348.

Transkeian territories which compelled the Cape to make provision in 1879-94 for the application of native law to them.¹ In Natal, on the other hand, recognition of Bantu law had been one of the points of the Shepstone policy,² and this was formally accepted in an Ordinance of 1847. A codification of the native law of Natal was made in 1878 and was issued as a schedule to Law 19 of 1891. The recognition in the Transvaal and in the Orange Free State was strictly limited. As a result the most embarrassing legal situations constantly arose; thus as late as 1910 the Supreme Court of the Transvaal held that the children of native customary unions were illegitimate,³ and in another case in 1915 the court refused to recognize native customary law regarding the status of women;⁴ in the Cape Province in 1893, the Supreme Court of the Cape Province stated that the courts of law were bound, however much they might regret it, to treat intercourse between parties to a native marriage as 'illicit', and even in the purely native district of Glen Grey native customary marriages were ruled to be 'not immoral but illicit'.⁵

It was therefore a definite advance when section 11 of the Native Administration Act of 1927 gave a statutory recognition to native law in all provinces of the Union. It must be noted at the same time that this measure, in harmony with the political objective of segregation, was directed less to the maintenance of native law than to differentiating its field. Though it enables some provision to be made for dealing on uniform lines with cases involving questions of native custom, the Statute still leaves indefinite the position which native law is to occupy. It appears that it is open to the discretion of the courts to apply native law in civil cases even in the absence of statutory authority, wherever it satisfies the tests required under English and Roman-Dutch law for the recognition of local custom.⁶ It seems unlikely, however, that native law, other than that contained in statutes, will be applied to any appreciable

⁶ J. Lcwin, 'The Recognition of Native Law and Custom in British Africa', *Journal of Comparative Legislation and International Law*, third series, vol. xx, Feb. 1938, part i, pp. 16-23.

extent where no special courts for natives have been created, as for instance in the major part of the Orange Free State and of the Cape. Perhaps the most urgent need in defining the field in which native law should be applied is in connexion with the provision¹ of letters of exemption to individual natives. If such letters were held by all Africans to whom native law can no longer be appropriately applied, the courts would be greatly assisted in applying the law which is just in each individual case. The rigid code in Natal makes exemptions imperative if real hardship is to be avoided. The customary law applicable in Natal is that contained in the Proclamation, no. 168, of 1932 which was based on the Natal Code of 1878 and the subsequent law of 1891: elsewhere it is the unwritten native law, as discovered from assessors, reported cases, text-books, and the like. On the criminal side, the native comes under the ordinary law, as extended by the body of differential statutes already referred to; he comes under native law only in so far as he commits an offence which is triable in a chief's court having criminal jurisdiction. Thus in Natal the Code of 1932 penalizes breaches of orders issued by chiefs, and the seduction of unmarried women, which would not be offences against statutory law.

In Southern Rhodesia the Roman-Dutch system was introduced by the Order in Council of 1898, which laid down that the law to be applied should be the same as that in force in the Cape Colony on June 10, 1891. Here, however, even greater inroads than in the Union have been made upon the system by local legislation and the adoption of English legal principles, as, for example, in such matters as arbitration, water rights, and community of property between married persons. In adjusting the law to modern conditions, Southern Rhodesia has been guided chiefly by legislation in the Union, whose most important enactments it has taken over in a modified form; an additional factor making for uniformity between the two territories is that appeals from the Southern Rhodesia Supreme Court are taken to the Appellate Division in the Union. As regards native law, the need for recognizing and maintaining it was acknowledged from the outset; the charter of the British South Africa Company prescribed respect for the native

¹ Native Administration Act 1927 (as amended 1929), sect. 31.

law of property, family, and personal rights; the Order in Council of 1891 contained a similar injunction; and the Order in Council of 1898 directed that in civil cases between natives the courts should apply native law so far as it was not repugnant to justice or morality, or any enactment in force. In effect natives are subject to the European criminal law, while in other respects the customary law has been considerably changed by enactments intended to eliminate what was thought undesirable, or to regulate the conditions created by the interrelationship of native and European law.¹ The Order in Council of 1898 and the Letters Patent of 1923 sought to control differential legislation by providing that without the consent of the Secretary of State disabilities could not be imposed on the native population alone.² Nevertheless, a large number of statutes make separate provision for natives in such matters as labour, residence, land, and the marketing of agricultural produce.

Passing to the British colonies and protectorates, it is necessary to premise that there is no logically clear distinction between the colony and the protectorate; the status of different areas has often been determined rather by historical accident than by legal theory.³ From the juristic point of view the distinction lies in the fact that the colony is in a full sense part of the possessions of the Crown, whereas the protectorate is a British possession only for international purposes.⁴ The original or basic law in territory which has become a British colony by settlement is the common law and equity, and the statutes of general application which were in force in England at the time the administration was created. In this sense the Englishman carries his own law with him. Where, however, in conquered or ceded territory, an administration existed before the country became a British colony, the previously existing law remains in force until modified by legislation.

In protectorates the same general principles have been widely applied by the original Orders in Council, and they would be applied by the courts to protectorates as to colonies. In the West

¹ See Chap. IX, pp. 376-82.

² See Chap. IX, p. 377.

³ A. Berriedale Keith, *op. cit.*, p. 463.

⁴ M. F. Lindley, *The Acquisition and Government of Backward Territories in International Law*, 1926, p. 183.

African protectorates 'English law has been assumed as the basis of law', and in the East African protectorates 'the principle was adopted of applying English common law, equity, and statutes of general application . . . and a like rule has been applied to Tanganyika'.¹ Where 'internal sovereignty gradually passes to the protecting power'² it becomes extremely difficult to draw a line between a protectorate and a colony.³ Nevertheless, the distinction is important in so far as the natives of British colonies are British subjects, whereas the natives of a protectorate are not full British subjects, and have not the rights of British subjects in the King's dominions. The appeal to the Privy Council can be made, as of right, by the natives of colonies and by the natives of those protectorates to which this right has been extended by Order in Council or by local legislation. Where this has not been done, appeal may be made only when leave is granted.⁴

Almost from the first the tendency was to meet the expanding needs of the colonies and protectorates not by extending to them imperial legislation, but by local regulation, which, as the dependencies came to be endowed with legislatures, took the form of local legislation. The great body of law in the British dependencies is therefore that secured by local legislation; what has been described above as basic or original law remains rather as providing guiding principles than substantive law. The power of legislation in colonies was itself based either on the prerogative right of the Crown to assign the form of government in a conquered or ceded area (as in Ashanti or Basutoland), or on the general authority which the Crown acquired under the British Settlements Act 1887 to establish a legislature in any British settlement. The setting up of legislatures in the Gold Coast and Sierra Leone is typical of the latter class of cases. In some territories, such as Northern Nigeria, the Crown legislates through the officer administering the government; but most African colonies now have legislative councils, variously constituted;⁵ the variety of their constitution is not reflected in any difference in their powers, which are

¹ A. Berriedale Keith in Halsbury, *Laws of England*, Hailsham ed. 1933, vol. xi, p. 245.

⁴ *Jerusalem-Jaffa District Governor v. Suleiman Murra* (1926), A.C. 321.

⁵ See Chap. VI, pp. 163-73.

uniformly unlimited in scope, save for the absence of any constituent authority. Control from England is secured by consultation between the Governor and the Secretary of State before important legislation is introduced, by the power reserved to the Crown to disallow any act of a colonial legislature, and further by a constitutional provision that in certain classes of bills the Governor shall not give his assent to an act as passed by the legislature without previous reference to the Secretary of State. Reports on all developments of policy must be submitted, and copies of all laws passed sent home with a report explaining their provisions, and a statement from the law officer to the effect that in his opinion the assent of the Governor may or may not be properly given thereto.¹

At the same time, the Crown retains to itself an important right, namely, to legislate in any area by its own Order in Council, in order to provide for cases in which local legislation cannot be secured without undue resentment or legal difficulty. We have thus three sources of law: first the old law of the colony, i.e. common law, though this has largely been modified or replaced by local legislation; second, local legislation either in the form of Acts of the local legislatures (which now comprise the great bulk of the body of the law) or Orders in Council, which are comparatively rarely used, or ordinances and proclamations of the Governor where this method is adopted in the absence of a legislature; and third, Acts of the Imperial Parliament. Though the Imperial Parliament retains unimpaired its right to legislate for any colony, that power is very seldom used, and on subjects of general concern the imperial enactment is if necessary extended to the colony by Order in Council, or in some cases the local legislature adopts the provisions of the imperial act.

In the protectorates law is based on the use of power derived from the Foreign Jurisdiction Act, 1890.² This gives the Crown almost unfettered authority; Orders in Council have full validity save in so far as they may be repugnant to any Acts of Parliament especially extended to the protectorates. The power of the Crown in legislation is absolute. The position in regard to agreements with native rulers is important. Since they were made by people

¹ Colonial Regulations nos. 153, 156.

² A. Berriedale Keith, *op. cit.*, p. 499.

subsequently brought under protection, they cannot be allowed international force. But since the natives of protectorates are not subjects of the Crown, and therefore in any suit against the Crown would seem to have only the status of foreign persons, such agreements cannot be held by the courts to have force where they conflict with subsequent legislation,¹ and it is probable that the Crown could not be sued on such agreements.² Under power given by the Foreign Jurisdiction Act the Crown may by Order in Council create a legislative authority, as has been done in Nigeria, or may authorize the Governor to issue ordinances, as for instance in the Northern Territories of the Gold Coast, or the High Commissioner to issue proclamations, as in Bechuanaland; in all three cases legislation is controlled in the same manner as in the colonies. The sources of law in the protectorates are thus the Orders in Council issued under the Foreign Jurisdiction Act, and the Acts of legislatures created under that Act, or Governor's ordinances where no legislature exists. We are not concerned here with the question of where sovereignty may be said to lie in the case of the mandates; the basis of the law actually prevailing in mandated territories is in essence the same as in the protectorates.³

The law of the colonies, protectorates, and mandates displays certain characteristics, due largely to the influence of the English law, apart from the adaptation of much of the English substantive law or its procedure. Thus the 'rule of law' is maintained in the sense that the executive is not assumed to have any powers, prerogative or otherwise, entitling it to take action against individual liberty or property, which is not covered by statute or common law. To this rule the possibility of pleading the defence of Acts of State for torts committed in protectorates must apparently be admitted as an exception.⁴ Though the colonial laws may give certain limited protection to officials in discharge of their duties, similar to that given in England,⁵ or by grant of partial indemnity from effect of suits, there is a uniform rule of law that administra-

⁵ Public Authorities Protection Act, 1893 (56 and 57 Victoria).

tive actions are judged by the ordinary courts. It is also rare to give to the executive authority power to fine or imprison without resort to judicial process.

In another respect, the English system has a feature not so far shared by others. It admits of the growth of subordinate legislation by native authorities, who have been given the power of making rules to the breach of which penalties attach. The nature of these rules is more fully explained elsewhere;¹ but the rules must be regarded as creating an addition to the general body of colonial or protectorate law.

The general aim of legislation in British colonies may be said to be directed towards producing a common body of law which is expressed as applicable both to Europeans and Africans. Differential or discriminatory legislation is infrequent, and only takes a pronounced shape in areas in which white interests are strong, as in Kenya; but while the general effect has been to produce a body of law common to both Europeans and Africans, it was from the first recognized that this could not cover the whole ground; in particular it could not regulate the inheritance, marriage, and similar relations of Africans living under their own customs. It is probable that, as the early administrators saw the picture, matters falling within the field of civil relations, and possibly also the bulk of the minor criminal offences (including offences against native custom) would be regulated by the chiefs, leaving the more serious crime, and the breaches of administrative law or regulation, to be dealt with by the statute law and by the colonial courts. The earlier Orders in Council contemplated that these courts should decide cases in which natives were parties 'according to substantial justice without undue regard to technicalities of procedure and without undue delay'. They further provided that 'in all cases civil and criminal in which natives are parties every court shall be guided by native law so far as it is applicable and is not repugnant to justice or morality or inconsistent with any Order in Council or Ordinance'.² That general prescription reappeared in a more definite form in many of the laws defining the jurisdiction of the courts; thus the law of the Gold Coast and of Northern Rhodesia provides that 'nothing shall deprive any person of the

¹ See Chap. IX, *passim*.

² Uganda, Order in Council, 1902.

benefit of any native customary law . . . such native customary law or custom not being repugnant to natural justice, equity, or good conscience, nor incompatible either directly or by necessary implication with any law for the time being in force'.¹ Those provisions, however, left a wide field of uncertainty as to the exact law which might be applied in any particular case.

The position, indeed, was more than one of uncertainty. If in a few instances, as in the Gold Coast, the trial by the British courts of certain prominent types of cases led to the growth of a case law based on native law, elsewhere native law remained for the most part outside the regular legal system. The position has in great measure been met by the recognition of native courts as part of the judicial system, under the policy of indirect rule, a step which may be regarded as the effective integration of native law into the general system. The native courts now dispose of a growing body of litigation and apply to it the native customary law, subject to the repugnancy conditions.² Where their decisions come up in revision or appeal to administrative officers or appeal to the courts with European personnel, native law is again applied. This in effect brings into the general body of law all that unwritten native law which deals with land, inheritance, family relations and the like; and also adds to the criminal law a number of offences in the shape of actions violating tribal custom, which would not be classed as offences under English law.

The source of much of the law now in force in the French African colonies has been a matter of juridical controversy,³ but the operation of the present system, which has been described elsewhere,⁴ is clear. The law itself is characterized by the recognition of two classes of rights, the rights of citizens, who are justiciable under the *justice française*, and those of subjects, who are justiciable under the *justice indigène*. The citizen status is shared by some Africans⁵ and also strangers who in their own countries have European or similar status.⁶ Persons coming under the *justice*

⁵ See Chap. VI, pp. 194-200.

⁶ P. Darest, *Traité de droit colonial*, 1931, vol. i, p. 268.

française are regulated by the French *Code Civile*, *Code de Commerce*, *Code Pénal*, and similar metropolitan laws, modified where necessary to suit colonial conditions,¹ and are justiciable by courts of justice which are constituted on the metropolitan model as nearly as local circumstances permit; the most significant difference is the substitution of judges and assessors for the jury system, and the admission of administrative officers to act as *juges de paix*.²

Africans are regulated by native law and custom and are justiciable by native tribunals—a term which has not the same connotation as in British territory.³ The operative provision of law under which native law and custom is recognized is that which defines the jurisdiction of the native tribunals. This⁴ declares that in all civil and commercial matters the customary law of the parties shall be applied; and that in criminal matters the courts ‘s’inspirent de la coutume du lieu de l’infraction, aussi bien pour déterminer les faits répressibles judiciairement que pour déterminer la gravité de la sentence, dans la mesure où il n’en doit résulter aucune atteinte à l’ordre public’. The term *ordre public* has acquired a technical sense as expressing the ideal of civilization subject to colonial conditions.⁵ The significance of the provision quoted, however, is that offences of any degree of gravity, including those for which provision would elsewhere be made by statutory law, are decided by native law. There is therefore so far as the African is concerned no statutory code of crimes or of criminal procedure. Native tribunals are bound by statutory law only in respect of the special enactment against slavery and cannibalism. So far then as the statutory law is concerned, it is largely designed for the regulation of the non-native, the native being justiciable only by native tribunals.

The colonial law shares with the French law the principle of the *droit administratif*; that is to say, that though the ordinary courts can question the legal validity of an *arrêté*, administrative actions as such are judged not by the ordinary courts, but by a special administrative court.⁶ In actual practice the *droit administratif*, in the form it has assumed in modern French law,

is surrounded by safeguards which make its exercise far less of an invasion of private rights than is often supposed.¹ In addition the existence of the *régime disciplinaire de l'indigénat* gives the executive a wide power of inflicting extra-judicial punishment.² Its operation is limited to non-citizens, and can be applied to any breach of regulation declared by local *arrêté* to be an offence. Thus the *arrêté* of 1924 relating to the French Cameroons enumerates thirty-four *infractions spéciales* ranging from acts of disorder to delay in payment of tax. The maximum penalty which can be inflicted is fifteen days' imprisonment or a fine of 100 francs. French authorities have themselves recognized that the provision is of an abnormal nature; there have been occasions on which it has been described as only a temporary measure. The tendency of recent years has been to reduce the number of offences to which it applies, to restrict the maximum penalty in more progressive areas, and to extend the list of Africans exempted from its operation on account of their social rank or the like. In the greater part of French West Africa the maximum penalty is now only five days. There is also evidence to show that in some areas the use made of the system is very carefully supervised, all cases being reported to head-quarters; it is, however, proper to add that there are other areas in which its use is uncontrolled, and seems to extend beyond the limits assigned to it in the regulations. The extension of the *indigénat* to cover internment up to ten years in the case of persons guilty of acts compromising public safety, for which provision has been made in Togo and the French Cameroons, is an unusual measure applying to exceptional circumstances, and has its parallels elsewhere.

The sources of law in the Belgian territories have been described above.³ At the outset policy seems to have been directed by the view that the statutory law, based on the Belgian model, could become the prevailing law applying to all classes. It would regulate the civil rights of Belgians, strangers, and *immatriculés*. Africans would be regulated by native customary law, so far as it was not inconsistent with legislation or *l'ordre public*, but *immatriculation*⁴ would provide an avenue by which perhaps the majority of the

¹ See M. Nagendranath Ghose, *Comparative Administrative Law*, 1919.

⁴ *Ibid.*, p. 212. See also Decree of May 4, 1895, and *Arrêté* of May 18, 1900, in *Codes et lois du Congo belge*, pp. 526 and 1307.

African population would in time be absorbed within the range of civilized law. The process of *immatriculation* has, however, been slow, and present policy, influenced by the growth of the view which emphasizes the value of utilizing native institutions, points to the recognition of the importance of native law. It looks rather to the gradual assimilation of native law to civilized conceptions and practice, than to an early absorption of Africans within the range of the statutory law. The old policy of *immatriculation* has so far lost its force that when the native courts were instituted in 1926, even Africans who were *immatriculés* were made subject to them. In the Congo, as elsewhere, the institution of native courts, properly so called, has given a new position to native law. For civil purposes the African comes under his own law, and this now becomes part of the general law, in so far that the decisions of the native court form part of the recognized judicial process. The native law applied is of course subject to the condition of repugnancy to *l'ordre public*. For criminal purposes Africans are regulated by the Penal Code and Code of Criminal Procedure, as administered by the Belgian courts in the colony. Native courts are, as far as possible, restricted from trying cases which come under the Penal Code, but as the distinction between civil and criminal matters is not always clear to the native courts, many cases are disposed of by them which might otherwise have been held to come under the Penal Code. The constitution of the native courts extends the scope of the criminal law where Africans are concerned, in that the native courts are allowed to take cognizance of offences against native law which are not within the scope of the written law; but offences against the state, breaches of administrative regulations, and the more serious criminal offences always come for trial under the regular criminal law.

There is therefore considerable difference in principle between the French and Belgian systems. The Belgian differs further from the French, in that it does not recognize the system of 'disciplinary penalties' or *indigénat*. It is to be noted, however, that the decree of 1918 (applicable to Africans only) which provides a penalty up to seven days' imprisonment for 'infractions à des mesures d'ordre général'¹ supplies to some extent the place of the *indigénat* in

¹ *Codes et lois du Congo belge*, p. 742.

French territories. It is applicable to any action in contempt of authority, and has been given a very wide interpretation. It differs from the *indigénat* in that punishment follows a judicial process; in effect, since the administrator can deal himself with the case in his quality of a police magistrate, its difference is not great.

The processes of legislation in the Portuguese colonies have also been described in Chapter VI.¹ A decree of 1920 made provision for the codification of native customary law and in 1929 a series of statutes was issued defining the political, civil, and criminal status of Africans. These aim at bringing them under their own law to be administered in special courts. Africans who have adopted European standards of living fall under the same legislation as is applied to Portuguese subjects.²

At this point, there is one outstanding feature which calls for comment, namely, the diversity of method by which legislation is obtained. In the British colonies, where the use of the Order in Council is now the exception, the bulk of legislation is passed after discussion in local legislatures, and the same is true of many protectorates. The composition of the legislatures may not give representation to the majority of the population in the technical sense; but discussion has the material advantage that it enables (and on some occasions compels) the lawgiver to take account of the views of persons capable of expressing the feelings of the majority. The French and Belgian system of legislating by ministerial decree has the advantages of elasticity and dispatch; but French authorities have themselves criticized the system as something of an anachronism in modern conditions. The remarks of M. Paul Leroy-Beaulieu³ referred perhaps in particular to those French colonies which have representation in the French Parliament, but they have also a general application: 'C'est un empiétement du pouvoir exécutif sur les attributions essentielles de la représentation du peuple; il a pour conséquence, en outre, de faire artificiellement le silence autour des questions coloniales, de les enterrer sans bruit.' Belgian writers have also criticized the system as

¹ p. 213.

³ P. Leroy-Beaulieu, *De la colonisation chez les peuples modernes*, 1908, vol. ii, p. 670, and S. H. Roberts, *op. cit.*, vol. i, p. 153.

applied to the Belgian Congo, on the ground that it withdraws initiative from colonial authorities;¹ at all events it seems to make initiative depend on the personal relations between the Ministry and the Governor-General. The remedy suggested is the resumption by Parliament of its full responsibility for legislation followed by a delegation of defined legislative power to local authorities. The solution must perhaps await a change in policy which would make possible the creation of some form of local legislatures.

It is a secondary consideration, though one that may appeal to the jurist, that the British system leads to what appears to be an unnecessary lack of uniformity in the law as between territories similarly placed. It must be remembered that the statutory law hardly touches the field of family relations, inheritance, or tenure of land, where local circumstances would normally be reflected in variety of law. Certain efforts have been made to introduce something of a common form. At the outset the East African colonies secured some measure of uniformity by adopting certain of the Indian codes; some of these have now been replaced by local Acts, which have followed the form of models drawn up by the British Colonial Office. A far greater measure of general uniformity could however be attained in the ordinary law, as apart from the law of family relations and the like.

There is one other point worthy of note. The British method of publishing laws and local regulations gives them in an accessible form, but the French decrees and local regulations are not issued in a form easily available to the public. The failure to publish them in a consolidated form results, as French authorities themselves complain, in much confusion and in frequent doubts as to jurisdiction.²

III. THE ADMINISTRATION OF JUSTICE

In the present circumstances of Africa the procedure of the law and the machinery for the administration of justice are matters of greater interest to the population, and affect its respect for law more vitally, than any matter of legal principle. Throughout the different territories there is a variety of practice which it would

¹ P. Ryckmans, *La politique coloniale*, 1933, pp. 21-2.

² S. H. Roberts, *op. cit.*, vol. i, pp. 152 ff.

be impossible to describe in detail; but it is necessary to summarize its main features.

Taking the Union first, the machinery for the administration of justice presents the picture of a superior judiciary thoroughly organized; it has the Supreme Court for the whole Union, constituted under sections 95-112 of the South Africa Act, with a strong appellate division, a provincial division for each of the four provinces and three additional local divisions. These courts are recruited from 'professional' sources, and are of standing and independence. In addition, the Native High Court of Natal has been retained as a permanent criminal court, but unlike the other courts, the judges are not necessarily professional but rank as civil servants: Act 49 of 1898, however, provides that at least one judge shall have been an advocate.

The subordinate judiciary retains something of its original character as part of the general administration. The magistrates, who have civil as well as criminal jurisdiction,¹ are members of a civil service discharging both administrative and judicial functions. The system by which magisterial functions are exercised by officers of the Department of Justice or the Native Affairs Department, according as the population of the district concerned is predominantly native or European, is discussed elsewhere.²

Save for the limited extent to which the chiefs' courts (which will be subsequently described) dispose of minor criminal cases, the native population is regulated by the ordinary criminal law of the Union as administered by the courts described above. It meets here certain obvious difficulties. One is due to the fact that natives are not eligible to serve on juries. In 1917, it is true, the right was accorded to accused persons of claiming to be tried by a judge with assessors, instead of by jury;³ but non-Europeans were seldom aware of their rights in the matter, and jury trials continued to be the rule. Since 1935 accused persons have had the option of trial by a judge without a jury (the judge may summon assessors), and the Minister of Justice has power, in cases of alleged offences by non-Europeans against Europeans, or

¹ See Act 32 of 1917 as amended by 39 of 1926.

² See Chap. IX, p. 368.

³ Criminal Procedure and Evidence Act 31 of 1917, sect. 216.

by Europeans against non-Europeans, to direct that the trial shall be by a judge without a jury.¹

A further difficulty is inherent in the machinery of justice rather than the law itself. The Union does not prescribe for magistrates any standard of knowledge of the vernacular; there is a wide use of interpreters, often Europeans of no great capacity. Further, there is evidence that magistrates trying certain classes of cases, notably stock theft, are at times exposed to considerable public pressure—a position which might perhaps be less difficult for them if they belonged to a cadre controlled by the Supreme Court. Much of the work of magistrates, where natives are concerned, consists in trial of the offences growing out of special laws applicable to natives. The proportion of natives charged with offences classified as 'serious' was in 1936 some 5.06 per cent. of the total native cases before the courts against a proportion of 2.65 per cent. in the case of Europeans, the number of stock thefts among natives accounting to a great extent for the difference. The large number of cases coming under the special laws, such as illegal possession of native liquor (70,957), Native Pass Laws (63,149) and Native Taxation Act (63,072),² illustrates the point made by General Smuts, as Minister of Justice, that the criminal system of the Union creates an undue proportion of 'statutory' native offenders.

In civil suits natives who come into the courts of the Native Commissioners, to whom reference is made in a previous paragraph, have the benefit of their own law, and appeals are carried not to the Supreme Court, but to the two special Native Appeal Courts.³ Each is composed of a president and of two Native Commissioners or other qualified persons. The policy of racial separation has kept native law in a field of its own, and civil cases arising under native law are tried by tribunals which, while following European procedure with a certain amount of flexibility, are also guided by native custom and law and from which appeal lies to a court admitting similar principles. When conflicting decisions are given by a native appeal court, the Minister of Native

¹ General Law Amendment Act 46 of 1935, sect. 36.

² *Official Year Book of the Union of South Africa*, 1937, p. 424.

³ Act 38 of 1927.

Affairs may in certain circumstances cause a case to be stated for decision by the Appellate Division of the Supreme Court.¹ The separation between native law and European courts is not therefore complete. It is clear that the tardy recognition given to native law has already resulted in a considerable measure of europeanization, particularly in regard to such matters as testamentary disposition. The measures taken to codify native law in Natal² no doubt did something to preserve it at a time when native customary institutions were the object of attack by certain missionaries and were held in small regard by many administrators; but it also made its own modifications in the interests of assumed social improvement, such for instance as the regulation of *lobolo*.³ The process of adjustment, therefore, was not one in which law follows changing social relations; social relations were being directly influenced through the law.

The Union has in another respect a legal problem of unusual difficulty. It has to provide for natives who still retain (as in Zululand) a great part of their own customary observances; but it has also to provide for a population which is rapidly passing under europeanized conditions, but is not so fully europeanized as to come easily under European civil law. Difficulty arises, for instance, from the fact that natives who marry by Christian rites come under the European marriage law, and thereby abandon to an uncertain extent their rights and duties under native law. Both in its numbers, and the extent to which it has departed from native traditions, this part of the population is much more prominent in the Union than elsewhere.⁴ No conscious effort seems yet to have been made to adjust the judicial system to the needs of this class.

As will be seen, other territories have resorted to the increasing use of purely native courts, partly in order to supplement a restricted judicial machinery, and partly in order to meet the recognized need for the administration of native customary law. The Union has not hitherto attached the same institutional value to native courts as they have acquired in the philosophy of indirect

¹ Act 38 of 1927, sect. 14.

² See Chap. IX, pp. 358-9.

³ *Lobolo*, bride-price: see Chap. II, p. 41, note (3).

⁴ See Chap. IX, p. 509.

rule. At an early date the administration maintained certain judicial powers for the British Bechuanaland chiefs¹ and for those of Natal, but no general recognition of the principle was made till the Native Administration Act of 1927 provided for the grant both of civil and criminal jurisdiction to chiefs and headmen. The civil jurisdiction in cases arising out of native law and custom was to be without limit subject to appeal to the Native Commissioner; the criminal jurisdiction, confined to offences punishable under native law and custom, was limited to authority to impose a fine up to five pounds or two head of cattle. At the moment, however, the process retains something of its former extra-legal character. Fines are disposed of by tribal custom, and little has been done to give to the proceedings, by a system of record or the like, the regular judicial character which they are beginning to take elsewhere. The Native Economic Commission of 1930-2 noted the improved position given to these courts under the Act of 1927 and held that they afforded a better system than that of the administration of native law 'by European officials who in many cases know it only from books, and are ignorant of its subtle implications', and added that 'competent witnesses agree that substantial justice, according to native conceptions, can generally be obtained in a Native Court. European procedure is wholly strange to natives and is certainly not adapted to bring out the true facts when applied to a primitive people.'² They recommended a wider extension of criminal jurisdiction to native courts. The use made of the power has been unequal: in the Transvaal, 89 chiefs have criminal and civil powers and 9 have civil powers only; in the Ciskei none of the 7 recognized chiefs has judicial powers; in the Transkei 6 of the 29 recognized chiefs have civil, but none has criminal, powers; the 6 British Bechuanaland chiefs have civil and criminal powers; so also have 80 chiefs in Zululand, but the other 122 chiefs in Natal have civil powers only; in the Free State 3 chiefs have civil powers and 2 of these have criminal powers as well. It is unfortunate that no figures are published showing the extent of the work disposed of by these courts.

Amid the great variety of conditions characterizing the judicial

¹ H. Rogers, *op. cit.*, p. 225.

² *Report of Native Economic Commission, 1930-2, U.G. 22, 1932, para. 225.*

system of the British colonies and protectorates, there is one feature common to all. Each major territory has its own High or Supreme Court, which serves as a Court of Appeal, and has original jurisdiction in certain important civil and criminal cases, with power to issue prerogative writs of habeas corpus, &c. Some co-ordination has been effected by the creation of East and West African Courts of Appeal from the decisions of the local High or Supreme Courts; the majority of the Eastern and Western colonies share in this system, though Northern Rhodesia is still an exception. There is a proposal to create a Court of Appeal for the two Rhodesias, possibly including Nyasaland; civil appeals from Southern Rhodesia would, however, continue to be dealt with as at present as they involve Roman-Dutch law. An appeal lies from these courts, as from the Union Court, to the Privy Council; in the latter case however, leave to appeal must be expressly granted by the Union government and is only so granted in exceptional cases.¹ The appointments to the High and Supreme Courts are predominantly of a 'professional' nature; the judges are liable to transfer to and from all British colonial territories. There is a further point of importance. In some territories with extensive areas, the insufficiency of the cadre of judges has necessitated the grant to certain senior administrative officers of the position of additional judge, or the conferring of extended jurisdiction on selected magistrates.

The officers exercising subordinate (i.e. magisterial) jurisdiction belong at present predominantly to the administrative cadres; the policy of substituting a 'professional' class will be subsequently discussed. Normally a magistrate makes the preliminary inquiry in charges scheduled as serious, such as homicide, rape, and arson, and either dismisses the case or commits for trial before a circuit judge. Cases not falling into the scheduled class are normally disposed of in summary jurisdiction. Here the variations of competence are considerable, and do not seem capable of any logical explanation. A common competence is up to six months' imprisonment; but in some cases this extends to two years, in others up to the full limits imposed by law on any class of offence; in Northern Rhodesia even homicide cases are triable by magistrates. This variety of

¹ E. C. S. Wade and C. G. Phillips, *op. cit.*, pp. 376-7.

competence is to some extent adjusted by the general existence of a rule that a record of all magisterial cases is submitted to the High Court; those over a certain amount (for which six months may be taken as typical, though in some territories the limit extends to two years for certain classes of courts) require confirmation by the High Court, and all others are liable to revision. There exists as a rule a liberal right of appeal, but the difficulties experienced by natives in making appeals, owing to distance and the like, give to the process of confirmation and revision a greater practical importance than that of appeal.

This general outline of what may be described as the 'colonial' court system would hold good for the greater part of British colonial Africa. In the form which the system now takes it is designed to dispose of cases involving non-natives, to exercise jurisdiction over natives in areas where native courts do not exist, and where native courts exist, to deal with cases involving natives which are held to be unsuitable for these courts. Within the native court jurisdictions, the 'colonial' courts besides dealing with cases of serious crime, take cases such as witchcraft, mixed cases, such as masters and servants, cases to which the administration attaches importance (such as stock theft in Kenya), and breaches of certain administrative laws. In Northern Nigeria the 'colonial' court system has a diminished function owing to the high degree of jurisdiction given to the emirate tribunals, and similarly in Buganda where the Lukiko court¹ exercises wide jurisdiction, subject to revision by the administration. Even in its fullest and most complete form, however, the 'colonial' court system was always bound to leave to other agencies the bulk of native civil disputes, the lesser criminal offences between one native and another, and breaches of customary law. In practice all those classes of cases were settled by processes which were not recognized in the law of the territory. The chapter dealing with native administration gives some account of the historical development of the native court system. The recognition of native courts as part of the judicial system has been an essential feature of the political policy of fostering native institutions as a necessary factor in native development. That these courts should be of great diversity, alike in the

¹ See Chap. IX, p. 444.

composition of tribunals and the competence assigned to them, is inevitable; the local circumstances, which have produced an almost endless variety of native authorities for executive purposes, have produced a corresponding variety of native tribunals. The warrant recognizing or creating a court appoints in some cases the chief to function as a court, in others several chiefs, or a chief and his councillors, the latter being sometimes named by the administration, at others left to the operation of local custom. In other areas again, where no definite organization of chiefs and subordinate chiefs exists, the warrant recognizes what is in effect a village moot. In some cases the chief did not actually hear cases; they were discussed before him or in his absence as the case might be, for he was often, and frequently is still, a sacred and religious personage not easily approachable and far from the modern conception of a local native authority or president of a court. Where Africans are living in non-native areas outside tribal conditions, the administration has created tribunals, as it has created native executive authorities, by the appointment of local notables. The appointment of courts as such has introduced a principle not hitherto admitted in African society, which did not recognize a clear separation between judicial and executive functions; nor is this separation always clear under the present systems, which generally use the same person in the two capacities; the chief who makes rules by authority given in the native authorities ordinances often sits in judgement on offenders against them. Encouragement to distinguish these functions has been given in executive orders issued to chiefs in Northern Rhodesia to appoint separate judicial and executive councillors, the latter to include a younger element, while in Kenya traditional chiefs have no recognized place in the judicial system and are sometimes excluded from it.¹

In many cases the native court system has been graded to allow of a variety of competence as between larger and smaller units; and a more recent evolution has made provision for cases being taken on appeal from subordinate courts representing smaller units to superior courts representing larger units. From the superior native courts appeals may go, as in Tanganyika, to the British

¹ See Chap. IX, p. 389.

officer in his administrative capacity, thence to his superior officer and to the Governor; or, as in Kenya and Nyasaland, to the administrative officers and thence to the High Court; or again, to magistrates' courts and to the High Court as in Northern Rhodesia and, in certain classes of cases, in Nigeria and the Gold Coast. Sometimes, however, there is no power of appeal. Such is the position, except in the more important cases both civil and criminal, in the Buganda courts, and also where final native appeal courts have been instituted, as in Nigeria; here the only remedy is application on revision. The competence of native courts varies considerably; in Tanganyika, for example, subordinate courts have powers of one month's imprisonment or a fine of £2 10s., and higher courts of six months' imprisonment and a fine of £10; in Nigeria, powers in the four grades of courts vary from that of three months' imprisonment to full powers in the courts of the emirates, including the death sentence which is, however, subject to confirmation by the Governor. Fuller details regarding the constitution of native courts in the different territories are given in Chapter IX.

At the time when the native courts generally (with the exception of such courts as those of Buganda or the emirates in Northern Nigeria, which were on a special basis) were primarily envisaged as dealing with matters relating to native law and custom, it was always understood that they would treat as offences against native law crimes such as thefts, assaults, and the like; it may be said that the administrations encouraged this development, while reserving to the 'colonial' courts the trial of graver criminal charges and of breaches of administrative laws, or regulations made under them, such as those relating to taxation, Masters and Servants Acts, and the like. In some British territories there has been a growing tendency to bring within the jurisdiction of the native courts a number of offences constituting breaches of these administrative laws. This has been effected either by definite extension of their jurisdiction, or through the process by which native executive authorities are encouraged to adopt, as 'Native Authority Rules', administrative ordinances or regulations, with the result that breaches of such rules become cognizable by the native courts. It will be found in consequence that in many areas the work

of the native courts is not merely supplementary to that of the 'colonial' tribunals but is tending to replace it on an extending scale.

Important safeguards applied to the native court system are the provisions for supervision and appeal. Supervision is everywhere exercised by administrative officers, but different methods are adopted to secure that all records come under their notice. In some cases copies of records are sent periodically, in others courts are visited on tour, but in theory at least all records are seen. Supervising officers have authority to revise, to order re-trial, or to transfer to their own court, and they act either on their own initiative on inspection of records, or on complaint made to them. When they act on complaint the procedure is in a sense an informal appeal, differing from a regular appeal in that it is at the officer's discretion to examine the case. Circumstances make the informal complaint more popular than the formal appeal; in petty cases it is usual for a dissatisfied party to wait for the district officer's visit to his area; thus his complaint can be heard without the trouble or expense of a journey, and his chief is less likely to be displeased. Other safeguards, and these are as important to the African litigant as the two already mentioned, are provided by the procedure and environment of the native court itself, which usually ensure a degree of publicity and open discussion which is impossible in the formal proceedings of the European courts.¹

There is in the British territories an interesting adjunct to the 'colonial' system which at the same time has some of the advantages of the native court. The subordinate magistrates' courts instituted in certain areas (notably in Tanganyika and Kenya)² deal with the needs of African populations in locations, towns, and mining areas and certain coast areas in which the mixture of population makes it impossible to create courts on the tribal, clan, or a similar basis. They are subordinate to the High Court, and are presided over by Khadis, Liwalis, and similar non-European paid officers of government. Where native custom is concerned, they adopt the law of the parties so far as it can be ascertained by local inquiry; and for the rest, appear to apply a kind of rule of equity.

¹ See below, p. 297.

² See Chap. IX, pp. 515, 518.

In the French colonies, the system of *justice française* is, as already shown, administered by professional courts based as nearly as circumstances permit on the French model; the decisions of the local Courts of Appeal at Dakar and Brazzaville are in certain circumstances appealable to the metropolitan *cour de cassation*. But the *justice française* deals only with a very small part of the judicial work in the country; the bulk is regulated by what is in effect a separate system, that of the *justice indigène*. While there are some differences between the system in French Equatorial Africa, as described in the Decree of April 29, 1927,¹ and French West Africa, as laid down in the Decree of December 3, 1931, the latter may be taken as representing the system in its developed form. It is noteworthy that the French government began by recognizing the judicial authority which treaties had seemed to secure to certain of the chiefs, but on conditions which seemed to anticipate the unsuccessful exercise of it, which did in fact occur. Their powers were then swept away by a series of decrees ranging from 1912 to 1924, and the only position which the system now gives to the chiefs, as such, is the formal power of 'conciliation' in civil disputes. An agreement in conciliation when brought before an administrator and duly registered acquires judicial value.

The *tribunaux indigènes* are now, for criminal purposes, the *tribunal de premier degré* in the subdivision, and the *tribunal criminel* in the *cercle*, the first presided over by an administrator with two African assessors whose vote counts on a joint decision, the second presided over by the *commandant du cercle* with two African and two European assessors. The first court has a restricted competence, but the second has full jurisdiction, with competence up to sentences of death. The civil courts are, first, the *tribunal de premier degré*, which, sitting on its civil side, can be (and often is) presided over by an African notable, and, second, the *tribunal de deuxième degré* in the *cercle*, presided over by the *commandant du cercle* and two African assessors having a vote which counts on a joint decision. This court has high original jurisdiction in civil matters and appellate powers over the civil work of the *tribunal de premier degré*. At the head-quarters of each colony in French West Africa there is now a *tribunal colonial d'appel* composed of a 'professional' presi-

¹ A. Girault, *op. cit.*, vol. ii, p. 499.

dent, two administrative officers, and two African notables. It takes in appeal the civil cases which the *tribunal de deuxième degré* has heard on its original side; on the criminal side it hears appeals from the *tribunal de premier degré*. There is, finally, at Dakar the *chambre d'annulation* composed of a professional president and two councillors, two administrative officers, and two African assessors. It sits in revision on civil matters, in which cases are referred to it by the *Procureur Général*, and is the final court of criminal appeal from the *tribunaux coloniaux d'appel*.

The *tribunaux indigènes* thus differ widely from the native courts of British territory. They are the sole agency for administration of justice to Africans. But they are institutions framed on a European rather than an African model. They draw no support from traditional sources, save in so far as the African assessors command local respect, nor do they follow the methods of procedure, such as the public discussion of evidence and findings, which preserve the native character of the British native courts. They are native mainly to the extent that they are not regulated by the statutory law. It would seem further that the system must leave a great many cases to be settled extra-judicially; as compared with the large number of native courts in the British colonies, the French have only one court in each subdivision. In all French West Africa in 1934 only 8,835 civil and 9,266 criminal cases were decided, to which must be added 7,935 *ordonnances d'arbitrage*; these figures may be compared with those for Nigeria; in the same year 244,077 civil and 117,363 criminal cases were heard in the native courts, to which must be added 8,640 criminal cases heard in the protectorate court. The African population of French West Africa is about 14,500,000 and that of Nigeria about 19,000,000. Though the French law forbids chiefs to deal with criminal cases, yet a great number of disputes involving criminal offences must presumably be settled by conciliation or some other unrecognized process.

The Belgian system in its present form represents some departure from the original principle of the *Charte Coloniale*, which appeared to contemplate a wide extension of the system of professional tribunals. The incompatibility of any such system with African needs, quite as much as the lack of personnel, showed at

an early date that this scheme was impracticable. An informal system of 'palavers' failed to fill the gap, and the pressure of facts produced the reorganization of July 9, 1923,¹ which gave judicial powers to administrative officers, and the decree of April 15, 1926, which gave the native tribunals a place in the judicial system. There still remains, however, enough of the original tradition of the *Charte Coloniale* to give professional justice a strong place in the Congo system: and the professional magistrates are proportionately more numerous in the Congo than elsewhere; in 1936 there were 70 *magistrats de carrière*, including the *cour d'appel*, the *procureurs généraux*, the judges, and the *magistrats à titre provisoire* who may preside over 'professional' courts; these numbers compare with 229 *administrateurs territoriaux* who have judicial functions as judges in the *tribunaux de police*. A decree of 1934 makes it necessary that non-native cases should come before a 'professional' court. This was a swing back in favour of professional justice. It is worthy of note, however, that the period of two years' probation which officials must complete before permanent appointment as magistrates may be served in the administrative cadre; this does not, of course, dispense with the requirement of professional training.

Before describing the hierarchy of courts in the Congo it is necessary to explain the *Parquet* and its functions. This is a body which in some measure corresponds to the Attorney-General's department in a British colony, though its functions are much wider. Its personnel are mainly professional lawyers, but the Governor-General also appoints administrative officers to assist the *Parquet* in the discharge of its functions. Officers of the *Parquet* act as prosecutors in the criminal courts. They are also charged with the duty of conducting inquiries concerning the behaviour of magistrates and alleged abuses. But the function of this department does not end with legal administration; it also exercises judicial functions. The revision of judgements given in the police courts is entrusted to it. Furthermore, its officers sit as courts (*tribunaux du parquet*) and are the regular court of first instance in civil suits involving non-natives. On the criminal side, officers of the *Parquet* may exercise jurisdiction over cases which demand

¹ J. M. Jadot, 'La justice répressive au Congo belge', *L'Afrique française*, 1936, pp. 387 ff.

prompt action in areas more than twenty-five kilometres from the nearest regular criminal court.

The system of regular criminal tribunals now begins with the *tribunal de police* in each of the 104 'territories' into which the Congo is divided for administrative purposes; the *tribunal* is presided over by an administrator and its jurisdiction extends to all offences in which the maximum legal penalty does not exceed two months' imprisonment or where the maximum is five years, but the court considers two months adequate. For petty offences, the police court may sit without an officer of the *Parquet*. The decisions of the court are subject to revision by the *Parquet*. The *Parquet* receives the record and can revise on its own motion or at the request of the parties. The next higher criminal court is the district court, where the district commissioner has jurisdiction over all offences committed by natives. It is also a court of appeal against judgements of the police court (subject to some restrictions).

Over this system of police and district courts there is the Tribunal of First Instance for each province, a purely professional court, with appellate criminal jurisdiction in regard to first instance decisions of the district courts and revisionary decisions by the *Parquet*, and original criminal jurisdiction for crimes committed by non-natives. There are again, above this, two courts of appeal for the whole Congo, one at Léopoldville and one at Elizabethville, both professional in constitution. There is an ultimate appeal to the *Cour de Cassation* in Brussels.

In addition, however, to this system of regular courts, the Congo now recognizes the native court. Its development has a double source. It was designed to fill the gap caused by the insufficiency of the original system of European courts, but the principle has in recent years received support from those who share the feeling that African institutions have their own intrinsic value. The courts now recognized are first the *tribunaux de chefferie*, which are in effect the customary courts of chiefs; the *tribunaux de secteur*, which are 'created' in the sense that they combine units insufficient to have customary courts of their own; the *tribunaux de centre*, which are also 'created' courts providing for the needs of the mixed native populations in locations,¹ &c.; and finally the *tribunaux de territoire*.

¹ See Chap. IX, p. 525.

The last are presided over by an administrator, and composed of judges nominated from the *chefferie* or other courts, and are mainly intended to act as revisionary courts. The jurisdiction of all these courts is equal in scope and follows the native practice in making no distinction between civil and criminal cases; but the criminal jurisdiction of native courts is confined to cases in which custom provides a penalty. Their competence is limited to imprisonment not exceeding two months and whipping where custom admits of it; all offences provided for under the written law involving punishment exceeding these powers must come before the courts with European personnel. The general tendency at present is to emphasize the civil rather than the criminal aspect of the work of native tribunals.

Revision on facts lies with the Territorial Court, over which an Administrator presides; but supervision of the work of the native courts lies with the *Parquet*, which has certain administrative powers over the courts and sees their records. It can annul their decision on grounds of law, or order retrial. It is charged with their inspection; but the possibilities of inspection are limited. In 1935 the four types of native courts gave 24,056 judgements, of which only 17 were upset by the *Parquet*; the *tribunaux de police* gave 17,112 judgements.

In Ruanda-Urundi two grades of native courts are recognized, the *tribunaux de chefferie* and *tribunaux régionaux*. Supervision of their work lies not with the judiciary but with the local administrative official, who may attend any native court and advise the judge, may review any sentence on appeal or on his own initiative, and is required to quash any sentence which is contrary to public morals.

IV. PROBLEMS ARISING IN REGARD TO THE ADMINISTRATION OF JUSTICE

The difficulty of reconciling European and African ideas on law and justice has prompted some thinkers to suggest that the question should be approached from a view radically different from that which has hitherto held the field. The difficulty of reconciliation has a double origin: the difference in the conception of law, and the difficulty of adjusting its machinery.

As to the former, that there is a great dissimilarity of approach

is obvious enough, though this may be due as much to present cultural conditions as to any radical difference of mentality. It may be said that, in regard to the criminal law, while the African can readily accept punishment by the state for the more usual offences against persons or property which are reprehensible in both European and his own eyes, he is a stranger to the idea that it is necessary for society to regulate behaviour through the wide use of police regulations and penal laws, such as tax, pass, or labour laws; on the civil side, the African's inexperience of all the contractual relations, involved in commercial transactions based on money economy, have made him a stranger to the legal methods in which a modern individualistic and industrialized society has expressed its needs. How far is it possible to adjust European conceptions of law and justice to these conditions of mind? The answer does not lie in any change in the law; it depends on the extent to which administrations are determined to impress their own conceptions of behaviour on Africa.

We must be clear, in the first place, whether there does in fact exist a field in which the lawgiver could make wider concessions to African concepts. It is not, for instance, possible to find any compromise on certain questions, such as trial by ordeal or the elimination of persons who commit, even involuntarily, an offence against religion; nor is it possible to suggest that administrations should deprive themselves of the power to implement their administrative ordinances (such as those regulating health conditions, preservation of forests, and the like) by attaching penal clauses to them. Even on the subject of witchcraft, the outstanding problem of the lawgiver in Africa, the main principles seem clear, though further consideration might produce some change in the form the law should take. There is evidence that the operations of both protective and harmful witchcraft are continually in the native mind, and although the spiritual force of African religion may be diminished by contact with European influences, belief in witchcraft and magic persists¹ in the urban and industrial areas as well as in rural districts, and an element of fear of occult forces is to be found in much of the litigation by Africans. It is usual for legislation to prevent native courts from judging

¹ D. Westermann, *Africa and Christianity*, 1937, p. 133.

cases in which this element is apparent, and the practice of magic is expressly forbidden by a variety of laws which have not escaped criticism on the ground of their lack of discrimination and their wide divergence in definition and provision of punishments. The Nigerian law is, for example, mainly directed against ordeals, and persons who represent themselves as sorcerers, or who possess charms, are punishable by six months' imprisonment, while in Northern Rhodesia witch-doctors are liable to seven years' imprisonment; in Kenya a milder law does not mention witch-doctors, but reserves its severities for cases where the claim to supernatural powers has some evil purpose; but in Uganda a witch-doctor is punishable with five years' imprisonment. The intentions of these laws, reflecting an attitude which regards magic and witchcraft as a form of fraud, are not readily understood by people of whom large numbers regard the operations of magic as normal events of everyday life.¹ Some of the laws reflect the sentiments of a period when native institutions had received a less discriminating study than has been given to them of late years, and it has frequently been necessary for the executive to exercise its discretion in order to reduce judicial sentences involved by the strict application of the law. It would seem reasonable that the existing legislation on the subject should now be reviewed, with the purpose of bringing under the penal law only that use of wizardry or magic which has, or is intended to have, harmful consequences.

These considerations apply also in part to the field of civil law; it would not be to the interest of Africa to refrain from making that gradual advance towards individualization of property in land which may lead to improvement in production.² Africa is no longer divided between Europeans and primitives; the law must be such as is suitable also to the rapidly increasing population which has ceased to be primitive but is not fully europeanized. There is no clear-cut solution of the difficulties arising out of the divergence of European and African conceptions of law; all that is possible is to secure the utmost acceptance for the law by the fullest discussion before it is made, and by a careful study in advance of its probable reactions on African society.

¹ See *Africa*, vol. iii, no. 4, 1935.

² See Chap. XII, pp. 850 ff.

On the other hand, the machinery of the courts seems to offer a field in which readjustment may well be considered, and is indeed the more necessary because, as has already been observed, the procedure of judicial administration is a more important factor in earning respect for the law than the substance of the law itself. The formal court presided over by a specially trained magistracy is an alien idea to most Africans. The legal or customary affairs of the individual or the group are usually discussed and settled in the same places as other affairs and by the same persons. Except in the courts of the larger states in Nigeria and in some urban areas, native courts are still held in simple buildings to which a large number of the public have access, or in shelters open at the sides, or even in the open air. The accused sits with the complainant before the audience and a judge or judges who know his own language, his family, and the circumstances of his life. The complainant tells a story unrestrained by European rules of evidence, and the accused interjects questions, comments, and objections; his own evidence is similarly given. The type of direct perjury, so frequently experienced by European courts trying native cases, is less likely in a court where the parties are surrounded by an interested audience of friends and relatives, and where the court is in a position to check, by the application of rudimentary rules of evidence understood and accepted by the parties, irrelevance or deviations from the truth as the story is unfolded to it. Judgement is frequently delivered after what is tantamount to a general discussion in court, and possibly after a more restricted discussion between members of the court, the court clerk, or elders who are trusted friends of the presiding chief. As the court is not a court of record, proceedings are not hampered by the necessity of a written report of the evidence. The usual practice is for the court clerk or scribe, a man often of little book-learning but of considerable importance and influence where judges are illiterate, to enter the names of the parties and short descriptions of the nature of the case and the judgement given. The knowledge that this record will at some future date be read by the supervising administrative officer has in many cases a restraining influence on the court.

This procedure may be contrasted with that of the European

court, where evidence is given according to rule and is conveyed to the magistrate through an interpreter; linguistic difficulties, often very great, the restrictions on free discussion, the lack of contact with the presiding magistrate, and even the need for standing in the box may well give the accused a feeling of helplessness and oppression not always relieved by the fairness of the judgement. The rules of admissible evidence must often seem to the African to have been designed to hamper the discovery of the facts. Again, statements made in evidence acquire a special status through being made under oath, but the court cannot avail itself of those forms of oath which have special force in Africa. Native courts, following customary procedure, often place great reliance on certain oaths or observances of a similar nature; for instance, a native court may permit a litigant to challenge his opponent to testify to the truth of his statements by eating food over the grave of a common ancestor of the two parties, and the answer to the challenge would be treated as decisive of the issues involved.

The difficulties of the situation are obvious, and the administrations have in more than one instance found it necessary to attempt some means of establishing a closer contact between the law and the people. In serious cases such as homicide and in High Court cases, where the accused may be confused by elaborate procedure and ceremonial and by the process of police inquiry and preliminary examination before a magistrate, administrations frequently provide not only counsel for the defence, but also a European, usually a District Officer, with a knowledge of the language and customs of the accused, to act as an advisor to the counsel and a friend to the accused. In the courts presided over by the administrative officer in his judicial capacity, procedure is sometimes modified to suit native custom; but here again the difficulty arises that these are also courts of record in which evidence must be taken according to prescribed rules; again, especially in civil cases, as knowledge of native custom has often to be acquired by evidence taken as the case proceeds, questioning regarding points that are common knowledge to a native court also creates a restricting atmosphere; the African is said to speak freely about some of the matters arising out of native custom, but is reserved and confused when asked for explanations of certain

usages or courses of action, either because the inner meaning is not clear to him, or is connected with religious or intimate matters which he hesitates to discuss.

The fear of a tendency towards technicality has been largely responsible for the exclusion of professional pleaders¹ from certain classes of actions in the courts of administrative officers and sometimes also from magistrates' courts presided over by junior members of the High Court cadres. There are other reasons which support this policy. The expense of litigation in which professional pleaders were employed would normally be heavier than Africans ought to be allowed to incur. Professional advocates would, in Africa, usually be so superior to their clients in their legal knowledge and forensic powers, that they would be likely to establish an ascendancy over clients which would open the way to abuses. As the accused person has no legal adviser, the duty of explaining to him what are his rights under the procedure of the court rests upon the presiding magistrate. In some instances an administrative officer may suggest to the accused what witnesses he should call, and even how he should conduct his case, but normally the responsibility of acting as prisoner's friend rests with the presiding magistrate, who assists the defence in questioning witnesses.

Though, however, some steps have been taken to meet the difficulties above referred to, the main problem still remains. There are many who feel, not without reason, that the growth of a technical procedure, inevitable where a machinery based on European practice has once been introduced, offends against the prescription of the earlier Orders in Council referred to on page 274, and they remark the obvious difficulty which courts experience in setting aside their rule of procedure in order to secure substantial justice.

It is possible that the existing procedure does in substance secure some greater measure of justice than the criticisms made would suggest; it is possible also that here, as also in other countries where European legal procedure has been applied, the native, faced by a system which he does not comprehend and which presents to his mind great disadvantages, nevertheless gives it a certain

¹ e.g. Nigeria, *Laws*, cap. 4: see also Protectorate Courts Ordinance, no. 45 of 1933.

measure of acceptance because he appreciates that its intention is to secure an impersonal and impartial method of trial. But at the same time there are few problems which demand more careful study than that of an effective adjustment of existing judicial methods to meet the needs of the African native. It is regrettable that the subject has not been brought under any comprehensive inquiry by the governments concerned. In the Union, commissions such as the Cape Native Laws and Customs Commission of 1883 dealt at some length with the general legal position in regard to natives, but no specific inquiry has been made on the administration of justice, and the Native Economic Commission of 1930-2 made only the reference to native courts which has already been quoted.¹ The working of the criminal judicial system in East Africa was examined in 1932-3 by the Commission presided over by Sir G. Bushe,² and there is much valuable material in its proceedings and in the opinions recorded. Its scope, however, included only criminal justice and excluded the native courts. Moreover, it judged of the adequacy of the present arrangements largely in relation to their approach to the ideal which it seems to envisage, namely, the trial of all serious crime by an extended cadre of High Court judges, leaving preliminary investigations and the disposal of minor charges to magistrates who would, as far as possible, be professional in origin.

This attitude, and in particular the preference expressed for professional magistrates, aroused a controversy which attracted undue attention to what was in truth only one part of a much larger problem. The question of the separation of judicial and administrative functions in the magistracy was not a new one in Africa. It had been discussed in the Union by critics of the native policy, though here the case was somewhat exceptional, in that magistrates were under the control of ministers who might be assumed to be more directly subjected to political pressure than the heads of colonial administrations; the only colonial analogy was Kenya, where one class of crime (stock theft) was described at one time as having assumed the proportion of a major political

¹ See above, p. 284.

² *Report of the Commission of Inquiry into the Administration of Justice in Kenya, Uganda, and the Tanganyika Territory*, Cmd. 4623, 1934.

issue.¹ Something has already been said of the Belgian attempt to rely predominantly on professional justice, and its issue.² The decision of the British government on the report of the Commission disclaimed the elimination of the magisterial functions of administrative officers even as an ultimate objective, and expressed its appreciation of the value of the local knowledge and experience of administrative officers in deciding such questions as motive, extenuation, or credibility of evidence. Nevertheless the Colonial Office appears to have followed in East Africa the policy of increasing gradually the number of officers discharging purely magisterial functions, though the personnel is not always of 'professional' origin.³ In Nigeria a more decisive step was taken in 1933 which was definitely stated to be in pursuance of the policy that, as far as practicable, judicial functions should not be discharged by administrative officers.⁴ The situation in Nigeria had admittedly been different from that of East Africa, for in the former the provincial court system had placed extensive criminal powers in the Residents' courts, subject to confirmation of sentences of over six months by the Governor, or, in the case of death sentences, by the Chief Justice. In Ashanti and the Northern Territories of the Gold Coast the Chief Commissioners' courts had had somewhat similar powers. The change introduced in 1933⁵ brought Nigerian practice more nearly into line with that obtaining elsewhere, by substituting circuit judges for the Residents' courts, but went further, in so far as it extended the number and scope of work of non-administrative magistrates. It was a further departure when these magistrates were made the appellate authority for certain classes of native courts. There has thus been an effective extension of 'professional' justice; though the effects of the measure are obscured by the fact that judicial posts have so far been in many cases filled by officers of previous administrative experience.

There is as yet no common agreement on the question of prin-

¹ Ibid., p. 17.

² See above, pp. 291-2.

³ In Kenya there are nine posts for these Resident Magistrates, in Tanganyika seven, and in Northern Rhodesia four.

⁴ *Objects and Reasons*, Ordinance 45 of 1933, Nigeria.

⁵ Nigeria Native Courts Ordinance, no. 44 of 1933.

ciple, and there is not yet sufficient experience to judge of the results achieved. Any consideration of the question must, however, take account of the low economic standards of Africa, which make it necessary to keep the expense of the judicial cadre within those limits which the people can afford. Even if the whole of the personnel of the courts were of the 'professional' type, a wide sphere of judicial work would remain with the administrative staff in their relation to the native courts.

On the remaining recommendations made by the Commission for improving the work of the courts there is a larger measure of agreement; but as already suggested, the whole subject of the working of the courts seems to be one which requires more extended study on a much wider basis, which would take into full consideration the feasibility of adjusting the machinery so as to secure greater respect for the law from the African. A study on this scale would inevitably have to embrace the question of the employment of Africans in the judiciary: but it is of even greater importance that it should embrace a study of the native court system, for it is in the extension of that system that many find a promise of the solution of the problem.

There are already areas in which native tribunals dispose of case work which in quantity far exceeds that of the courts with European personnel.¹ Their efficiency rests on two factors; the first, the recognition they can obtain from Africans as an institution which has its basis in their own traditions; the second, the quality of the guidance they obtain from the supervisory authorities. As to the first point, the success of the native tribunal rests on the same foundation as that of the native administrative institutions; where success has been attained, it has generally been related to the use made of customary rather than of created authority.² Perhaps the most recent proof of this is the new position taken by the native courts in south-eastern Nigeria as the result of the substitution of traditional authorities for 'warrant chiefs'. It is probable that where (as in Kenya) the courts have been constituted on a method which neglects the tribal basis, the administration would

¹ In 1937 Native courts in Tanganyika dealt with 82,131 cases; courts with European personnel dealt with 15,889. *Report on Tanganyika Territory for 1937*, p. 17.

² See Chap. IX, pp. 527 ff.

have preferred to adopt this basis, were it possible now to recreate it. One almost universal result of adopting the tribal or clan basis is that the judicial authority is identical with the executive. African society is still at that stage of development when there is no clear distinction between the two; and any discussion of the desirability of separating them would be academic, since as a rule no separate personnel could be found for the judiciary which would have the necessary traditional authority. The Alkali courts of Northern Nigeria are quoted as an instance of separation; but the Emir's court still retains its judicial functions in certain classes of cases.

Although traditional conditions prevail to a great extent in native courts, they are being modified by the creation of the simple machinery for recording cases and arresting offenders, and by the demands made on the court by changing conditions. Familiarity with the procedure of European courts often brings a European atmosphere into the native courts, which is not always to the disadvantage of the plaintiff or defendant who, in areas where courts are a recent innovation, has already become accustomed to the more rapid methods of European courts. Again, the differentiation between criminal and civil offences is becoming more defined, partly owing to the advice and influence of the administrative officer, but more frequently owing to the nature of the rules made by native authorities and enforced in the courts. These introduce a type of petty criminal offence, such as a breach of some general regulation regarding road-making, erosion, or health, hitherto unknown to tribal courts; also courts are in many cases required to take cases arising out of breaches of the statutory law of the territory or the penal code. In old times the types of cases heard before the chief's or tribal court were limited to sexual and agricultural affairs, inheritances, witchcraft, and other matters which often concerned a narrow circle only, and were ruled by well-known conventions and hardly affected by circumstances outside the tribal control. To-day native society is more complicated and feels itself dependent on an alien rule and on economic and social conditions over which it has no control. The native authority and the native court have become increasingly concerned with the problems arising out of the impact of the new conditions on tribal society.

Will not the extension of native court jurisdiction to include

purely 'statutory' offences, which find no condemnation in native law and custom, tend to deprive the tribunals of the support they might otherwise receive from African opinion? Policy varies in this respect. It was natural enough that the Moslem courts of the emirates should be given a very wide jurisdiction; but there have been those who hesitated to place on the normal tribal or clan court the burden of dealing with statutory offences which are not accepted by the tribe as part of its own code of behaviour.¹ The Belgian policy has been marked by the same feeling: speaking of the native courts M. Sohier emphasizes that, although they are given a competence in criminal matters, this is a small part of their functions, which are primarily to allow that 'les affaires civiles, patrimoniales ou personnelles, des noirs, puissent être réglées d'une façon adaptée à la fois à la société indigène et à l'occupation européenne'.² On the other hand the policy in some British areas, such as Tanganyika Territory, has led to a very wide extension of jurisdiction of this type.

There is a further problem in adapting the native court system to the needs of mixed native populations in the towns, or native locations of mining centres.³ The legal problem is one of great difficulty. It is not to be solved by merely applying 'European' law to such areas, nor by placing them under customary local tribunals; it is indeed difficult to justify the action of some administrations who, faced with the problem of these mixed populations, have simply brought them (theoretically at least) under the jurisdiction of the nearest native court. Reference has already been made to courts of the type of the Native Subordinate Court of Tanganyika Territory and Kenya⁴ or the *centre extra-coutumier* courts of the Belgian Congo,⁵ whose function is to provide for Africans who are not yet europeanized, but are out of their tribal setting. The extent to which such courts are needed, and the procedure to be applied in them, provide problems which will grow with the expansion of industrial or urban conditions. The problem will be the more urgent because the urban population will tend to come

⁵ See above, p. 293.

before the tribunals more frequently than Africans living under less complicated conditions in the rural areas; also they have not all the extra-judicial agencies for arbitration and the like which tribal and clan relations afford. Possibly the solution will be found in the wide extension of the system of subordinate magistrates' courts officered by Africans; and it may even be that in their efforts to adapt tribal custom to the cases which come before them we may see in time the evolution of a type of Bantu natural law (an African *jus gentium*), which may make a new starting-point for the amalgamation of African and European law.

The second factor determining the efficiency of the native court system has been described as the quality of the guidance exercised by supervisory authorities. The crucial importance of supervision, and the difficulty of its exercise by a small administrative staff, have possibly weighed as strongly as any theory of direct rule in turning French policy against the institution of native courts on the British model. The French would perhaps admit that their system, which means that there is no court where there is not a European available to preside over it, makes but small provision for the judicial needs of a large and scattered population; but they would claim, on the other hand, that such cases as come to trial are decided by an agency in which they can have confidence. The Belgian system is admittedly in its experimental stage, but at the moment it falls between two policies. It has created a true native court, but emphasizes its essentially civil functions, while the system by which the professional magistrate rather than the administrator becomes the revisionary authority for the native courts restricts the possible scope of supervision.

The British system gives a wide jurisdiction to the native court, but from the first has put emphasis on supervision and has placed that function primarily in the hands of the administrative staff. Supervision has two elements. First, the inspection of records, and the consequent exercise of powers of revision, or of transfer to trial in the revising officer's own court, either on application from a dissatisfied party or on his own motion; secondly, the use of the formal power of appeal. The former is, in most areas, by far the more important process. There is the widest diversity in the measure of contact achieved in different territories between the

administrative officer and the native courts. There are many areas in which native courts are carefully supervised by administrative officers, who read the records of all cases and discuss with the personnel of the court every point which is not clear. In Bechuanaland, for example, the Native Tribunals Proclamation of 1934 provides that court records must be examined every three months. There are other areas in which, owing to the nature of the country or lack of staff, supervision is of a far lower quality. In the Gold Coast, where the inefficiency of many of the native courts was for long notorious, a strong lead has been given to supervising officers by a declaration of the Governor that it is not the duty of government to bolster up corrupt and inefficient tribunals,¹ and Ordinance no. 18 of 1935 has now made native tribunals directly subject to inspection and revision by administrative officers.

There is an equal divergence in the method of recording native court proceedings; in some areas the fear of the influence which may be exercised by court clerks has restricted the record to a bare entry of the decision; the usual practice in East Africa is for the record to consist of the names of the parties, and short statements of the claim, or offence, and the decision; in other areas all the evidence is meticulously recorded, read over, and attested. Revision is in some cases a complete retrial (and indeed this is necessary where there is no adequate record); in others it takes place on a review of the recorded proceedings.

There is also great diversity in practice regarding appeal. In the West African colonies and, as we have seen, to some extent in East Africa, though the greater number of appeals is still to the administrative staff, systems whereby appeals may be made to the High Court have brought the native court more directly into touch with the High Court system.² Recent years have seen a gradual development of the native courts of appeal, constituted either by giving appellate powers to higher grade courts (as for instance the Lukiko³ court in Uganda or some of the chiefs' courts in the Lake

¹ *Address by the Governor at the opening of the 1933-4 Session of the Legislative Council*, p. 13.

² In the Gold Coast there is provision for appeal from the native courts to the magistrates' courts, thence in civil matters to the Chief Commissioner's court, and in criminal cases to the Divisional court, and finally to the West African Court of Appeal. (Northern Territories, Ordinance no. 31 of 1935; Ashanti Ordinance no. 21 of 1935.)

³ See Chap. IX, p. 444.

Province of Tanganyika), or by bringing together in a territorial court the representatives of tribal or clan courts. This system has its value since it tends to keep litigation within the range of the native court system, and avoids too early a contact between two different types of court.

It is perhaps only a minor point that the system allows to a litigant a double course of action; he may either carry his appeal to a final native court or take his chance of an informal application to the administrator for revision. The coexistence of revision and appeal, however, has advantages. Where native courts are beginning to take new classes of cases, for instance breaches of new native authority rules regarding forest preservation, the eradication of weeds, or the burning of dead cotton plants, intervention by the revising officer may constantly be needed. The same officer, however, might well hesitate to interfere with the decision of the court in such a matter as the return of dowry when a wife has run away from her husband, and in such a case appeal to the superior native court is the more natural course for an aggrieved party.

It is inevitable that the evolution of judicial systems in different areas should involve a great measure of diversity in practice; and clearly elasticity is an advantage during a formative period. But the native court system as viewed in different territories presents a diversity of practice which in part at least must grow from a diversity of views, and some study of principle might at this stage be of advantage. There are other matters which, if they appear to be primarily of juristic interest, are none the less of more than academic importance. Is it possible to create, out of the different elements which now make up the body of law in any one territory, a homogeneous body of law which shall serve adequately the needs of the whole population? That population, as already pointed out, has three main components: the section completely detached from tribal life; the urban and industrial populations still attached to their native traditions and customs; and the great majority of Africans in the tribal or native areas. French and Belgian policy pointed originally towards a single system on a European model to which the African would be expected to adapt himself with the progress of civilization. This may still be in some sense the ideal, but practice in the French and Belgian colonies tends to depart

from it. The statutory law, it is true, remains predominant, and the judicial system is such that, while native law is recognized, it is continually being influenced and moulded by European concepts. In effect a kind of dualism is being established, and there does not seem any clear view as to the lengths to which this process should now go, or how it should be guided. The British, always less definite in objective, have characteristically given first place to what appeared to them to be the needs of African society, and provided the mechanism for this in an extended use of purely native tribunals. There are many obvious advantages in this, but the use of native tribunals does not in itself bring us nearer a solution of the problem of producing a homogeneous body of law. In fact there is not yet any clear view on the fundamental question whether a uniform law is to be achieved by a more liberal adaptation of English law to the needs of African conditions, or alternatively by a deliberate and regularized modification of the law and procedure which the native courts apply. At the moment, native law itself is undergoing its evolution in circumstances of which the effect is not perhaps always fully recognized. A kind of local law is establishing itself which varies district by district. The rules made by native authorities, often referring to matters of customary law, are given a judicial effect;¹ and administrators in the course of revision and appeal are day by day making their own case law which is of purely local scope.

More important still is the need that native law should adapt itself to the changing needs of society. There is evidence that such adaptation is in progress. Thus in some areas, where primitive laws of inheritance have proved inadequate to modern conditions, a law of testament is being recognized in the native courts, and it would be possible to give further examples of a natural growth of customary law under the pressure of changing circumstances.² It is, however, doubtful how far this adaptation has gone in the field of contractual relations, and clearly in many cases the conservatism of tribal heads has not allowed it to follow the actual course of changes in the forms of land tenure or family relationships. It has always been recognized that the union of executive and judicial authority had its own problems, in that it rendered it difficult to

¹ Cf. Chap. IX, pp. 389, 441.

² See Chap. XII, pp. 842-63.

find a place in the native court system for the younger educated man who will prevent the courts from standing too rigidly on established custom.¹ Under the present policy questions of adaptation of custom will remain outside the range of the statutory law, but they can in the long run hardly be left to the unregulated action of a great diversity of native tribunals. A comparative study of native law as it operates to-day is clearly required and its object need not necessarily be codification. It is generally agreed that the codification in Natal, with its promulgation in 1891, has tended in the absence of periodic revisions to deprive native law of that elasticity in adaptation which alone can enable it to meet the needs of a changing society.

Another result of the proposed study of the working of the native courts might be the evolution of a simple code of procedure. Some measure of formality follows automatically from the recording of cases, the appointment of clerks, the auditing of court accounts, the employment of police to make arrests, serve summonses, and execute judgements, and even from the building of court houses—which in certain instances are of European design. While anything like a rigid code of procedure would make a radical change in the native court system, it may not be possible to allow the existing diversity of procedure to continue without limit, and some simple rules of procedure will clearly be required.

V. PUNISHMENTS

Many have felt that the difficulty of securing respect from Africans for European systems of justice is increased by the apparent unsuitability of European ideas of penology to African conditions. The African method of dealing with offenders included no retributive action. The repair of damage done, with social and spiritual penalties to correspond, comprised the main punishments available, save when in exceptional cases an offender against the welfare of society (either intentional or unintentional) was ostracized or had to be eliminated. The use of imprisonment as a punishment was practically unknown. There are some who feel a doubt as to the deterrent value even of a long term of imprison-

¹ See *Report on Higher Education in East Africa*, Colonial 142, 1937, p. 110.

ment; but there can be few who do not see mischief in the large numbers of short-term sentences given for statutory and similar offences. They must fail of their effect so long as they carry no social stigma, though when imprisonment involves economic hardship this may itself be a deterrent. In Uganda poll-tax and *luwalo*¹ offenders, amounting at times to 60 per cent. of the total number of prisoners, use the native administration prisons as a temporary expedient for delaying payment of tax. On the other hand there is a tendency for native courts to imitate the European courts in awarding sentences of imprisonment, possibly as an easy way out of cases in which carefully assessed compensation would be more appropriate; thus imprisonment for matrimonial offences is not infrequent. Again, a fine no doubt appears illogical to a people who have hitherto regarded compensation to the injured party, and not payment towards state finances, as the natural corrective to ill behaviour. While, however, the objections felt by many Africans to European ideas of punishment may be admitted, there is a real difficulty in finding an alternative. Though the conclusion of the Commission of 1933² that 'the punishments sanctioned by all enlightened systems of jurisprudence are the most suitable' to Africa may not cover the whole field, it is at all events clear that no one has yet presented any practical substitutes for fine or imprisonment.

There may, on the other hand, be a good case for an effort to make a closer correspondence between European views and native custom. Thus there seems to be a field for further study of the value of the probation system, particularly in tribal areas, since this might base itself on collective responsibility; some experiments have already been made in this direction in Natal and Zululand.³ In the Union of South Africa detention camps are being formed for short-term prisoners; 19,600 petty offenders were admitted to these in 1935. In East and West Africa it is usual to employ tax defaulters and petty offenders in road-making camps, and as far as possible outside prisons; prisoners are, generally speaking, classified according to length of sentence; long-sentence men go to central

¹ A customary service, now frequently commuted: see Chap. X, p. 575.

² *Report*, op. cit., Cmd. 4623, pp. 58, 97.

³ *South African Outlook*, vol. lxxvi, no. 779, 1936, p. 74.

prisons; for example in Tanganyika the smaller out-station prisons retain offenders awarded less than six months' sentence, in Uganda under one year, in Nigeria under two years; prisoners are also graded as habitual or serious offenders, first offenders or adolescents; but differentiation often has no value in practice, as accommodation does not always permit of the grades of prisoners being kept apart, and those who have no criminal background are frequently required to live and work with habitual criminals. Prison buildings are often of a temporary nature, or consist of a single large cell into which all classes of offenders are shut at night: central prisons may have separate cells for a few special cases, but the usual practice is for prisoners to be shut at night into large rooms, sometimes containing as many as forty prisoners.¹ It has to be recognized, on the other side, that great psychological hardship may be involved in confining Africans in solitary cells. Treatment of the prisoners often depends on the locality in which they are convicted and not on the nature of their offences; it is found difficult to treat the same category of prisoners in an identical manner.² In some native administration jails,³ and in some local prisons under the paternal administration of a sympathetic District Officer, no doubt prison is little hardship or punishment, but it is difficult to believe that long confinement involving separation from the family and social life, which means so much to the tribal African, weighs lightly on the African prisoner. Where native administrations run their own prisons, as in Nigeria and in Uganda, conditions are very similar to those in the government local prisons, but supervision is possibly laxer. The useful employment of prison labour presents difficulties: in South Africa and Southern Rhodesia it is hired to private persons and to municipalities, as well as employed on public works; in East Africa prisoners are employed on public works such as the upkeep of aerodromes and anti-malarial work; it is usual to give industrial instruction such as carpentry, tailoring, and building, to long-term prisoners in central jails. In local prisons labour is employed on station upkeep and sanitary

³ Uganda, *Report of the Prisons Committee*, 1936, p. 5.

services; the Uganda Commission found it necessary to recommend that prisoners should not be employed for the benefit of officials or private individuals.

As regards corporal punishment, the whip of hippo-hide or similar material was an instrument with which Africans were at one time only too familiar. It was always in the hands of the slave-traders and was often employed by Europeans,¹ though even some of the earliest European travellers set themselves against its use.² Such an instrument produced an open sore at every stroke, and was capable of inflicting permanent injury. Native chiefs adopted it widely as a means of enforcing their authority, and in the early laws of most African colonies it was recognized as the instrument for the infliction of corporal punishment. The Belgian and French laws do not allow the courts presided over by Europeans to inflict whipping save as a punishment for jail offences, but the Belgian law allows native courts to inflict whipping where native custom has practised it. So far as the British territories are concerned, the use of the hide whip has been abolished.³ When the courts award a sentence of corporal punishment it is now inflicted with a light rattan cane, and a cotton cloth is spread over the buttocks. The use of the 'cat' is retained in some of the British dependencies, though not in all, for the punishment of brutal crimes of violence. The value of corporal punishment has been much canvassed.⁴ In the British colonies the general tendency has been to restrict caning to juvenile offenders, and to certain graver offences (such as violence or brutality) in the case of adults. The recent judicial reorganization in Nigeria requires the native courts to obtain confirmation from the administration (or in some cases from the Emir) before the sentence is carried out; it is noticeable that this has resulted in a great reduction in the number of punishments inflicted; in the Northern Provinces sentences of corporal punishment were 7,000 in 1933, 1,600 in 1934, and fell to 900 in 1935, but it is open

⁴ Op. cit., Cmd. 4623, pp. 61-3.

to doubt whether fine or imprisonment has proved a suitable substitute. No general conclusion on the value of retaining corporal punishment is possible in face of the great diversity of conditions prevailing in Africa. There are areas where its total abolition is clearly desirable; there are others where it is obviously a more appropriate form of punishment than fines or imprisonment.

The suitable punishment of juvenile offenders presents difficulties. Magistrates are reluctant to convict a child when it means that he must go to prison, and it is doubtful whether caning is in all cases a suitable punishment, or whether the young African takes a serious view of a light rattan cane. In Southern Rhodesia and Tanganyika small reformatories exist for juvenile offenders, but reformatories which must needs be few and far between only meet the cases of the few habitual offenders. In Nigeria the Kano native administration has a juvenile prison where basket-work and gardening are taught, and the government runs an industrial school at Enugu at which some thirty boys are now undergoing treatment. The Gold Coast government subsidizes a Salvation Army boys' home, but missionary organizations do not appear to be used for this purpose elsewhere. In the Union there were 14,481 male and 2,502 female native juvenile prisoners in 1935; government has been empowered to establish reformatories, but there is no evidence that native juvenile offenders are as a general rule dealt with in separate institutions.

It is usual for separate accommodation to be provided for women prisoners; but in native administration jails in Uganda they are apparently confined in the same jail as men under the supervision of male warders. It is hardly conceivable that prison under ordinary circumstances is an appropriate form of punishment for females in native areas, and it has been suggested that in the case of short sentences they should be put in the extra-mural custody of responsible persons.¹ The absence of mental institutions, or remoteness from the few existing institutions, necessitates the retention of lunatics in prisons in most East and West African territories.

In Kenya the labour section of the administration arranges for

¹ *Report of Prisons Committee, 1936, pp. 6, 9, 18.*

the repatriation of discharged prisoners.¹ By arrangement with the authorities, the Salvation Army assists ex-convicts, but there are no special prisoners' aid societies; the usual practice is for District Commissioners to be informed of the release of first offenders so that they can afford them any necessary assistance. It has been suggested that an extension of the prison-farm system, already started in some territories, would provide an open-air life and occupation more suited to natives than incarceration in prisons of a European type, and instruction in agricultural methods which would be more useful to them on release than training in trades.

The substitution of fines for the system of compensation which was the commonest feature of African custom has doubtless been one of the changes which the African mind has found it most difficult to accept. The wide recognition of native tribunals has to some degree eased the position; it may be assumed that the French *tribunal indigène*, in which local native custom takes the place of written law, also grants compensation. But the British colonial courts have not found it easy to give to the principle of compensation the place which the African might himself assign to it. It is true that East African codes allow for compensation being given in addition to or in substitution for any other punishment,² and that magistrates are advised to use it in all suitable cases. The Supreme Court Ordinance of Nigeria³ allows a court to stay proceedings in any case falling short of felony on payment of compensation, but in practice the procedure is little used. The law does not definitely enunciate the principle of granting compensation as a substantive penalty, and the attitude of some High Courts at least shows that they tend to the unpractical view that the injured party ought to resort to civil action to get compensation. It must again be noted that there is a growing field of offences in which compensation is in any case inapplicable, namely, the breach of health, sanitary, and other administrative laws. Though there is scope for considering a change in the law which would give further recognition to compensation as a principle in the criminal procedure, yet if most of the serious crimes and all the

¹ See Chap. XI, p. 676.

² Op. cit., Cmd. 4623, pp. 63-6.

³ *Laws of Nigeria*, cap. 3.

administrative offences have to be ruled out, the use of compensation can never have so large a place in the court system as has sometimes been hoped. The use of collective punishment, which is sometimes advocated as a natural corollary to African views of collective responsibility, is recognized by British law, but only as an emergency procedure. The Transkei Spoor Law¹ was the application of executive rather than judicial process; indeed, the insistence on collective punishment must always be a function of the administration rather than the judiciary.

VI. A FINAL NOTE

In dealing with the wide range of subjects included in this chapter, it has more than once been found necessary to suggest the institution of a special study of matters of principle or practice involved. The objective of such inquiries is, however, not merely the improvement of the legal, judicial, or penological systems in a technical sense. Whether any such system can be said to rest anywhere on an entirely logical basis is doubtful; it is on the other hand obvious that we have still the opportunity in Africa of considering questions of principle and their practical application, based on the only standard which we can now regard as properly applicable, namely, the social value of the institution we are creating. The impression left on the people affected must always be the most valuable element in a decision on any method advocated. The task, therefore, is not one in which the view of the technical expert can be admitted as decisive; the most valuable assistance will be given by those who are able to take a comprehensive view of the reactions of our legal system on those for whose benefit it is intended, and its capacity to evolve an answering contribution from African society.

CHAPTER VIII

THE NON-EUROPEAN IMMIGRANT COMMUNITIES

THE questions to which the existence of these communities gives rise are of a different class from those dealt with in the chapter on Native Administration; they originate not from the need of suiting administrative methods to the needs of African social life, but from the complication which such communities have added to the African racial problem. It is fortunate that this added complication is limited in extent. Small immigrant communities such as that of the Syrian traders in West Africa do not create a serious problem, the more so as this particular community readily assimilates itself to European conditions. Again, the existence of an Arab community in the Eastern coastal areas presents questions which, if they require some notice, cause little real difficulty. The most conspicuous problem is in fact that arising from the existence of the Indian community in South Africa and in the British East African territories; it may be noted that the Belgian policy has tended to prevent Indian entry into the Congo, and economic conditions have not favoured the immigration of Indians into French or British West Africa. It will be necessary to devote this chapter largely to the position now occupied by the Indian community, the more so as its history has more than once been marked by acute controversy, extending beyond the limits of the African territories concerned. The Indian government, in sympathy with its own legislature, has been in a position to afford strong support to many of the claims advanced by Indians in Africa, and the fact that Britain has no constitutional control over Union policy, and has also on occasion felt constrained to support the claims of European settlers against those of the Indians in East Africa, has created one of those positions of tension between different units of the British Commonwealth of Nations for dealing with which no machinery is readily available in the constitution of the Commonwealth.

I. THE ARAB COMMUNITY

The importance of the Arab immigration belongs largely to the past. By the twelfth century Arabs had established themselves in a number of points of trading vantage as far south as the Zambesi outlets. In the seventeenth century the Arabs of Oman, in south-east Arabia, ousted the Portuguese from a number of their stations in East Africa, and thus began the connexion between Oman and Zanzibar which lasted till the nineteenth century. In 1832 the reigning Sultan of Oman transferred his court to Zanzibar and extended his authority to parts of the mainland now included in Kenya and Tanganyika. Arab activity on the mainland showed itself chiefly in the opening up of trade routes and the vigorous expansion of the slave trade, accompanied by the spread of the Islamic religion and the Swahili language.¹ On the mainland the Arabs are to-day most prominent in Kenya, where the 1931 census recorded 12,166 Arab residents. Their position has been recognized by the nomination of an Arab to the legislative council, and the institution of separate Arab schools.² Both here and in Tanganyika their special form of land tenure has been recognized by government,³ and they have for the most part been brought under the jurisdiction of non-tribal courts.⁴ But the Arab has neither the political flair nor the aptitude for trade possessed by the Indian; unlike the latter, therefore, he seldom exhibits himself as a political or economic competitor to the European. Indeed, the readiness shown by less wealthy Arabs to assimilate with the Bantu seems to show that the Arabs are likely to occupy in the future a position of decreasing importance as a distinctive community.

II. THE INDIAN COMMUNITY

(a) *Historical*

There has been intercourse between India and Africa throughout history. A Roman hand-book to the navigation of the Indian Ocean mentions that trade in various commodities was then being carried on between East Africa and Kathiawar and Cutch on the

¹ See Chap. III, pp. 89-90.

³ Chap. XII, p. 848.

² Chap. VI, p. 165.

⁴ Chap. IX, p. 518.

west coast of India, and Marco Polo, in the thirteenth century, tells of 'the ships of Maabar which visit this island of Madeigascar and that other of Zanghibar'. When the Portuguese reached East Africa in the late fifteenth century, Indian traders were already there, and it was an Indian who piloted Vasco da Gama on his first voyage across the Indian Ocean. This Indian commercial community continued to prosper in Zanzibar throughout the seventeenth and eighteenth centuries, under both Portuguese and Arab rule; Captain Smee, who visited Zanzibar in 1811, reported that it then engrossed the greatest part of the trade. In 1861 Zanzibar came under British influence; a British Consul and Political Agent was appointed and British subjects came under the jurisdiction of a consular court administering Indian law, with an appeal to the High Court of Bombay. In 1863 there were 5,000 or 6,000 Indians in the island and on the mainland territories of the Sultan, and almost the entire trade of these territories, estimated at more than £1,500,000 annually, passed through their hands. These Indians were Mohammedans from Cutch, Surat, and Bombay, most of whom were permanently settled, and Hindu Banyas from Cutch and Jamnagar, who generally returned to India.

In view of this long historical connexion, it is not surprising that Indians emigrated in large numbers to Africa when the development of sea transport stimulated colonization, and large areas of Africa came under British rule. To-day there are large Indian communities in South Africa, Kenya, Uganda, Tanganyika, Zanzibar, and Portuguese East Africa. In smaller numbers Indians are to be found trading in the Rhodesias, Nyasaland, and in British Somaliland. It is proposed to deal here with the position of the Indian community in South Africa, Kenya, Tanganyika, and Uganda.

(b) *Indians in South Africa*

The attitude of the early Dutch settlers in South Africa towards racial questions is simply stated in a petition against Asiatic immigration addressed to the Republican government of the Transvaal in 1884. 'Our constitution', said the petitioners, 'recognizes only two races of men, white and coloured.'¹ It is clear that

¹ *Cambridge History of the British Empire*, vol. viii, 1936, p. 551.

both the English and the Dutch colonists, faced inevitably with a difficult native problem, regarded the Indian immigrant as a further and embarrassing complication. The Indian possessed a distinct and vigorous civilization of his own and he represented the danger of a limitless influx of Asiatics. He was a keen trader, with whom few Europeans could compete because of his lower standard of living. His sanitary standards were ordinarily below those of Europeans. From these elements there grew up a marked hostility against Indian immigrants, from which gradually developed a structure of political, economic, and social ostracism, designed to curtail the number of Indians in the country.

There were, however, circumstances which at all events in one territory of South Africa made the employment of immigrant Indians an economic necessity. The early planters in Natal experienced great difficulty in securing labour.¹ Africans were unused to employment for wages and the administration did not favour the employment of natives for wages; but labour was essential and India, which was then supplying labour to many colonial territories under the indenture system, was the obvious source from which to obtain it. In 1860 the Crown Colony government in Natal introduced the first Indian indentured labourers, although even at that time there seems to have been some opposition from Europeans other than the planters. These labourers proved satisfactory, and once the supply had begun the prosperity of the sugar plantations became dependent upon it. Immigration was suspended between 1866 and 1874, but the planters secured its renewal in the latter year, and the Natal government agreed to subsidize the government of India in respect of recruiting arrangements by £10,000 a year; from that time the introduction of indentured labour continued uninterrupted until 1911.² The right of recruitment was withdrawn in that year by the Indian government, which was moved to this step by the growing strength of opinion in India on the subject of the treatment of Indians in South Africa.

The indentured labourers were recruited by agents in India under agreements to serve on terms approved by the government

¹ See Chap. XI, p. 638.

² *Cambridge History*, op. cit., pp. 549-50.

of India for a period of five years. Thereafter their freedom was resumed and they could either enlist for a further term of indentured service, or return to India, or remain as free settlers in Africa. As the number of ex-indentured labourers who remained as free settlers increased, the opposition of the European population became intensified. In 1891 the Natal government ceased to make grants of land to ex-indentured labourers who stayed in the country, and sought, though without success, permission to recruit on terms which would allow compulsory repatriation. In 1893 Natal attained responsible government, and the objections of the European population immediately found expression in measures designed to discourage the settlement of Indian labourers. By an Act of 1895 every ex-indentured labourer who remained in Natal was required to take out each year a licence at a fee of £3.¹ Free passages to India were granted to those who returned immediately. Traders were required to obtain licences from the local authorities, and this requirement was used to restrict the number of Asiatic traders. In spite of these measures, however, a large proportion of ex-indentured Indians remained, and in 1903 pressure was intensified by the imposition of a £3 tax on the children of ex-indentured Indians on attaining the age of majority (which was 16 in the case of boys and 13 in the case of girls), a step which was described by the Indian Inquiry Commission² of 1914 as 'very drastic legislation'.

In addition to indentured immigration there was a constant flow of unassisted immigration from India and from East Africa. The hostility of the white population to this free immigration found violent expression in a demonstration at Durban in 1896, when a then obscure Indian lawyer named Gandhi narrowly escaped with his life. In 1897 the first measure limiting Indian immigration was enacted in Natal, by which all free immigrants were required to pass a language test in a European language.³

In other parts of South Africa opposition was directed against the Indian as trader, not as labourer. There was no restriction on the entry of Indians to the Cape Province, but the Orange Free State debarred all Asiatics from trading or farming in its

¹ *Cambridge History*, op. cit., p. 550.

² *Report*, Cmd. 7265, 1914, p. 27.

³ Act 1 of 1897.

territory.¹ In the Transvaal, as early as 1884 the Republican government received a series of petitions protesting against Asiatic immigration. As a result a comprehensive measure, Law 3 of 1885, was enacted. This law deprived Asiatics of citizenship and the right to own property, and required all Asiatics wishing to trade in the Transvaal to register, in the case of new entrants, at a charge of £3. It also empowered the government, for sanitary purposes, to set aside streets, wards, and locations for the habitation of Asiatics. This law introduced for the first time the principle of segregation which later became the chief demand of European opinion, but its provisions were never fully enforced by the Transvaal Republic. During and after the War of 1899-1902 there was a continued influx of Indians into the Transvaal.

Although the British government had protested to the Transvaal Republic against the imposition of disabilities upon its Indian subjects solely on grounds of race, the new British administration was forced by pressure of opinion to keep in being the Law of 1885. Moreover, when responsible government was set up in the Transvaal, it at once gave expression to local feeling on the Indian question. A European language test was imposed on all immigrants in 1907, and the Act included also a clause which had the effect of excluding all Indians seeking to enter the province for the first time. In order to prevent illicit immigration, all Indians claiming domicile in the Transvaal, and not as under the Law of 1885 those wishing to trade only, were required to register and to record their finger-prints.² These measures were the occasion of the first passive resistance campaign under Mr. Gandhi's leadership. The main grievances advanced were that the taking of finger-prints implied a criminal status, and that the immigration law excluded Indians, although British subjects, solely on grounds of race; but the movement was also a reaction against the prevailing attitude of Europeans in the Transvaal towards even educated Indians, as expressed in various forms of social discrimination in public places. The resistance took the form of refusal to register, and of deliberate breaches of the immigration law. Hundreds of Indians went to jail, and sympathy was aroused in India and in

¹ *Wetboek van den Oranje Vrijstaat*, 1891, Hof Hoofdstuk xxxiii, pp. 262 ff.

² Asiatic Law Amendment Act, 1907.

the United Kingdom, while grave embarrassment was caused to the administration. A settlement was ultimately reached by the government agreeing to exclude Indians by administrative regulations under a law which in form was applicable to all immigrants, and to insert provisions which would allow the admission of a strictly limited number of educated Indians each year.

With the formation of the Union in 1910 the immigration question passed into the hands of the central government, and in 1913 a general Immigration Act was passed.¹ This Act, in addition to the imposition of a European language test, enabled the Minister for the Interior to exclude any person or class of persons deemed on 'economic grounds or because of their standard and habits of life' to be unsuited to the needs of the Union. Under this provision all further Indian immigration was prohibited except for a strictly limited number of educated Indians annually, and the wives and children of Indians already domiciled in South Africa. The Act also prohibited the inter-provincial movement of Indians within the Union, except in the case of Indians already lawfully entitled to reside in any province at the date the Act was passed. Such Indians would be permitted to enter Natal and the Cape if they were able to pass the simpler language test prescribed under the provincial immigration Acts.

The passage of this Act led to an intensified campaign of civil disobedience, again under Mr. Gandhi's leadership. It was contended that the Act deprived Indians of free entry into the Cape Province, and that Indians working under indenture in Natal would lose their right to remain in the country as free settlers on conclusion of their service, and be liable to deportation. In addition, a judgement of the Supreme Court had laid down that marriages celebrated under the tenets of an Indian religion permitting polygamy were not valid in law in South Africa, even though the marriage were in fact monogamous. From this it appeared to follow that the wives of Indians could not be legally admitted under the new immigration law. The passive resistance campaign took the form of strikes by indentured labourers, and of wholesale breaches of the Transvaal immigration laws. Disturbances occurred in which lives were lost. Strong feeling was aroused in

¹ Immigrants Regulation Act, 1913.

India by allegations of ill-treatment of Indians arrested for such activities, and, mainly as a result of a suggestion of the Indian government, the Union government appointed a commission to examine the causes of the passive resistance campaign. This reported that the great majority of the Indian grievances were well founded. It proposed the abolition of the £3 tax in Natal, and changes of the law to meet the main grievances of the Indian community. It also recommended that machinery should be created for validating Indian marriages within the Union. Effect was given to these recommendations in their entirety in the Indians Relief Act of 1914. This Act also gave power to the Union government to repatriate voluntarily any Indians who, by a period of free residence, had lost their right to a passage under their indenture. As a result of this measure and of an agreement reached between General Smuts and Mr. Gandhi on certain administrative matters, the passive resistance movement came to an end.

The Immigration Act of 1913 terminated the entry of Indians into South Africa in any appreciable numbers. It was hoped that once the European population were assured that they were safe from any further large influx of Indians, their attitude towards the domiciled Indian would be modified. In the period following the War circumstances unfortunately produced the opposite effect. Industrial and trade depression restricted the available employment. During the War, Indians had increased in numbers in various industrial occupations, and their presence was regarded as an encroachment on the means of livelihood of the poorer sections of the white population. Some members of the Indian community in Natal and the Transvaal had become men of considerable wealth, and an outcry arose against Indian 'encroachment' in the sphere of property also. Between 1919 and 1925 measures were passed which further restricted the ability of Indians to acquire property, and a demand arose for the strict application to Indians of that policy of compulsory segregation, to which South Africa had begun to attach increasing importance as a solution of its racial problems.¹

In 1925 in response to this demand the Union government introduced the Areas Reservation and Immigration Restriction Bill, the main intention of which was to implement a policy of resi-

dential segregation. Although drafted as a measure of general application, the Bill was mainly aimed at the Indian community, as was shown by the speech of the Minister of the Interior, who, in introducing the measure, said: 'The Bill frankly starts from the supposition that the Indian as a race in this country is an alien element in the population, and that no solution of this question will be acceptable to the country, unless it results in a very considerable reduction of the Indian population.' Witnesses from the municipal authorities supported the Bill on the main ground that it was repugnant to Europeans to live in proximity with Indians, and that the occupation of premises by Indians in European areas led to depreciation of the neighbouring property and so to Indian penetration. The Durban witnesses reported difficulty in securing compliance with sanitary regulations by the Indian population and stated that nine out of ten prosecutions under the sanitary laws were against Indians. The witnesses for the Indian community and delegates from the government of India, who were permitted to give evidence, contended that the Indian trader in cheap goods was a benefit to the native and to the poorer white community, and that in so far as Indians gave trouble in sanitary matters this was due to poverty and lack of education. They appealed further to the fact that Indians had, in the great majority of cases, been brought to South Africa by the government of Natal, which needed their labour, and that, once they had legally acquired domicile, they were, as subjects of the Crown, entitled to fair treatment within the Union.

In 1927 a conference¹ was held between representatives of the Union government and the government of India, which resulted in what is known as the 'Capetown Agreement'. The Union government undertook not to proceed with the 'Areas Reservation Bill', while the government of India promised co-operation in a 'Scheme of Assisted Emigration' for South African Indians. Under this scheme free passage and a bonus of £20 were given by the Union government to every adult Indian who wished to return to his own country. The government of India undertook to assist the returned emigrants to settle in India. While the agreement recognized the right of the Union government to take steps

¹ *Official Year Book of the Union of South Africa*, 1937, pp. 1062-3.

to maintain western standards of life, it recorded their acceptance of the view that the condition of Indians domiciled in South Africa should not be allowed to drop behind that of the rest of the community. In particular the Union government promised an inquiry into Indian education, and into housing conditions in the densely populated Indian areas in and around Durban. The agreement provided for the appointment of an Agent to the government of India in South Africa, through whom the two governments would maintain touch in regard to matters affecting the Indian community. Some 15,000 Indians were repatriated under the agreement between the years 1927 and 1935. The Union government were, however, disappointed by the numbers who left the country, and in 1932, when a further conference was held, they proposed that the possibilities of an emigration scheme to other territories in the Empire should be explored.¹ It was agreed to hold such an inquiry, and on this basis the 1927 agreement was reaffirmed, and still remains in force, although no additional scheme of emigration has yet been agreed upon.

The Asiatic population in the Union in 1936,² of whom the great majority were Indians, was 219,928—less than 1/9th of the European population, and approximately 1/43rd of the whole. In 1921 the Asiatic population was 165,731.³ In fifteen years it had increased by 32·70 per cent., as compared with an increase in the European population of 31·85 per cent. The proportion of the Asiatic to the European population consequently remains substantially unchanged.⁴ A comparison of the figures of provincial distribution of the Asiatic and European population at the 1921 and 1936 census compilations shows that in Natal, where 183,646 out of the total Indian population of 219,928 reside, the European population, which was outnumbered by the Asiatic in 1921 by about 5,000, now outnumbers the Asiatic by nearly 7,000.⁵ In the Transvaal and the Cape the Asiatic population is no more than 3 per cent. and 1·3 per cent. respectively of the European com-

¹ *Official Year Book of the Union of South Africa*, 1937, pp. 1063-4.

² *Census 1936, Preliminary Report*, U.G. 50, 1936.

³ *Official Year Book*, 1937, p. 1060; 1928-9, p. 892.

⁴ The figures for 1921 and 1936 are not strictly comparable, since Syrians, who were classed as Asiatics in 1921, were classed as Europeans in 1936. The numbers involved are, however, very small.

⁵ *Official Year Book*, 1937, pp. 1046, 1060.

munity, and in the Transvaal is not entirely Indian, as there are about 2,000 Chinese.

In Natal the great majority of the Indian population are ex-indentured labourers and their descendants. They are employed in considerable numbers on sugar and tea plantations. There are about 700 Indian sugar planters in Natal cultivating independently, but most of them are on a very small scale. Indians have also taken to small-scale farming and market gardening on an independent basis and have found employment in a great variety of industries. The census of 1921, which is the latest from which occupational statistics for the Asiatic population are at present available, showed that in Natal some 20,000 Indians were engaged in agriculture, 6,400 in industry, 3,000 in transport, and 5,700 in trade. Only 436 were engaged in professions, and 261 in public administration.¹ In the Transvaal and the Cape the majority of Indians are engaged in trade.

In the past the Indian, by providing cheap and reliable unskilled labour, played an important part in building up such industries as coal-mining, and helped to fill the gap between the European and native populations by engaging in artisan occupations. Economic changes in the Union have brought into existence a poorer class of Europeans who seek employment in the sphere of skilled and unskilled labour. The 'civilized labour policy', officially adopted by the Union government, prescribes the gradual replacement of Indian and coloured workers by Europeans in all suitable government and municipal employment.² It has been more rigidly applied by the government than by municipalities, but has resulted in a reduction in the employment of Indians by both, and has by the force of example produced similar results in private industry. On the other hand, although his opportunities have been reduced, the conditions of work of the Indian industrial labourer have improved in recent years as a result of the Industrial Conciliation Act of 1924, and the Wage Act of 1925. In several industries in Natal, Indians have since 1927 been admitted to the trade unions, which previously had been confined to Europeans. It is doubtful, however, whether this

¹ *Official Year Book*, 1937, p. 1061.

² See Chap. XI, pp. 682-9.

latter fact is to be attributed to local trade conditions, or can be taken as a proof of the existence of improved relations between the two races since the Capetown Agreement.

In trade the activity of Indians extends to all provinces except the Orange Free State, and to all classes of retail trade, from hawking to large urban stores, with branches in the country districts. The clients of the small Indian shopkeepers are chiefly natives and the poorer members of the white community, but in some towns, such as Johannesburg and Durban, there are big stores owned and managed by Indians which have substantial European custom, and in many cases employ European assistants. In the early days the Indian trader was able to take trade out of the hands of Europeans because he could trade successfully on a small margin of profit and a lesser turnover than his competitors; it was on ability to do so that he justified his claim of usefulness to the poorer section of the community, both European and native. But this trade competition contributed powerfully to the development of anti-Indian sentiment, and has been one of the real causes underlying the demand for segregation. It is not easy to determine whether the fear of Indian trade competition is less intense than it was. The evidence given before the Feetham Commission in the Transvaal in 1934 on this subject was conflicting. The chairman of the Johannesburg City Council, for example, stated that there was 'no desire on the part of Europeans in the centre of the town to eliminate Indians trading as such. I think they get on very well together.'¹ On the other hand, in some of the smaller towns of the Transvaal, such as Springs and Krugersdorf, Asiatic trade competition was said to be severely felt. If the intensity of opposition to Indian trade has lessened in some areas, it is probably the result of the effective restraint which has been put upon Indian trading activities through the licensing laws, and in the Transvaal through legal restrictions on the ownership of property. Before dealing in more detail with such matters it is desirable to assess the political position of the Indian community in South Africa.

Except in the Cape, where anti-Asiatic sentiment has never been so strong as in other parts of the Union, and where Indians are

¹ *Report of the Transvaal Asiatic Land Tenure Act Commission, Parts I and II, U.G. 7, 1934, p. 137.*

still eligible both for the provincial and the municipal franchise, the Indian community has no political representation.¹ They have never possessed either franchise in the Transvaal, and in Natal they lost the provincial franchise in 1897, the franchise in boroughs in 1924, and the townships franchise in 1925, with the exception of those whose names were already on the rolls. The South African Indian Congress, a voluntary organization, is the recognized mouthpiece of Indian opinion, and opportunity has been given to this body to make representations to the governments of the Union and the provinces on many matters. It has, however, supported the policy of voluntary emigration from South Africa, and recently a separate organization, the Colonial Born and Indian Settlers Association, has come into being, which actively opposes the Union government's policy of seeking reduction of the Indian population by emigration.

The community has on more than one occasion received substantial support from the representations made on its behalf by the Government of India. In the inquiries held in 1914 and 1921 into the Indian question, and in the case of the Parliamentary Committee on the Areas Reservation Bill of 1925, the Indian government were permitted to send representatives who gave evidence in the interest of Indians, and at subsequent inquiries of this kind the views of the Indian government have been expressed by the Agent to the government of India. In spite, however, of these means of voicing their grievances, the lack of any political representation either in the provincial legislatures or in the municipalities deprives the Indian community of any effective voice in administrative and legal matters which affect their interests. Of these the most important are the administration of the licensing laws, and in the Transvaal the law relating to ownership of property. Licences to trade are required in every province, and although the law does not discriminate against Indian or coloured applicants as such, in practice the licensing system has been used to restrict Indian trading and to confine it to certain areas.

In Natal, licensing officers for urban areas are appointed by municipal authorities and appeals lie to the municipal authority

¹ See Chap. VI, p. 154.

itself. The courts are expressly excluded from jurisdiction in licensing matters, although there is an appeal to the Natal Supreme Court when the renewal of a licence is refused;¹ it is, however, difficult for an Indian to establish a case on the somewhat narrow grounds on which the court will admit an appeal. In the past the licensing authorities have admittedly used their powers to restrain Indians in the pursuit of trade. The Licensing Officer of Durban, for example, giving evidence in 1921 before the Asiatic Inquiry Commission, stated that 'A European licence is granted as a matter of course whereas an Indian licence is refused as a matter of course if it is a new one.' In 1925 the same officer stated that his policy, which had the support of the town council, had had the effect of gradually segregating Indian trading premises in the Grey Street area of Durban.² In rural areas in Natal licences are issued by a licensing board, appointed by the Administrator under an Ordinance of 1923, and there is an appeal to the Provincial Licensing Board only when refusal is on the ground that the applicant is not a fit and proper person to receive a licence. An amending Ordinance in 1935 gave power to refuse a licence on the ground that to grant it would depreciate adjacent property.

In the Cape, licences are issued on certificates from the local authorities themselves, and since Indians have the local franchise their interests are better protected. In the Transvaal a certificate of fitness must be obtained from the local authority before a licence can be issued. The Transvaal Licences Control Ordinance of 1931 gives complete discretion to the local authority as to the grounds on which certificates of fitness may be refused, and thus excludes any appeal to the courts on the ground of improper refusal. As in Natal the licensing law is admittedly used in such a way as to limit Indian trading. As recently as 1936 a municipal witness before the Select Committee on the Transvaal Asiatic Land Tenure Amendment Bill stated that³ 'Municipalities throughout the Transvaal have in the past consistently endeavoured to carry out the policy of the Transvaal to keep the coloured person separate from the white by refusing to grant trading licences to Indians.'

¹ Act 22 (Natal) of 1909.

³ *Report of Select Committee*, Q. 124, p. 109.

² *Minutes of Evidence*, Q. 1503.

The ownership and occupation of property is another matter in which Asiatics are subject to discrimination. In Natal there is no legal bar to the holding of land by Indians, and considerable property is owned by them; but the Natal municipalities have power to subject sales of land belonging to them to racial restrictions, and many private sales of land have been made subject to provisions precluding subsequent transfer to Asiatics. In the Transvaal, Indians and other Asiatics have been debarred from owning property since 1885, but up till 1919 they found a means of doing so through trustees or through land-holding companies. In addition there are special restrictions on the occupation of land by 'coloured persons' in areas proclaimed as public diggings under the Gold Law and the Townships (Amendment) Act of 1908. These were not, however, strictly enforced, and Indians in illegal occupation of such stands were given protection from eviction in 1919.

In 1930 it was found that there were still illegal occupants of such land; many of those who had been protected by the 1919 Act had since lost that protection by moving their premises or in other ways. A Select Committee of the Union legislature was set up to examine the question of the illegal occupation of such land, and their deliberations resulted in the Transvaal Asiatic Land Tenure (Amendment) Act of 1932. This Act gave power to the Minister to exempt from the provisions of the Gold Law selected land in the proclaimed areas. A commission presided over by Mr. Justice Feetham sat to make recommendations as to exemptions to be made under this Act, and in 1936 a further Act gave the right of ownership as well as of occupation of property to Indians in the 'exempted areas'. The areas which will come under the exemption clause have still to be announced. The Act also gives to the Union Minister for the Interior power to take measures to ensure proper municipal administration of the exempted areas, since it has been found in the past that, owing to the absence of Indian representation, municipal bodies tend to allow areas inhabited mainly by Indians to fall behind the rest of the land under their control.

As agreed at the Capetown Conference the Natal government appointed a committee to inquire into the facilities for Indian

education in the province. It considered that the existing facilities were inadequate, and proposed that the whole of the proportion of the Union government's subsidy paid to Natal in respect of Indian attendances, some 30 per cent. of which had previously been diverted to other purposes, should be spent on Indian education. It also suggested the extension of grant-aided schools, and the provision of government schools for Indians in the main centres of Indian population as soon as funds became available. The recommendations of this report were adopted, with the result that expenditure on Indian education in Natal has steadily increased.¹ Between 1926-7 and 1934-5 expenditure rose from £28,430 to £86,000, and school enrolments increased in the same period from 9,330 to 18,084. In 1934-5 the Natal government allotted £19,000 towards Indian education in addition to the Union government subsidy. In 1935 the distribution of milk to school-children was extended to Indian schools. During the same period educational facilities for Indians were considerably increased in the Transvaal.

The development of Indian education has been facilitated by the opening of Sastri College in Durban in 1929. This college was built at a cost of £20,000 by private subscription raised among the Indian community, on the initiative of Mr. Sastri, the first Agent of the government of India in South Africa. Although constructed at private expense the Natal government has accepted financial responsibility for it. Further provision has recently been made for secondary and higher education for Indians by the opening of a joint secondary school for Indian and coloured pupils at Johannesburg, and by a grant given by the Union government in 1935 for continuation schools and commercial education for Indians in Durban.

Housing is a matter in which the Indian community has benefited considerably since the Capetown Agreement. The housing conditions of the poorer class of Indians were at one time extremely bad. The Medical Officer of Johannesburg in 1904, writing of the Indian population of the town, which was then 1,677, pointed out that few lived in decent private houses, while Indians of the lower classes lived 'more or less crowded together in small

¹ See Chap. XVIII, p. 1213.

ill-constructed rooms lining courtyards which are often narrow, strewn with refuse and much befouled with slops and washing water'.¹ The habits of these Indians, according to the Medical Officer, were a serious danger to the health of the town. These conditions may be contrasted with those described to the Feetham Commission by the Medical Officer of Health as prevailing in Johannesburg in 1933. 'Asiatics are generally of the trading class and live in the back quarters of trading premises. In these circumstances they are as amenable to sanitary requirements as the average European of the poorer class, and, at times, are an example to such Europeans. . . . One can honestly say that these Indian tenants have co-operated in good faith and with alacrity with this Department in bettering housing conditions.' The inquiry into Indian housing in Durban, which was promised by the Capetown Agreement, showed that while much had been done by the Durban corporation in regard to housing for Europeans, little had been done for Indians. The difficulty arose partly from lack of land within the borough, but all sales of municipal land within the borough made between 1922 and 1928 had been restricted to Europeans. In regard to conditions in the areas outside Durban, where the majority of Indians resided, the report held that the bad conditions were frequently due to the inability of Indians to secure the freehold of their property, the worst conditions being found in short-lease property. In 1932 these areas were incorporated in the borough of Durban, and since that time action has been taken under the Slums Act,² and by the enforcement of sanitary regulations, which has brought about considerable improvement. The Agent to the government of India stated in 1936 that 'in spite of the fact that considerable improvement remains to be done, the living conditions have improved very much, substantial buildings have been erected, and the conditions generally are very satisfactory indeed'.

In social matters the Indian community in South Africa keeps very much to itself. There is, generally speaking, no social intermixture with Africans, nor does it seem that Indians have yet begun to occupy the position as leaders of native African opinion which was at one time thought likely. In common with other

¹ See *Report*, op. cit., U.G. 7, 1934, p. 135.

² Act 53 of 1934.

coloured people, Indians are required to use special compartments in trains, special counters in post offices, and are excluded from the better seats in places of entertainment. Some shops and restaurants refuse to serve coloured persons. In spite, however, of such racial differentiation, the Indian community has materially improved its social position in recent years. Successive Agents to the government of India have set themselves to encourage Indians to show, in practical form, their desire to improve their own standards of living and to take part in activities for the welfare of the Indian community and the public as a whole. The first notable example was the raising of £20,000 by Indian subscription for the building of Sastri College. Further instances have been the raising of relief funds to assist Indians distressed as a result of the flooding of a Durban suburb, and Indians unemployed through the trade depression in 1931. Donations have recently been made by wealthy Indians for the erection of Indian wards in the hospitals at Johannesburg and Pietermaritzburg; in 1935 the Indian and Malay communities jointly contributed £2,000 to the Groot-Schur Hospital Equipment Fund. An Indian Child Welfare Association and an Indian women's branch of the Red Cross have been formed. These are examples of a new outlook which is being strengthened by the increasing number of South African Indians who have been born and bred in the country, speak no Indian language, and regard the country as their home.

It will have been seen that in many respects the Indian community has improved its position since the Capetown Agreement of 1927. Apart from the question of provincial and municipal representation, and the existence of social discriminations, the disability now most keenly felt by Indians is the discriminatory use of the licensing laws, and the Transvaal restrictions on the holding of property. The course of events since the Capetown Agreement has shown an increasing desire on the part of the Union government to find, subject always to the maintenance of its 'civilized labour' and segregation policies, the means of removing Indian disabilities. But the former prejudice against Indians dies hard, and there is still a body of opinion in the Union which favours further Asiatic legislation. This opinion is strongest in the

Transvaal and showed itself during 1936 in the promotion of three private members' Bills in the Union legislature, which were the first attempt to impose further disabilities on Indians since the Capetown Agreement. These Bills were designed to make it impossible for a valid marriage to be contracted between a European and a coloured person, to empower provincial legislatures to prohibit the employment of Europeans by non-Europeans, and to prohibit the ownership of fixed property in the Transvaal by non-Asiatic wives of Asiatics, and by the children of such wives. The first Bill was not taken into consideration when it was shown that the number of such unions was negligible; the other two were considered by a select committee and have not been proceeded with. The promotion of these Bills may not unreasonably be taken as an example of the tendency to make capital out of the Asiatic question for political purposes.

As for the future, the political pressure which is based on the competition of Indians as traders will no doubt vary with the economic circumstances of the moment; that due to social policy, manifesting itself in the principle of racial segregation as a means of maintaining an unchallenged field for European standards of life, would seem to depend on the ability of the Indian community to adjust itself more closely to European conditions. Experience in India has shown that, while Indian civilization is strongly tenacious of its religious life and some aspects of its social customs in face of outside influences, Indians readily adopt the European manner of living, and standards of education, sanitation, and the like, where their economic conditions permit them to do so. There is, on the other side, among more informed elements in the Union a growing appreciation of the real nature of Indian culture; and even in a wider circle there is some realization that the standards of Indian life cannot be judged by those of the Natal indentured coolie. But perhaps the most potent factor which is likely to affect the future relations of Europeans and Indians is the recognition that the latter are ceasing to be an immigrant body, and comprise increasing numbers who have been born and educated in the Union, and whose attention is directed less to the requirements of Indians as a separate community than to the attainment of Union citizenship.

(c) *Indians in Kenya*

From early days Indians played a considerable part in the development of East Africa. They controlled the greater part of the trade of the whole coast, and the British East Africa Company contemplated Indian settlement on a very large scale. They have continued to play an important part under British rule. Indian troops were employed in its conquest, and Indian traders have been mainly responsible for conducting trade with the native population. The Uganda Railway was constructed almost entirely by Indian labour. At one time as many as 18,000 Indians were employed on the work, and, though most returned to India, some remained and settled as market-gardeners at Nairobi and on the coast as cultivators, and as artisans and traders. From 1900 onwards considerable immigration of traders and artisans from India to Kenya took place, and to-day the Indian community is the largest element in the non-native population of the colony. Its growth, as compared with that of the European community, is shown by the following statistics:

TABLE IV
Growth of Indian and European population

	<i>Indian</i>		<i>European</i>	
	<i>Number</i>	<i>Percentage of non-native population</i>	<i>Number</i>	<i>Percentage of non-native population</i>
1911 . .	10,651	44.1	3,175	13.1
1921 . .	22,822	50.0	9,651	12.1
1926 . .	26,759	49.9	12,529	23.3
1931 . .	39,644	53.6	16,812	22.7
1936 . .	38,325*	..	18,269*	..

* Estimated figures.

On the basis of the 1931 census it would appear that more than half of the Asiatic population is engaged in commerce. Industrial occupations take second place, while the residue is mainly employed in government and domestic service. The Indian trader has played a conspicuous part in the economic life of the East African territories. His ability to trade on a small turnover made it possible for him to carry imported goods into remote native areas,

where in early days he bartered them for native produce. By doing so he stimulated the wants of the native population and consequently their productive efforts. The keen trading sense of the Indian has, however, hitherto had the effect of keeping trade out of the hands of Africans, and to-day the Indian is still, outside the large towns, the principal distributing agent. In industry Indians are chiefly employed as artisans, and in such positions they have provided an element which, until recently at any rate, could not have been provided from the native population, and discharged services which the European population does not desire to perform. In agriculture Indians are few and declining in numbers. They engage in market-gardening, and sugar is grown by about forty-eight Indian planters at Kibos, who produce about 30,000 tons a year, a substantial proportion of the total production.

In Kenya the differences between the European and Indian communities, which have at times taken a very acute form, have centred mainly on three questions: the reservation of land in the highlands, the proposal to segregate Indians in urban areas, and the grant of representation to them in the legislature. An account will be given elsewhere¹ of the decision taken in 1902 to encourage the permanent settlement of Europeans in Kenya, and of the steps taken from 1906 onwards to reserve the highland areas for European occupation. Here it will suffice to note that in 1908 Lord Elgin announced the decision that 'while legal restrictions should not be placed on any section of the community, as a matter of administrative convenience grants of land in the uplands should not be made to Asiatics'.² The Crown Lands Ordinance of 1915 did not forbid Indians to acquire land anywhere, but in disposing of Crown lands in the highlands it is, in practice, stipulated that the buyers must be of European extraction; transfers between persons of different races have required the sanction of government.³ This decision has been strongly resented by Indians. The government of India has contended on their behalf that there are already enormous areas in other parts of the Empire from which they are totally excluded and that they have a special claim to equality of treat-

¹ See Chap. XII, pp. 820-2.

² *Tenure of Land in the East Africa Protectorate*, Cmd. 4117, 1908, pp. 25, 33.

³ See Chap. XII, p. 747.

ment in East Africa by reason of their early association with the country, and the part they have played in its development.¹

In addition to reserving the highlands to Europeans it became the practice from about 1912 onwards to impose as a condition of sale of a certain area of residential land in towns a covenant that it should not be occupied by any person not a European, and in some cases sales of such property were restricted to European bidding. This in effect introduced a type of residential segregation which was strongly opposed by the Indian community.

In the years immediately following the War there was a marked increase of anti-Indian sentiment among the European community. This resulted partly from a belief that there had been a large increase in Indian immigration, which aroused fears that the European community would be overwhelmed, and partly from the fact that Indian traders had made considerable profits during the campaign against German East Africa. A local economic commission which reported in 1919² made references to Indians as less civilized than the African in matters of sanitation, and as marked by a moral depravity which was inimical to African advancement; the commission accordingly demanded the limitation of further Indian immigration. Although this part of the report was repudiated by Lord Milner, the Secretary of State for the Colonies, it added to the bitterness of the Indian community. Lord Milner formally adopted a policy of racial segregation in residential areas in towns, but he ordered that there should be no discrimination against Indians in the immigration restrictions and that land outside the highlands of adequate extent and quality should be set aside for Indian settlement.³ These decisions led to representations by the government of India, which had become fully alive, as a result of events in South Africa, to the reaction of public opinion in India to the treatment accorded to Indians in Africa. In 1923 the British government issued a statement on their policy in regard to Indians in Kenya,⁴ to the principles of which it still adheres.⁵ This statement confirmed the policy of Lord Elgin in regard to the reservation of the highlands; the

⁴ *Op. cit.*, Cmd. 1922, 1923.

⁵ House of Commons *Official Report*, Nov. 10, 1937, c. 1752.

policy of residential segregation was abandoned, and it was laid down that restrictions upon immigration should be such only as were required by economic considerations and the interests of the African population.

The Indian agitation for representation on the legislative council, leading up to the grant of such representation on the basis of separate communal elections, has been already described.¹

Since 1923 the tension between the European and Indian communities has sensibly relaxed. In regard to immigration the position since 1923 has been that any British subject who is not an undesirable, and who can satisfy the Immigration Officer that he has means of support, can enter the country. Although the restrictive covenants already in force in respect of urban properties in 1923 have been maintained, the areas thus reserved to Europeans are comparatively small, and while Indians object in principle to the maintenance of these restrictions the matter is now of no great importance. The reservation of the highlands is, however, still a source of resentment to the Indian community, but it must be noted that for some years after Lord Milner's dispatch of 1920, land outside the highlands was kept available for Indian agricultural settlement, though there was apparently no demand for it. It may reasonably be doubted whether there is any considerable body of Indians who wish, under present conditions, to take to agriculture; the question seems at this stage to have become largely one of status.

The attacks made by the settler element on the Indian community have in the past often been of a nature which it is difficult to justify. The social relationship of the Indian and European communities has, however, never been as strained as it has been in South Africa. Social segregation exists to some extent. European clubs and hotels are for instance not open to Indians, even if they are well educated. There has, however, never been in Kenya such neglect of the interests of the Indian community in the administration of social services as prevailed in South Africa up to the time of the Capetown Agreement. Provision is made for the Indian population in the state medical service. In 1936 there were 73 Indian schools, 13 of which were maintained by the

¹ See Chap. VI, pp. 164-70.

government and 51 of which were aided from government funds. These schools had an enrolment of 7,227, and 3 of them provided education up to the Cambridge Junior and School Certificate examinations.

In a community in which special services have to be provided for different sections of the population, it is of importance to establish the extent to which the financial burden of administration falls on each section. This was one of the terms of reference to Lord Moyne, when he was appointed as commissioner to examine the finances of Kenya in 1932. On pages 1456 ff. of Chapter XX some considerations are given regarding the value to be attached to figures¹ prepared to illustrate the contribution of different communities to general revenues. Lord Moyne's figures are given subject to those considerations.

TABLE V

	<i>Contribution</i>	<i>Expenditure on community services</i>	<i>Contribution to indivisible services</i>
	£	£	£
European . . .	665,781	171,247	494,534
Asiatic . . .	385,658	46,080	339,578
Native . . .	791,100	331,956	459,144

Although the Asiatic contribution to indivisible services is 88 per cent. of its total contribution to revenue, the contribution to these services per head of the adult Asiatic population works out at £10 3s. per annum as compared with £40 per head per annum for the adult European population. Lord Moyne's conclusion was that as between the Asiatic and European communities the incidence of taxation was fair.²

Although in the economic sphere the interests of Indians have not come into serious conflict with those of other communities in the past, there are signs that in the future they may do so to a greater extent. In some measure this is due to the commercial character of the Indian population, since the interests of the producer may conflict in any community with those of traders.

¹ *Report by the Financial Commissioner on Certain Questions in Kenya*, Cmd. 4093, 1932, pp. 63-7.

² *Ibid.*, pp. 24 ff.

Indian witnesses before Lord Moyne's inquiry made representations against the protective tariff, and it is obvious that protection is contrary to the direct interests of importers, although they may benefit indirectly by the increase in the purchasing power of the producers. Another example of divergent interests is the control of the marketing of native produce introduced in 1935.¹ The object of this control, which has its precedent in other colonies, is, by the prevention of indiscriminate buying by large numbers of small purchasers, and by a system of regulated markets, to ensure that proper prices are given and that a satisfactory standard of produce is maintained. Such measures are designed to assist in building up a reliable export trade, but it is admitted that they involve some immediate loss to small traders, most of whom are Indian. Indians have, not unnaturally, opposed these measures, but it is not unreasonable to hold that they will, if successful in promoting the prosperity of natives, bring an increase in purchasing power which will more than compensate traders for their loss through the control of marketing.

It is, however, possible that in the near future Indians will have to face more substantial difficulties. The gradual increase in the number of educated Africans is bound to result in increasing competition with Indians. The Indian in East Africa has established a higher standard of living than he possesses in his own country, and educated natives will have little difficulty in competing with him once they have acquired the necessary capacities. Moreover, the number of Europeans willing to enter the better classes of clerical and manual employment is increasing also. Even in the commercial sphere it is not impossible that Africans will learn to compete successfully in small trade, and it is clear that there can be no legal or administrative protection from African competition.

(d) *Indians in Tanganyika*

Here Indians hold a position materially different from that in South Africa or Kenya, in that the terms of the mandate secure them against any form of administrative discrimination. The Germans had early recognized the economic value of the Indians

¹ See Chap. XX, p. 1422.

as traders, and, subject to the payment of a deposit, Indians had been freely admitted to the protectorate; at the date of the War a large part of the retail trade was in their hands. With the end of the War, their economic position greatly changed, for they managed to secure a considerable proportion of the German lands sold by the British government, and largely took the place of German firms in the import and export trade. They now hold some 282,843 acres of land as against 675,153 held by British and 453,611 by Germans.¹ The Indian population has increased considerably since the War; in 1921 there were 9,411 Indians against 2,447 Europeans; in 1931 the numbers were 23,422 and 8,228 respectively, and some 700 to 1,000 Indians have entered the country since 1931. Practically all the retail trade of the country and the major part of the import and export trade are now in their hands; as land proprietors and owners of ginneries they are large employers of African labour, and they are said to provide 30 per cent. of all the capital invested in agriculture. In 1937 about 1,000 Indians were employed in the lower grades of government service. Indians have combined to form a strong Indian Association with numerous local branches, and issue their own newspapers. They are represented in the legislature by three out of the ten unofficial nominations; it is contended that this is less than their proportion in relation to Europeans would warrant; but the point is unlikely to assume importance until the question arises of substituting election for nomination.

There are no considerable sources of friction between the Indian and other communities, although the introduction of native marketing control similar to that in Kenya and Uganda met with some opposition from Indians.²

Indian education in Tanganyika is well developed. An advisory board of 4 Hindus and 6 Mohammedans assists the administration in dealing with Indian educational questions. There are 3 government Indian schools and 53 non-government schools, 11 of which receive grants in aid from government funds. The government schools accommodate 700 pupils, while the non-government

¹ *Tanganyika Territory Department of Lands and Mines, Annual Report, 1936*, p. 6.

² *Report by H.M. Government to the Council of the League of Nations, 1937*, p. 82 and (for the position of Indians in the Territory) p. 72.

schools have a total attendance of 3,700. The principal school is the government Indian Central School at Dar-es-Salaam, which was opened in 1928, half the original estimated cost of £6,000 having been raised voluntarily by the Indian community. This school takes its best pupils up to London Matriculation standard.

(e) *Indians in Uganda*

It was estimated in 1935 that there were in Uganda 14,860 Asiatics and 1,994 Europeans. The Asiatic population, which includes a number of Arabs and Goans but is predominantly Indian, has increased slowly but steadily since the War. About 60 per cent. of the Indians in Uganda are permanently settled in the protectorate. The great majority of them are engaged in commerce, and it has indeed been calculated that as much as 90 per cent. of the total trade is in their hands,¹ but Indians also play a part in agriculture and industry. In 1935 there were 58 Indian estates, with a total area under cultivation of 21,306 acres, as compared with 223 European estates cultivating 22,564 acres. Recently an Indian firm has founded and developed a large sugar estate; there are two Indian sugar factories, with a joint output of about 10,000 tons per annum. Out of 194 cotton ginneries about 150 are Indian-owned, and in 1930 68 per cent. of the cotton crop was handled for export by Indian firms, as compared with 8 per cent. by European firms. Many Indians are employed in these ginneries, and they are also widely employed as artisans and clerical workers.

The main product of the protectorate is cotton, which constitutes 81 per cent. of the export trade; 91 per cent. of this is shipped to India. In the development of this trade, and in the distribution of imported goods from all sources, the Indian trader has been an essential medium. But, as in Kenya, the large number of these small middlemen has proved in modern conditions to be to some extent a handicap. The Uganda administration were the first in East Africa to adopt a system of licensing to control the purchase of cotton, but the control exercised in early days was not very strict. In May 1935 the Governor of Uganda said that in consequence of this laxity in earlier days 'there are to-day 194 ginneries in

¹ W. Fitzgerald, *Africa*, 1934, p. 246.

Uganda, where 50 would be sufficient to handle the crop, and this fact, combined with the activities of large numbers of middlemen buyers, has resulted in reckless competition in buying, involving . . . the mixing of different grades and qualities of cotton in the ginning process and other evils highly detrimental to the industry'.

To avoid similar developments in other industries the Uganda government promulgated in 1932 an 'Ordinance to control and regulate the Marketing of Native Produce'. This ordinance was on similar lines to the Kenya Ordinance already referred to. It was opposed by Indians for reasons similar to those advanced in Kenya.

The relations of the Indian and European communities in Uganda are good. There are no sources of political friction, and there is no discrimination in regard to land or residential conditions. The executive council of the protectorate is entirely official, while on the legislative council two representatives of the Europeans and two from the Indian community have been appointed by nomination. The question of representation was the source of some discontent between the years 1920-5 when the Indians had only one nominated seat; they then contended, though without success, for a franchise based on education and property qualifications applying to all alike. There is no differentiation between the different non-native races in Uganda in regard to taxation. There is a 'Uganda Association' which holds regular lectures and discussions in which Indians participate with Europeans and Africans on equal terms.

Indian education in Uganda is supervised by an Advisory Council of Indians presided over by the Director of Education. There are two government Indian schools, which work up to the standard of the Cambridge University Junior Entrance. In addition there are thirty-three Indian-owned schools which are aided from public funds. For higher education, Indian children are usually sent to India. The cost of Asiatic education is in part financed from the proceeds of an education cess of 20s. per annum, levied and spent upon the Asiatic population.

So far as South Africa is concerned, the position of the Indian community must be viewed largely in the light of its relations to

the European population in the economic and social field. But in areas such as Uganda and Tanganyika its future must be regarded rather as conditioned by the advance made by the native African population. The African has already invaded some of the fields of employment which the Indian at first occupied without challenge; natives are now employed largely on the railway, in postal and telegraph offices, and in an increasing number of subordinate posts in the administration.¹ The governments have not unreasonably committed themselves to give preference where possible to Africans over Indians in certain lines of employment, a policy which has already caused some apprehension among Indians. It has been suggested, when dealing with Kenya, that the position of Indians as traders may also be affected. This, however, must be viewed as a somewhat later development. Everywhere in South and East Africa the African has hitherto shown a singular unreadiness to engage in trade, and the Indian, as compared with the African, not only has a highly developed capacity as trader, but his connexion with India renders large supplies of capital readily available to him.²

Hancock, *Problems of Nationality, 1918-36. Survey of British Commonwealth Affairs*, Vol. 1, pp. 166-249.

CHAPTER IX

NATIVE ADMINISTRATION

I. INTRODUCTION

IN their annual reports most African governments treat of their administrative activity under two headings, 'general' and 'native' administration. The latter term has acquired a special significance, peculiar to African conditions. Its use originated in circumstances in which governments primarily concerned with the interests of European colonization found it necessary to make special provision for dealing with the native communities in their area; an early case of this nature was the appointment of Shepstone in 1845 as Diplomatic Agent to the native tribes in Natal, a post subsequently converted into that of Secretary of Native Affairs. The term acquired a new significance with the development in South Africa of laws applying only to natives, and designed to regulate their position in the economic life of the European community. In the Union the term 'native administration' applies in the main to the conduct of matters arising from laws of this type, and to the regulation of questions connected with native lands, and native affairs in the reserves. The term has the same significance in Southern Rhodesia, where, though the range of differential legislation applying to natives is more limited, the trend of policy follows that of the Union. In those British areas and mandated territories in which the policy of indirect rule has now taken a developed form, the term has a more extended meaning. Here it embraces not only the supervision by the executive of conditions arising from differential legislation, which in these areas is less important than in southern Africa, but the operation of a system under which traditional authorities are entrusted with the discharge of a wide range of executive and judicial functions. It covers, therefore, a considerable field of administrative activity, varying in its character with the type of policy followed in regard to native affairs. While it is not possible to classify rigidly territories according to their native policies, they can be discussed under a grouping which will provide some means

of distinguishing the main characteristics of the systems followed. The Union, Southern Rhodesia, and Kenya have points in common which bring them for this purpose into one group; we shall deal in the next place with the High Commission territories, then the British areas in which the system of indirect rule exists in a developed form. Uganda, the Gold Coast, and Sierra Leone must be separately examined, and the French and Belgian systems.

II. SOUTH AFRICA

(a) *General Review*

The present-day policy of the Union in native affairs must be viewed in the light of the historical circumstances in which it originated. The Hottentot population was regarded from the beginning of the nineteenth century largely as a source of labour which would replace the supply withdrawn by the termination of the slave trade; a few tribes retained their tribal organizations for a time, but the Hottentots were gradually absorbed as wage-earners into the economy created by the expansion of European farming and retained neither a separate territory nor a distinct existence as a community; they could, therefore, subject to regulation of their position as labourers, be brought within the general scope of the administrative and judicial system applicable to Europeans. The Bantu, however, presented a different problem, not merely by reason of their number, but on account of the conditions under which they were brought into the framework of European society. At first a military menace, they were regarded as invaders against whom the colony must be defended, and many of the tribes did not come under European control until after the opening of the diamond and gold mines. The bulk of the 'Kaffirs' and Zulus were ultimately assigned land in reserves and locations,¹ where to some extent they retained their tribal organization, but even if circumstances had made it possible to establish there a system of purely native rule, this would not have solved the problems created by their entry as wage-earners into European agriculture and industry. The conduct of native affairs accordingly assumed a double aspect; first, the determination of the native's

¹ For the history of the reserve policy see Chap. XII, pp. 803-14.

position at the points where he entered into the economic life of the European community, and secondly, the supervision of tribal life in the areas assigned to him for permanent occupation. In the exercise of the first of these functions and in the enactment of the differential legislation which it involved, the dominant consideration was the needs of European economy; in the exercise of the second function, policy was influenced at the outset by views which tended to regard African institutions as incompatible with the recognition of natives as members of a civilized state, however subordinate a position they might occupy. In the absence of formulated theories of differential treatment, social progress seemed to demand that their customs and habit of life should be assimilated to those of civilized societies; on economic grounds, the maintenance of tribal institutions appeared to prevent the growth of incentives which would make them readily available as wage-earners. These considerations determined policy in what may be described as the early and middle periods of South African history.

At a later stage policy came under the influence of the theory of racial segregation. Hitherto attention had concentrated on the problems presented by the native as a factor in the economic life of the European community; the theory of racial segregation was further concerned with the position which he was to be assigned in its social and political life. The policy assumes that natives will be confined as before to the ranks of 'unskilled' labour in industry or of workers on the farms; they will not be allowed to practise within the sphere of the European social organization any of the professions which may bring them into competition with the European, nor will they be allowed any such political rights as will give them a direct share in the government of the country. On the other hand, no legal restriction will be placed on their capacity to improve their social or material conditions in the reserves or other lands assigned to them; the Prime Minister has said that one object of the Natives Bills of 1926 was to enable natives to exercise a measure of self-rule in their own areas;¹ and the latest development of policy makes a departure from previous practice in recog-

¹ Quoted by M. Perham in *The Protectorates of South Africa*, 1935, p. 112: see above, Chapter VI, p. 154.

nizing that more liberal assistance must be given to prevent a deterioration of their condition in the sphere which is regarded as appropriate to them.

The differential legislation which regulates the position of the native in his relations with the European community covers practically every aspect of social and economic life.¹ Its operation in the spheres of political representation, rights to land, the regulation of labour, and state-aided education, is discussed in other chapters.² The conditions of residence of natives in urban areas are strictly regulated by 'pass' laws and similar restrictions,³ and recent legislation provides that native urban populations may be limited to estimated labour requirements. In the field of justice the position is not easy to summarize; but it may be said generally that in criminal matters the native comes before the ordinary courts and is subject to European law, while civil cases between native and native, save in certain areas, may, where they involve questions of native custom, be determined according to native customary law.⁴

In dealing with the system followed in the organization of the native areas it will be necessary to give some account of the development in each province, up to the period when the Union laid the basis for a uniform policy in the Native Affairs Act of 1920, and the Native Administration Act of 1927.

(b) *Cape Province*

In the Cape Colony earlier policy in British Kaffraria, subsequently known as the Ciskei, was dominated by the desire to avoid direct relations with native tribes, and to control them through treaties with their chiefs.⁵ The feasibility of this policy and the attitude taken towards it in the Glenelg dispatch of 1835 have been much debated; in any case, the prospect of organizing any such system came to an end with the formal renunciation by Sir Harry Smith of the treaty policy in 1847. Henceforth the

¹ For a list of post-Union legislation, see E. H. Brookes, *The Colour Problems of South Africa*, 1934, p. 202.

² See Chap. VI, pp. 149-55; Chap. XI, pp. 664-72; Chap. XII, pp. 803-14; Chap. XVIII, p. 1219.

³ See below, pp. 499-510.

⁴ For further details, see p. 509 below, and Chap. VII, pp. 281-3.

⁵ See E. H. Brookes, *The History of Native Policy in South Africa*, 1927, p. 13.

Ciskei came progressively under what may best be described as 'magisterial' rule. In 1848 the chiefs were allowed the 'reasonable exercise of their authority' under the supervision of the magistrate; after the war of 1850 full authority was restored to them, the magistrate acting as political agent; but in 1855, though still allowed to hear cases, they were 'assisted' by the magistrates in doing so, and received an annual stipend in place of the revenues which they formerly enjoyed from fines and confiscations. The inevitable sequel followed; the magistrates were given sole authority to decide cases, and the chiefs were reduced to the position of assessors; as they lost their judicial authority, administrative control also passed into the hands of the magistrates, a process which signalled the disappearance of the chief as the recognized authority over the tribe.

At no time was formal recognition given in the Ciskei to native customary law. In 1835, it is true, resident agents between the Keiskama and Great Kei rivers were ordered to take into their courts only cases of treason, murder, rape, witchcraft, theft, or arson, leaving minor offences and civil cases to be disposed of by chiefs, and these limitations upon the jurisdiction of the chiefs were removed in the following year. When after the war of 1850 the Grey system, under which magistrates heard cases jointly with chiefs, was applied to Kaffraria, the colonial courts were ordered to decide cases according to equity and good conscience, deviating from native precedent only as much as might be necessary to attain this end. But after Kaffraria was incorporated in the Cape in 1865, colonial law was in theory applied throughout, and no mention was made of native law except for specified matters, such as intestate succession. The practice of the previous régime, however, forced the magistrates to admit expedients such as the establishment of an extra-legal court at King William's Town, which settled disputes under native law on the understanding that the parties would submit to its decision.¹ In some locations and villages, headmen dealt with petty cases without any authority to enforce their decision; elsewhere all cases went to the magistrate. The consequence was an embarrassing uncertainty as to the law applicable to any given case; the prevailing practice was that in

¹ H. Rogers, *Native Administration in the Union of South Africa*, 1933, p. 220.

purely native matters native law should prevail; but if native law clashed with colonial law, the latter applied.¹ 'Bride-price' (*lobolo*)² contracts were not recognized by colonial law, but some magistrates admitted them, while others refused. If this system may be said to have shown an undue disregard of the institutions by which native life was regulated, it must be remembered that it was associated also with the Cape political theory of 'equal rights for all men' which received its most notable expression in ordinance 50 of 1828³ and manifested itself, when the Cape received its first elected parliament in 1853, in the grant of franchise rights to non-Europeans. When British Bechuanaland was annexed in 1884, lack of administrative personnel, and the experience that had been gained in the Transkeian Territories indicated a different policy. By Proclamation no. 2 of 1885 the operation of native law was recognized; chiefs were given exclusive jurisdiction in civil cases between members of their own tribes and allowed to retain criminal jurisdiction except as regards certain serious crimes; it may be noted that these powers were preserved to them by the Native Administration Act of 1927.

The Transkeian Territories have had a different history. From the first they were viewed as a purely native area; and early records contain frequent references to the difficulty of confining in them the tribes whose presence in the colony was embarrassing. The process of annexation began with the proclamations relating to Fingoland and Griqualand East in 1879, and was completed by the incorporation of Pondoland in 1894. The various annexation laws recognized that the natives were 'not sufficiently advanced in civilization and social progress to be admitted to the full responsibility granted and imposed respectively by the ordinary laws of the Colony'; while, therefore, magisterial rule was extended to them, and, as in the Ciskei, the chiefs were reduced to the position of stipendiaries, native law was administered. This procedure was facilitated by the fact that legislation was by proclamation, which both made it possible to recognize native law, and to adjust its terms when necessary to the needs of the new conditions which had arisen. Whereas colonial laws operated in the Ciskei unless

¹ E. H. Brookes, *op. cit.*, 1927, p. 96; *The Cambridge History of the British Empire*, vol. viii, 1936, p. 825. ² See Chap. II, p. 41, note 3. ³ See Chap. VI, p. 150.

specially reserved, they applied to the Transkei only when extended by Parliament or by proclamation. The recognition of native law was provided for in the general regulations promulgated on the annexation of each territory, but it was not until the Cape Native Laws and Customs Commission of 1883 had made its important contribution to the study of the subject that a uniform system was adopted. The colonial criminal law was introduced in the form of the Transkeian Penal Code, Act 24 of 1886, designed as suitable to natives, but made applicable also to the few Europeans resident in the territories. This code introduced a few modifications in the colonial law of procedure, and adopted one principle of native law, that of communal responsibility in cases of stock theft, under a provision known as the 'spoor law', but without the safeguards customary in the tribe;¹ it also contained sections dealing with witchcraft. Native civil law was recognized in the magisterial courts, but no attempt was made either then or at any subsequent date to codify it.

The commission did not, however, stop at the regularization of the legal position; it recognized the need for local self-government, and recommended the institution of an informally elected native council. An example of a native area with its own revenues had existed since the Fingo District of Victoria East, annexed in 1846, had been surveyed in individual holdings, the rents from which were administered by the magistrate in charge in the interests of the community, though without consulting the opinion of the natives; also in 1882 a Fingoland District Fund was established, administered by a committee of magistrates and native headmen, into which Fingo men paid a voluntary levy of 2s. 6d. per annum, and proceeds amounting to about £800 annually were used to maintain a hospital and for public works.² From 1881 onwards Sauer, as Minister of Native Affairs, made it a practice to hold public meetings of natives for the discussion of matters affecting them, and Captain Matthew Blyth, the first chief magistrate of the Transkei, recommended in 1882 that 'a sort of Municipal Council be formed in each District'; in his

¹ *Cambridge History*, op. cit., p. 306.

² F. Brownlee, 'Administration of the Transkeian Native Territories', *Journal of the Royal African Society*, vol. xxxv, no. cxliv, 1937, pp. 39-49.

evidence before the 1883 commission Sir T. Shepstone suggested a council of chiefs. The recommendation of the commission did not bear fruit for some years; and meanwhile the parliamentary franchise was extended to the Transkei by Act 30 of 1887.

The Glen Grey Act of 1894, introduced by Rhodes, referred specifically to a Ciskei district, but its importance in the history of native administration is due mainly to its subsequent application to the Transkeian Territories. In principle it gave effect to the recommendations of the 1883 commission regarding the institution of a council, though it took a different form from that then contemplated. It had a dual aspect: the introduction of an individual form of land tenure, and the initiation of a practical system of local government in native areas. The first of these aspects will be separately described in the chapter dealing with land problems;¹ the second merits detailed treatment here. The Act contained at the outset the germ of the theory of political, as a corollary to territorial segregation, in that the holding of land in quit-rent tenure in districts to which it applied did not constitute a qualification for the parliamentary franchise. Rhodes described it as 'a Native Bill for Africa', and its principles regarding local government by means of a council were progressively extended by proclamation.

The Act provided for the creation of two separate types of local authority—subsidiary bodies known as location boards for the control of individual locations, and a higher body, the district council, responsible for the administration of local affairs in the district as a whole. The location boards came into existence only in Glen Grey; in the Transkei the district council was from the first the only form adopted. The Transkeian Proclamation 352 of 1894 established four district councils, each of which sent representatives to a General Council or Bunga constituted in the following year. By 1903 councils were established in thirteen districts, which sent their representatives to the Transkeian General Council;² by 1925 district councils had been constituted in each of the Transkeian districts, excepting Eastern Pondoland, and Mount

¹ See Chap. XII, pp. 843-5. See also Chap. XI, p. 638, for relation to the labour situation.

² Proclamation 152 of 1903.

Currie, which is predominantly European. In 1911 a General Council was established for the three districts of Western Pondoland, and in 1927 the four districts of Eastern Pondoland were also included in this council.¹ The two General Councils were federated in 1931 under the name of the United Transkeian Territories General Council.² Under the law now in force, each district council contains two members appointed by the government and four who represent native opinion. The method of selecting the four native representatives varies. In the Transkei they are nominated from among themselves by twelve persons elected by landowners and local taxpayers; in Pondoland two are chosen in this way, the other two being nominated by the paramount chiefs of Eastern and Western Pondoland. A further concession to native tradition has been made in the recognition of these two chiefs and the chief of Tembuland to act as additional members of the councils in whose districts they reside. The appointment of all native representatives is subject to the approval of the Governor-General.

In essence the council system, while providing for a measure of local government, was an extension of the system of magisterial rule; the district magistrate is chairman *ex officio* of the district council, the Chief Magistrate is chairman and chief executive officer of the General Council. This council consists of the chairman, the magistrates of the districts in which there are district councils, and three members of each district council. One of these members is nominated by government; in the Transkei the other two are nominated by the councils themselves for appointment by the Governor-General; in Pondoland each council nominates one and the chiefs nominate one. The chiefs of Eastern and Western Pondoland and Tembuland are *ex officio* members of the General Council. The district councils meet six times a year; the General Council annually. The function of the latter was originally confined to discussing and expressing an opinion on matters affecting the local native population; but in 1932 its constitution was revised³ and its powers were extended to include the consideration of any proposed legislation and the initiation of any

¹ Proclamations 169 of 1911 and 166 of 1927.

² Proclamation 279 of 1930.

³ Proclamation 191 of 1932.

matter relating to the condition of the native population of the Union, in so far as these affect the natives of the Transkei, and the consideration of any specific matter submitted to the council by the government. At the close of its meetings its resolutions are reviewed by a conference of the official members before submission to the Governor-General. This conference was at one time viewed with some suspicion by native opinion, but since the native members of the council have been allowed to be present at its discussions, suspicion has abated and less interest appears to be taken in its proceedings.

The revised constitution of 1932 contained another important innovation. Hitherto the competence of the General Council had been limited to offering advice to the Chief Magistrate as chief executive officer; the new constitution created a standing Executive Committee consisting of the Chief Magistrate with three other magistrates and four native members nominated by the council, to be responsible for the appointment and dismissal of staff, the establishment of agricultural institutions, the consideration of tenders for public works, and the institution of legal proceedings. Questions arising in the Executive Committee are decided by a majority of votes, but the chairman has the right to reserve for the decision of the Minister any resolution that is contrary to his own views.

The councils originally derived their revenues from an annual rate of 10s. upon adult males and upon women who occupied a separate hut or piece of land; but subsequently the Natives Taxation and Development Act of 1925¹ allocated to them the rents payable for land held on quit-rent, together with the proceeds of a local tax of 10s. levied in respect of every hut or dwelling in a native location occupied by a person who is not a quit-rent payer. These revenues are collected by government and handed over to the Treasurer of the General Council, a European official appointed by government. The position of the district councils is that of executive organs to the General Council; they have no separate revenues, but as far as possible the General Council distributes funds to them in proportion to revenues received from each district. Generally speaking, the district councils initiate

¹ See Chap. X, p. 554.

proposals for expenditure, which are collated and laid before the General Council in the form of estimates. The estimates as passed by the Council and the official conference require the approval of the Governor-General before they can be acted upon. The General Council is responsible for an annual expenditure of approximately £200,000; its total expenditure since its inception up to June 1935 amounted to £3,834,070. It has established three agricultural schools, a sheep farm, and three small experimental farms;¹ it employs ninety-seven agricultural demonstrators trained at the council schools, and it is responsible for the maintenance of some 4,400 miles of road. It makes a *pro rata* contribution to the cost of treating its ratepayers in state-aided and mission hospitals. Considerable sums have been spent on measures to combat soil erosion and on the conservation and supply of domestic water; the fencing of arable land is assisted by pound-for-pound grants.²

It remains to complete the account of developments in the Ciskei. The first local self-governing bodies for natives were village management boards, set up under the Village Management Act of 1881, which applied to natives and Europeans alike. These boards were not under European supervision, and proved a failure. The Glen Grey Act of 1894 provided in the first instance for a location board in each location, to consist of three persons appointed by the Governor after consultation with the local resident landholders. Its functions, as subsequently defined in Government Notice 936 of 1919, were confined to such matters as the care of water-courses, control of grass-burning, and the regulation of stock-grazing. These boards do not appear to have functioned regularly or with great effect; their value has been described as providing a useful mouthpiece for the people, and a source of advice to the magistrate in land administration. The Glen Grey District Council provided for by the Act was established in 1895; it consists of twelve members, six appointed by the government and six nominated by the location boards for appointment by the Governor-General. The boards were made subordinate to the council by the Glen Grey Amendment Act of 1905. It was not

¹ See Chap. XVIII, p. 1222.

² For comments on the working of the Council, see below, pp. 372-3, and pp. 330-2.

until after the passing of the Native Affairs Act of 1920 that the council system was further extended in the Ciskei. This Act provided for the institution of local councils for the whole or part of a declared native area. It permitted of either elective or appointed membership and gave a wide range of local powers, including the right to levy a rate, and responsibility for the provision of medical and educational facilities. Difficulties were found in the institution of councils owing to the different stages of development at which the communities affected had arrived. An amending Act of 1926¹ provided that where necessary the exercise by a council of its powers might be made subject to the approval of the Minister. By 1932 eight local councils with full powers had been established for native areas in the Ciskei, including Glen Grey, and in 1934 they were federated in the Ciskeian General Council.² The functions of this council are similar to those of the Transkeian General Council; but the district councils are on a federal instead of a union basis, and the revenues, which are now derived, as in the Transkei, mainly from quit-rents and the 10s. local tax imposed by the Natives Taxation and Development Act of 1925, are paid direct to each subordinate council and expended according to estimates approved by the Governor-General. The funds of the General Council are derived mainly from a percentage contribution from the subordinate councils, the standard rate being 12½ per cent.; in 1936 its expenditure amounted only to £4,101. The resources of the local councils vary; the largest, that of Glen Grey, spends an average of about £9,000 annually.

(c) *Natal*

The native policy of Natal was dictated by circumstances rather than by choice. The Blood River battle of 1838 appeared to have given a white population of 6,000 the control over 25,000 natives, and the first proposal of the Volksraad was to limit the native population in the European area to the number required for labour; no farmer was to keep more than five native families on his farm,³ and the surplus was to be moved to a tract between the

¹ Native Affairs Act, 1920; Amendment Act 27 of 1926.

² Proclamation 34 of 1934.

³ E. H. Brookes, *op. cit.*, 1927, p. 24.

Umtamvuma and Umzimbuvu rivers. But natives, anxious to return to their ancestral homes, continued to pour in from Zululand, and by 1845 it was found that the government had 100,000 to deal with. Wholesale removal was clearly impossible, and the Natal Native Commission of 1846-7 recommended that the refugees should be placed in 'locations',¹ an operation which Shepstone was able to complete without resistance. Of the hordes of natives for whom provision had now to be made, more than two-thirds were, as the result of Zulu rule, without chiefs or tribal organization. Shepstone himself favoured the policy of direct management through a superintendent in charge of each location; but the government was unable to find funds for the appointment of the superintendents, and Shepstone's only resource was to attempt the re-creation of the tribal system. In some cases he was able to gather the scattered members of tribes together under a scion of the old 'royal house'; in others, newly appointed chiefs had to be given jurisdiction. He succeeded in overcoming the Cape influence which would have made the native subject to Roman-Dutch law, and the Ordinance 3 of 1849 formally recognized native customary law, 'so far as it was not repugnant to the general principles of humanity observed throughout the civilized world'. It is noticeable that magistrates were at a later date officially styled 'Administrators of Native Law'. The chiefs were appointed officers of government and exercised judicial powers, though the extent of their jurisdiction was not defined and they were subject to the general control of the magistrates. In 1850 the Lieutenant-Governor of Natal was proclaimed supreme chief of the native population, a measure intended at the time to mark the replacement of the Zulu monarch; as supreme chief he had full authority to remove or appoint chiefs and in all court cases was the final appellate authority.

Shepstone's policy achieved its ends slowly and in spite of many obstacles. The Natal Commission of 1852-3² found that the locations were so large as to 'dry up the source whereby an abundant and continuous supply of Kaffir labour for wages might have been procured'; and stated its view that civilization could make no

¹ For the reserve policy in Natal, see Chap. XII, p. 719.

² *Report*, p. 4.

progress save under the direct rule of magistrates appointed for each location. The real obstacle in Shepstone's way, however, lay in the lack of resources for improvement of the locations. History has generally agreed that his system controlled the natives, but did little to advance their welfare; Merriman, the Cape statesman, speaking before the Native Affairs Commission of 1903-5,¹ charged Natal with not having elevated nor educated its natives: 'they are barbarians, and you have designedly left them in a state of barbarism'. But if this is in some measure true, it was due, so far as Shepstone was concerned, largely to the lack of funds for providing any improvement. He was opposed to the europeanization of the native people; but he recognized that the procedure of customary law was not universally applicable, and made provision for the more advanced native by a system of exemptions;² the limitations on the grant of the franchise to natives have been described.³ Exemption also was not easy to obtain, and was granted to a very small number; it was not popular among natives, since the actual privileges secured were negligible.

Shepstone's patriarchal administration of native affairs in Natal practically came to an end in 1875, and was followed by a period of transition lasting until 1893, in which some important aspects of his policy were modified. In Zululand, which had remained outside the Natal system, the war of 1879 resulted in the final destruction of the Zulu military power; the paramount Cetewayo was banished, and thirteen independent territories, each under its own chief, were created. A Resident was appointed, but no effective powers were given to him, and in the absence of central control disorder developed which led to the restoration of Cetewayo in 1882, and, after he had been put to flight by his rivals, to the annexation of Zululand to the Crown in 1887. In 1897 it became part of Natal, and was brought under the system of native administration of Natal; there had been in some quarters a serious fear of the consequences of leaving so large a Bantu population under the almost unrestricted power of its chiefs.

In 1875 a Board was appointed to codify the Bantu customary

¹ *Evidence*, vol. ii, p. 398.

² Law 11 of 1864, replaced by Law 28 of 1865.

³ See Chap. VI, p. 150.

law; crimes by natives were to be tried before the ordinary courts; chiefs and the administrators of native law were given power to decide civil disputes between natives; a Native High Court was instituted for hearing appeals from the courts of the administrators, and for trying certain crimes excluded from the jurisdiction of the ordinary courts, such as faction fights. Appeals from the Native High Court were to lie to a Court of Appeal, a branch of the Supreme Court, consisting of the Secretary of Native Affairs and Judges of the Supreme and Native High Court, instead of to the Lieutenant-Governor.¹ This separation of judicial and executive authority was criticized as representing a departure from the native system, though it must be noted that the magistrates continued to combine both functions; and the reference to the Supreme Court was significant, in that it brought the Natal native for the first time under an alien system of law. The first Natal code promulgated in 1878 was only a guide to Bantu customary law and was not binding on the courts; but Law 44 of 1887 prepared the way for a statutory native code having legal force, which was passed through the legislature as Law 19 of 1891. It had the grave defect that its only provision for revision was by way of amendment by Parliament, a procedure which incurred the justifiable criticism of the Natal Native Affairs Commission of 1906-7. The code, while maintaining to the chiefs their civil jurisdiction in all cases except divorce, allowed them no criminal powers, but they were made responsible for the maintenance of order and the apprehension of criminals.²

The period from 1893 up to the native rising of 1906 was marked by an increasing departure from the system which Shepstone had introduced. A government memorandum of 1908³ claimed that in Natal 'tribal organization has been used as a vehicle of administration. . . . By this system all the efficient machinery of the native form of government was brought into play, adapted and made available.' But the forces against the development of a system of what would now be described as indirect rule were strong; the chiefs were allowed only subordinate judicial powers; magistrates, taken from the Department of Justice, grew increas-

¹ Law 26 of 1875.

² Natal Native Code, 1891. See Chap. VII, p. 269.

³ Natal Government Notice 39 of Jan. 20, 1908.

ingly out of touch with native affairs, and though the reserves were protected by the creation of the Native Land Trust,¹ little was done to improve their condition, and no remedy was found for the growing disintegration of native tribal life and institutions. The commission of 1906-7 made detailed recommendations for administrative adjustments, including the appointment of Native Commissioners as purely executive officers, but it made no proposals which would involve a change in a system that now seemed to halt between two different theories of native development.

It was not to be expected that the passing of the Native Affairs Act of 1920 would lead to an extension of the council system in Natal; in fact, only one local council, that of Msinga, has been constituted, and the exercise of its powers is subject to the approval of the Minister, as provided for in the Act 27 of 1926.² On the other hand, no marked advance has been made in strengthening the authority of chiefs, or reconstructing tribal organization. The remarks of the Native Economic Commission of 1930-2,³ emphasizing the value of native institutions as providing a deep-rooted stock on which advanced ideas can be most fruitfully grafted, would seem to be specially relevant to Natal. The commission expressed in particular the opinion that it is better to administer law through native than through European tribunals, and proposed as a first step the extension to chiefs of greater powers in trying criminal cases. Eighty chiefs in Zululand retain the powers of civil and criminal jurisdiction which were given when Zululand was annexed; in the rest of Natal 222 chiefs, acting chiefs, and headmen retain their limited powers of civil jurisdiction, and it is now proposed to extend a measure of criminal jurisdiction to them. The terms of the Native Administration Act of 1927 provide for a more logical practice in regard to the recognition of native customary law. The difficulty previously noticed regarding the revision of the Natal Code of Native Law has been removed by section 24, which permits of its revision by proclamation; a revised code has been promulgated and extended to Zululand.⁴

(d) The Transvaal

Native affairs in the Transvaal require less detailed treatment. The early attitude towards native questions has been well described as having been 'derived directly from the order of things which Ordinance 50 of 1828 and the abolition of the commando system in 1833 had destroyed in the Cape'.¹ In the absence of control by an organized central government, native affairs were treated by local authorities as a purely military problem, with the result that the tribes, either expelled from their lands or settled under farmer control, were broken up and disorganized. The early Transvaal farmers claimed that all natives within the limits of the republic were their subjects, liable to taxation and commando service. The course taken in regard to the land is described elsewhere.² At the outset only Roman-Dutch law was recognized and administered by magistrates; the chiefs were given no jurisdiction, though they continued to regulate disputes between tribesmen, and native cases seldom came before the Landdrost.

After the annexation of 1877 the British government set up a special Department of Native Affairs; this was retained after the retrocession, and its existence sensibly affected subsequent native policy. In a memorandum³ issued by the department in 1879, which seemed to be inspired by Natal influences, it was stated that experience had shown that the government of the native could not be carried on under the ordinary law of the country, and shortly before retrocession an Ordinance, no. 11 of 1881, was issued creating the Administrator supreme chief, and all the Landdrosts administrators of native law, and formally recognizing native law in civil matters in the courts of the Transvaal. This ordinance was shortly afterwards repudiated by the government of the restored South African Republic, but many of its provisions were subsequently embodied in Law 4 of 1885. It is noticeable that this law did not set up a Native High Court, but left the right of appeal and review with the President as paramount chief, and a new system was initiated by the appointment of native com-

¹ *Cambridge History*, op. cit., p. 398.

² See Chap. XII, p. 720.

³ Quoted by E. H. Brookes, op. cit., 1927, p. 125.

missioners, distinct from the magistrates, with executive and judicial powers. In spite, however, of the terms of the 1885 law, the Supreme Court never relinquished jurisdiction in civil cases, and the effect of the recognition of native law was undermined by the use which it made of the repugnancy clause; it refused, for instance, to acknowledge the legality of native customary marriages, and Law 3 of 1897, by recognizing only Christian and civil marriages, led to the non-recognition of *lobolo* marriages by the courts.¹ The Law of 1885 provided for the grant to chiefs appointed by government of petty civil jurisdiction within their own tribes, though they were given no power of execution. The general features of this system remained in force after the annexation of 1900; but by Act 29 of 1907 the power of reviewing the decisions of native commissioners, formerly vested in the Governor and Commissioner of Native Affairs, was withdrawn, and the appeal was vested in the Supreme Court of the province. With the passing of the Native Affairs Act of 1920 an experiment was made in the institution of local councils, and five such councils have been set up; with the exception of one case in which full powers have been granted, they exercise the restricted powers for which provision was made by Act 27 of 1926. Recent policy has tended towards a greater use of the chiefs in judicial matters. Their powers, as in Natal, are regulated by the Native Administration Act of 1927, which also, in recognizing the validity of marriages contracted in accordance with native custom, redresses the inequity caused by the former Transvaal law.

(e) *The Orange Free State*

In the Orange Free State the native population in the reserves was never large; to-day, in spite of immigration, it is still far lower in proportion to Europeans than in any other province of the Union. The Free State had at one time a Department of Native Affairs, but it was abolished in 1908, when native administration was entrusted to the Colonial Secretary's Department; from the first it controlled its native population through the regular establishment of magistrates, and has only posted special officers to the reserves at Thaba 'Nchu and Witzieshoek.² At the outset it gave

¹ See Chap. VII, p. 268.

² See Chap. XII, p. 720.

no general recognition to native law, but by a special enactment¹ acknowledged the legality of native marriages in the Thaba 'Nchu reserve; elsewhere they received no recognition until the passing of Law 26 of 1899, which provided that the children of such marriages were to be regarded as legitimate for purposes of inheritance, and established the paternal power of the father; a system of intestate succession, derived from Roman-Dutch law, and repugnant to Bantu conceptions, was introduced, but not operated, outside the Thaba 'Nchu reserve. As in the rest of the Union, that situation has been remedied by the provisions of the Native Administration Act of 1927. The chiefs in the reserves were at first given no judicial powers; two have now civil and criminal, and one civil jurisdiction only, under the Native Administration Act. At an earlier stage a Native Reserve Board was created in each of the three reserves under Ordinance no. 6 of 1907; there are now four such boards. The members are nominated, and sit under the chairmanship of the magistrate; they draw their revenues from the local tax imposed by the Natives Taxation and Development Act. Their functions are wider than those of the Location Boards in the Cape, constituted under the Glen Grey Act of 1894.²

(f) *Native Affairs under the Union*

The South Africa Act of 1909³ laid down that the control and administration of native affairs should vest in the Governor-General in Council, who should exercise all special powers in regard to native administration previously vested in the governors of the several colonies, or exercised by them as supreme chiefs. From the first, native affairs had been reserved in greater or less measure from the field of ordinary legislation. When the various territories of the Transkei were annexed to the Cape Province, the Annexation Acts conferred on the Governor an unrestricted power of legislation by proclamation, and provided that no Act of the legislature should apply unless it contained a special provision to this effect or was extended to the area by the Governor's

¹ *Wetboek van die Oranje Vrijstaat*, Hoofdstuk, iv, i.

² See above, p. 355.

³ Section 147.

proclamation: this power was reaffirmed in respect of all the Transkeian territories by the Cape Act of 1897. The Governor was declared supreme chief in Natal in 1850,¹ and under the Natal Code of Native Law exercised wide authority in regard to the appointment of chiefs and the issue of executive orders through them. The Transvaal Law 4 of 1885 constituted the President paramount chief of the native population, with the full authority vested by native custom in a paramount chief; and the Act also gave him a general power to frame regulations for the better working of the law. After annexation these powers passed to the Governor, and the Letters Patent issued upon the grant of responsible government in the Orange River Colony in 1907 conferred a similar authority on the Governor of that colony. On the establishment of the Union, the Native Affairs Department was entrusted with all the matters hitherto vested in the Native Affairs Departments of the colonies, and became the executive authority for the purpose of powers transferred to the Governor-General in Council by section 147 of the Union Act.

The authority acquired by the Native Affairs Department thus depended partly on statutes, placing administrative functions in the hands of the government, and partly on the powers which it derived as successor to the governors in their position of supreme or paramount chiefs. These latter powers, however, were vague and undefined, save in Natal, where they were embodied in the Natal Code of Native Law; elsewhere, they were based on an interpretation of Bantu customary law, which, if in many ways convenient, was, as has often been claimed, of questionable validity.² They could not in any case be logically exercised in the same manner over natives living in tribal conditions, and those who had become more or less permanently resident in European areas; and they could have little real foundation in the Ciskei, where the tribal organization had as a matter of policy been broken up. The executive authority of the Union Native Affairs Department, therefore, where it was not derived from specific enactment, stood on an indefinite basis for some years, and the need of a clearer legal definition was pointed out by the courts.

¹ See above, p. 357.

² See, for instance, E. H. Brookes, *op. cit.*, 1934, p. 107.

The first step taken, however, was not in this direction, but in the establishment of a body to advise in native affairs and to consult with the natives themselves. Act 23 of 1920, which provided for the general extension of the council system inaugurated by the Glen Grey Act of 1894,¹ also constituted a permanent Native Affairs Commission under the chairmanship of the Minister of Native Affairs. It was to have not less than three nor more than five other members.

The Native Affairs Commission was given a consultative and advisory position in regard to the general conduct of native affairs or to legislation affecting natives; if the Minister did not accept its advice, the Commission might require that its views be submitted to the Governor-General; if the latter did not accept its recommendations, it might require that the papers should be laid before the Houses of Parliament. In certain specified matters it was incumbent on the Minister to seek the Commission's advice, as in the establishment of local councils, the holding of native conferences to discuss proposed legislation, and the appropriation of moneys accruing to the Native Development Account.² The influence which a body of this character could exercise on native affairs depended largely on the character and independence of the members whom government nominated to serve on it. At the outset it had a certain effect on policy; in later years, partly owing to a cessation of activity while its members served on the Native Economic Commission, and partly to changes in its personnel, its influence declined. Its functions, however, have increased considerably since the passing of the Native Trust and Land Act of 1936, which requires that the Minister, in administering the affairs of the South African Native Trust Fund under delegation of authority from the Governor-General as trustee, must act in consultation with it.³ The value of its advice must largely depend, as before, on the calibre of its membership.

The provision made in the Act of 1920 for holding native conferences had its effect in the summoning in 1922 of a conference which it was originally intended should meet annually, and which did so for a few years. The measure was of value; but the attitude

¹ See above, pp. 352-6.

² See Chap. XVIII, p. 1213.

³ Native Trust and Land Act of 1936, sub-sect. 3 of sect. 4.

taken by the conference in regard to the native land and franchise Bills was viewed with disfavour, and after 1927 it was convened only once. Regional conferences were, however, held to discuss the terms of these Bills. The same necessity for the summoning of native conferences no longer exists, in view of the establishment of the Natives Representative Council under the Representation of Natives Act of 1936.¹

The Native Administration Act of 1927, which, as has been shown, made an important departure in its recognition of native customary law, was also designed to clarify the legal position of the executive government in its control of native affairs. Its first section vested in the Governor-General (that is to say, the officer administering the government of the Union, acting by and with the advice of the executive council)² the position of supreme chief of all the natives in Natal, Transvaal, and the Orange Free State; as supreme chief he could alter tribal boundaries, divide tribes or order their removal from one place to another. His further powers as supreme chief were defined as those held by him from time to time in respect of natives of Natal. It is important to note the legal effect of this provision. It did not confine the Governor-General to the powers then embodied in the Natal Code; section 24 empowered him to modify the code from time to time by proclamation. While, therefore, the provision had the advantage of basing the authority of the executive on written law instead of on an undefined usage, it at the same time gave to the Governor-General as supreme chief practically unfettered power of legislation by proclamation in regard to purely native matters in the three provinces. The Act further gave explicit powers to amend by proclamation any law then applicable to 'scheduled' native areas, and proclaim new laws in them (section 25); to issue regulations in a defined range of subjects (section 27); to create 'pass' areas and issue 'pass' regulations (section 28),³ and by executive action to restrain the dissemination of dangerous doctrines among natives, including the restriction of entry into native areas or removal from them (section 29). The only restriction on this edictal

¹ For Natives Representative Council, see Chap. VI, pp. 153-5.

² Interpretation of Laws Act, 5 of 1910.

³ For an account of the 'pass' system, see Chap. XI, pp. 664-72.

legislation lies in the provision embodied in section 26 that proclamations must be laid on the table of both Houses of Parliament, which can by resolutions passed in the same session move for their repeal.

The wide powers conferred on the executive to legislate by proclamation in regard to native affairs had their precedent in the powers of legislation vested in governors before the Union;¹ but their maintenance in more modern times has been much criticized. It is admitted that there are a number of administrative matters in which the executive must have, as it has elsewhere, a rule-making power; it has been argued, however, that in normal practice the limits of this power are clearly defined in the substantive law; it is not usual to extend the rule-making power to matters of policy, or to permit it to make restrictions on individual liberty or rights of property. On the other hand, similar powers are exercised by the executive in many of the British Crown colonies; even where legislation normally takes the form of law or ordinance passed by a legislative council, the Crown still retains the power to make laws in the form of an Order in Council.² Again, in the French colonies, legislation is entirely by ministerial decree, and the same is true of the Belgian Congo, save for a limited number of subjects.³ If, therefore, there is any anomaly in a system such as that created by the 1927 Act, it lies in the fact that the country at large is under a parliamentary régime, and that laws affecting the rights of Europeans are made by the normal process of legislation. It has, moreover, been claimed, not without some justice, that in the absence of a native franchise the position of the native is not materially affected by the placing of legislative powers in the hands of the executive. The use to which the measure has been put is perhaps a better criterion of its value than any theory of constitutional law. Proclamation 165 of 1932, which repealed the old Natal Code and substituted a new one, contains in its section 8 a provision for the summary arrest and detention of any native judged to be dangerous to the public peace; again, Proclamation 252 of 1928 prohibits the holding in any native area in the three northern provinces of

¹ See above, pp. 363-4.

² See Chap. VII, p. 272.

³ See Chap. VI, pp. 185, and 206.

gatherings of more than ten persons for other than religious or domestic purposes without the approval of the magistrate of the district. Both these provisions are of a type which would normally have been made the subject of substantive legislation; but with these exceptions, the use of proclamation does not seem to have gone beyond the scope commonly taken elsewhere by the rule-making powers of an executive government.¹

The Native Administration Act of 1927 had a further importance in its effect on the organization of the Native Affairs Department.² Hitherto district administration had been carried on by a variety of different agencies, magisterial and other. Section 2 of the Act may be regarded as having accorded statutory recognition to the principle that in predominantly native areas administrative functions should, as far as possible, be entrusted to native commissioners serving under the Native Affairs Department. In purely native areas such as the Transkeian territories, the executive authorities are officers of the Native Affairs Department, though they are also given magisterial powers by the Department of Justice. Within the last few years the Native Affairs Department has taken over fifteen predominantly native districts formerly held by officers of the Department of Justice. In districts with a large European population, which also contain a considerable number of natives, the chief local executive officer remains the magistrate under the Department of Justice, but he may be made a native commissioner, and in addition it is usual to appoint an official of the Native Affairs Department as additional or assistant native commissioner.³ Where there is any considerable European population the magistrate has little time for dealing with the reserves. Only where there are few natives is no appointment of any kind made from the Native Affairs Department. While this change constitutes a substantial advance, in that it allows for the appointment of a body of officers with special experience of native affairs, the position would be further improved if the Union were to provide a course of special training for officers entering the service of the Native Affairs Department. As is shown elsewhere,⁴ the in-

¹ For a list of the proclamations issued, see H. Rogers, *op. cit.*, pp. 26-9.

³ H. Rogers, *op. cit.*, pp. 12-13.

⁴ See Chap. II, p. 53.

ducement given to its officers to take the course of Bantu studies at the universities has now been withdrawn.

The unusually wide range of legislation applicable to natives in the Union gives the Native Affairs Department a correspondingly wide field of activity. The Native Labour Regulation Act of 1911 vested in it the supervision of the recruiting and employment of native labour, for which purpose it maintains a Director of Native Labour;¹ it administers the Natives (Urban Areas) Act of 1923,² and is responsible for the purchase and management of lands in 'released' areas under the Land Act, 1936;³ through its control of the Native Development Fund, from which native education is financed, it takes a part in native educational policy,⁴ and the increasing attention given to the improvement of conditions in the reserves has involved the addition to its establishment of agricultural and engineering sections functioning under an officer known as the Controller of Native Settlements.⁵ It thus discharges in regard to natives a number of functions which, in relation to Europeans, are carried out by separate departments of state.

The policy which has dictated the measures taken to regulate the position of natives in their contact with the European economy has the same historical background as that which applies to the organization of conditions in the native areas and in great measure reflects the same outlook, but it is possible to distinguish the tendencies shown in the more recent development of these two aspects of policy. It would be just to say that during the last decade the differential legislation applicable to natives has not only taken a wider scope but has assumed a more restrictive character. The influence of the 'civilized labour' policy⁶ and of the theory of segregation has made itself felt in legislation, of which the Native Service Contract Act of 1932 and the recent Native Laws Amendment Act, 1937,⁷ form the most significant examples, while the rigour with which regulations of the character of the pass laws or the Masters and Servants Acts are administered remains a characteristic feature of the administration. The political reactions of

⁴ See Chap. XVIII, pp. 1213-14.

⁶ See Chap. XI, pp. 682-92.

this policy have been seen in the passing of the Representation of Natives Act, with its restriction of the franchise formerly enjoyed by natives in the Cape.¹ It is true that there are few territories containing both European and native populations in which some discriminatory legislation has not been found necessary, but South Africa has perhaps made the greatest use of this type of law.

The Union may, indeed, be said to occupy the position at one end of the scale which British India occupies at the other. In the latter, the only legislation which can be described as differential is that which gives to Europeans, as also to Moslems and Sikhs, the right to exercise a communal vote, and secures to Europeans and Indians certain privileges in the trial of criminal cases in which they are respectively concerned. With these exceptions, it would be difficult to find any instance of discrimination; the existence of a legal provision securing to each group in the community the right of maintaining its personal law of marriage or succession does not, of course, come within this description. But the comparison serves to illustrate the difference alike of circumstance and policy which has produced the special legislation of South Africa. The problem of the Union is, indeed, almost unique: it is that of integrating into one social organization 2,000,000 Europeans and 6,000,000 Africans. In view of the disparity in the social standards and economic development of the European and the Bantu, at the stage at which the latter now stands, some measure of differential treatment would appear to be inevitable; it is the far-reaching range of the legislation now in force, its unusually restrictive character, and the operation of the machinery of pass laws or regulations affecting personal liberty which it employs, that have attracted attention and invited criticism. Considerations of equity and the standards of good administration may produce modifications of the system, but factors of a more fundamental nature must decide its ultimate fate. Economic developments will in the end determine whether the Union can maintain the restrictions which confine so large a part of its available labour to unskilled employment. Again, should there be a considerable increase in the number of natives who attain a high standard of education, despite the disabilities imposed upon them, the Union may find it difficult

¹ See Chap. VI, pp. 152-5.

to justify to itself the maintenance of a classification which rigidly separates the European and native population, and prohibits the entry of Africans into the European legal and social system.

There has, however, been a partial change in that aspect of native policy which relates to the native areas. The formal recognition given to native customary law, the extension of the system under which the local administration is vested in officers of the Native Affairs Department, the repurchase of large areas for native occupation contemplated by the Land Act of 1936, the provision for agricultural and other improvements in the reserves, to which the government now appears to be committed,¹ the extension of medical facilities implied in proposals made for a course for medical aids,² may be quoted as evidence that greater attention is now being paid to the needs of the native areas. Practical expression in the form of a considerable amount of legislation, financial aid, and departmental activity has been given to the realization, which is now widespread throughout the Union, that standards of health, education, agriculture, and living conditions generally in these areas must be steadily improved, and ample lands suitable for economic development must be provided for the use of natives if the drift to the towns is to be checked with any degree of success, a regular supply of labour maintained, and discontent avoided. In regard to internal political development, policy is definitely directed to the extension of local government institutions through the council system. One passage of the report of the Native Economic Commission³ might, it is true, seem to advocate a policy of reconstructing the traditional institutions based on the authority of the chiefs, and, as has already been shown,⁴ some steps have since been taken to extend their judicial powers. The administrative functions of chiefs and headmen, as defined by regulations⁵ issued under the Native Administration Act of 1927, do not go beyond the prevention and detection of crime, the giving of assistance in connexion with the registration of taxpayers and the collection of taxes, the supply of labour, the administration of laws relating to the allotment of lands and kraal sites, and the dispersal of unlawful assemblies. If, then, there is any

⁵ Government Notice 2251 of 1928.

tendency to recognize the traditional position of chiefs, it exists mainly in the judicial field, and it does not seem that there is any intention of granting wider administrative authority on the lines adopted in areas where the system of indirect rule prevails. South African opinion has never declared itself clearly in favour of this principle; it holds to the policy of developing local self-government through the council system, and it has been encouraged in this view by the success which is considered to have been achieved by the General Council in the Transkeian Territories. It is of importance, therefore, to attempt some estimate of the position attained by it; elsewhere, as has been shown,¹ the councils have less importance.

Some observers have been impressed by the scale and character of the works undertaken by the General Council; that, however, is not necessarily evidence of the value of the council system; the large resources available for expenditure are derived from a general tax imposed by government, not by the council, and the responsibility for expenditure and administrative control has remained in official hands. The test of the system must lie in the evidence which it affords of the capacity of its African members to undertake a more independent control of the interests committed to the council, and of their ability to secure support in raising fresh resources where necessary. The history of the territories has given their inhabitants a common sentiment and some sense of independence; the Bunga has had the benefit of the encouragement and guidance of a succession of officers who have identified themselves with native interests in the territories. It is agreed by all who have had experience of its proceedings that they have been dignified and well conducted; the African members have shown intelligence and a sense of responsibility for the interests of their community in debating the issues which have been laid before them; the expression of their views has been of great value to the official members of the council. Membership of the council has undoubtedly had an educative influence, but its African members have not yet been tested by the grant of any effective responsibility. It will only be possible to judge whether it constitutes a real organ of local self-government if official control is progressively withdrawn from its newly

¹ See above, pp. 355-6.

constituted executive council, and supervision from without takes the place of control within the General Council itself. The result will afford an indication of the success which the extension of similar institutions may be expected to attain elsewhere, and may further afford material for a decision as to the respective merits of the different systems of council organization adopted in the Ciskei and Transkei.

III. SOUTH-WEST AFRICA

In the mandated territory of South-West Africa circumstances have not yet called for any such discussion on native policy as marked the course of the debates on the Native Trust and Land Bill and the Representation of Natives Bill in the Union; of recent years, indeed, attention has centred, to the exclusion of other issues, on the problems relating to the definition of the political status of the German colonists. It must nevertheless be assumed that the interest of the Union in the development of European colonization will give it the same outlook on native affairs in the South-West as in the Union itself, though the manner in which policy manifests itself in practice may be affected by the existence of the mandate. The Union succeeded to a régime which had, save in Ovamboland, resulted in the complete disorganization of tribal institutions; indeed some tribes, such as the Hereros, had for military reasons been deliberately dispersed.¹ For some years therefore the primary concern of the administration was the re-settlement of tribes in the reserves.² In dealing with the native in his relations with the European community, the administration has taken over from the Union much of its differential system; native labour regulations have been adopted for the control of conditions of employment;³ a Masters and Servants law,⁴ a Vagrancy law,⁵ and pass regulations⁶ modelled on those of the Union are in force, and Proclamation 34 of 1924 regulating the conditions of urban natives includes the main provisions of the Union Natives (Urban Areas) Act of 1923. It is understood that

¹ *Report of South West Africa Commission*, U.G. 26, 1936, p. 23.

⁶ Proclamations 11 of 1922 and 20 of 1935.

a measure based on the Native Laws Amendment Act of 1937¹ may be applied to the location at Windhoek. The range of differential legislation is, however, less extensive than in the Union. More land is available for the native population; there is not the large 'poor white' community, the existence of which, as will be shown elsewhere,² has been the main ground for the legal restriction of the native in the Union to the ranks of 'unskilled' labour; nor have the conditions of native farm labour yet led to the adoption of the provisions of the Native Service Contract Act of 1932.³ It is clear that the course of differential legislation of this character will be largely determined by the fact that the rural economy is mainly pastoral, and that industrial activity is, as compared with that of the Union, on a small scale.

Native affairs are included in the subjects for which the Administrator legislates by proclamation. His advisory council includes one member nominated for his knowledge of native affairs. The organization of conditions in native areas is regulated by the Native Administration Proclamation of 1928, which applies the main provisions of the Union Native Administration Act of 1927. There are, however, important differences between these statutes; the former does not specially authorize the administration to confer judicial powers upon the chiefs, it stipulates that appeals from the Native Commissioner's Court shall go before the High Court and not a Native Appeal Court such as exists in the Union, and it does not withdraw from native commissioners jurisdiction over matrimonial cases where the marriage has been contracted by Christian or civil rites. Native customary law is formally recognized, and the chiefs have in principle the position of agents for preserving peace and for carrying out other similar functions which have already been described when dealing with the operation of the Act of 1927 in the Union. Conditions have, however, led to the adoption of a considerable variety of practice in different tribal areas. Ovamboland, even under German rule, was left to the operation of its own tribal organization, and it represents to-day the one area in South-West Africa in which this organization exists in any force, and can be utilized by the administration as an organ of government. Though the recognized court is that

¹ See below, pp. 501-2.

² See Chap. XI, pp. 684-6.

³ Ibid., p. 667.

of the native commissioner and the chiefs have not been given any defined judicial powers, they and their councils are in practice allowed to dispose of a large number of cases, only the more serious crimes being taken to the Native Commissioner's Court, where they are either tried as offences against customary law or transferred to the court of the magistrate. The institution of a Reserve Trust Fund,¹ into which all taxes are paid, and also the rentals of trading sites and tribal levies, affords some measure of local government, in so far that, while the responsibility for expenditure lies with the native commissioner, he is advised by a board consisting of the headmen and not more than six other native members, elected by the natives 'at a representative meeting'. Though the report of the Commission of 1936 speaks of the system followed in Ovamboland as one of 'indirect rule', this term could only be applied to it in the sense that it might have been applicable to the system adopted by Shepstone in Natal; but it is at the same time true that Ovamboland occupies a unique position in the territories administered by the Union, if judged by the extent to which a conscious effort is made to utilize tribal institutions. It is to be noted that the chiefs are the recognized authorities in three of the tribes; the other three are governed by a council of headmen. In the Police Zone—namely, the area to which European settlement is confined—the administration is still engaged, with a varying degree of success, in the attempt to reconstruct tribal organization.² Where a chief and council can be found to function, they are allowed much the same powers to dispose of native cases, and to associate with the management of the Reserve Trust Fund, as in Ovamboland; where, however, no such organization is active, as among the Damaras and Namas, cases go direct to the magistrate. The Bastards, residents in the Rehoboth Reserve, are of mixed European and non-European descent, and had claimed before the Enquiry Commission of 1921³ that they should be administered as a separate unit by their own council, which they elected in accordance with a constitution framed before the German occupation. It was recognized in 1923 by the administration under its

¹ Proclamation 9 of 1924 and Government Notice 157 of 1924.

² Of the population of 254,000 about 111,000 are resident in the Police Zone.

³ *Report*, U.G. 24, 1921.

agreement with the Rehoboth community,¹ but was suspended in 1924 owing to internal dissension. The functions of the council were vested in the magistrate, who is assisted by an advisory council which at first consisted of three nominated and three elected members; in 1935 provision was made for the election of all six members.²

The administrative control of native affairs is now exercised, under the Administrator, by a Chief Native Commissioner; in Ovamboland, Okavango, and four of the Police Zone districts, native commissioners have been appointed under the Native Administration Proclamation of 1928; elsewhere magistrates in charge of districts have also received powers as native commissioners. There is no separate department of native affairs. The character of the officers serving in this area is a matter of great importance, and the Union has hitherto had the benefit of the services of a certain number of officers of exceptional knowledge of the tribal areas. A special allowance is given to officers serving in South-West Africa, but it would nevertheless seem that some difficulty has been experienced in obtaining the officers required for enlarging the cadre of native commissioners; the task of reconstruction with which the administration is faced would seem, however, to demand an addition to the existing establishment.

IV. SOUTHERN RHODESIA

The nature of the control to be exercised over the conduct of native affairs formed a prominent issue when Southern Rhodesia received its constitution in 1923. The charter of the British South Africa Company had in general form prescribed respect for native religion, and for native customary law regarding the holding of land, marriage, and other personal rights, subject to any British laws in force in the territory.³ At a later date, Part V of the Order in Council of 1898, which created a legislative council, reserved to the High Commissioner special powers relating to the settlement of natives on the land; further, he could refer any question relating to natives to a judge of the High Court, and could act as

¹ Proclamation 28 of 1923.

² Proclamations 9 of 1928 and 5 of 1935.

³ Charter of Dec. 19, 1889, sects. 13-15.

he considered fit on the report received. A Secretary for Native Affairs was to be appointed; the selection of this, and of all other native affairs officials, was to be subject to the approval of the High Commissioner. It is of even greater importance that the Order in Council laid down that the company could not impose any disabilities on natives which did not apply equally to Europeans, without the consent of the Secretary of State, save in respect of the supply of arms, ammunition, and liquor. These provisions may be taken to indicate an intention to reserve to the High Commissioner the right to protect native interests, and also as an expression of the desire to control differential legislation of the type which had already become a feature of South African policy. Some of the problems which arose from the dispossession of natives from lands required for colonization, and the manner in which they were dealt with during the company's administration, are described in another chapter.¹ When the terms of the Southern Rhodesian Constitution of 1923 were being debated, the question of native rights in the unallotted lands had already been dealt with by the Privy Council;² the question of the general control to be exercised over natives, estimated to number 800,000, by a responsible government representative of a European population of 34,000, was referred for examination to a committee presided over by Lord Buxton.³ The committee considered that, if the new government was to be given responsibility for native affairs, the constitution should provide for a control similar to that exercised over the former company administration, or to that exercised by the Crown in the constitution giving self-government to Natal in 1893. Thus the provisions of the 1898 Order in Council relating to native affairs were maintained, the High Commissioner was given special authority in this respect, and the Governor was required to forward to the High Commissioner any information he might demand. The policy which dictated the insertion of these provisions also resulted in keeping open to natives the right of franchise.⁴

⁴ For the position of the High Commissioner in regard to native affairs and the native franchise, see Chap. VI, pp. 157-60.

From the beginning of responsible government native policy has tended towards the system of territorial segregation which has been developed in South Africa. In 1921 proposals were made to the Colonial Office that the High Commissioner should set aside specific areas in which alone natives might acquire land, and the inquiries of the Land Commission of 1925 were largely directed to finding some practicable means for achieving a territorial separation of the European and native population.¹ Legislative measures intended to enforce segregation have not been as extensive as in the Union, partly because the larger areas assigned to natives already provide some measure of separation between the two races, and make unnecessary any considerable re-allotment of land. The 'civilized labour' policy exists in principle,² but in the absence of any large 'poor white' community and of large industrial organizations it is less conspicuous than in South Africa.³ There is, nevertheless, a considerable body of differential legislation.⁴ The Land Apportionment Act of 1930 restricts native and European holding of land to separate areas,⁵ and the native 'squatter' is in process of being removed from European lands;⁶ the movements of natives are regulated by a pass system;⁷ the Native Urban Locations Ordinance of 1906 with its subsequent amendments controls the entry of natives to urban areas, and its provisions have been reinforced by the recent Registration of Natives Act;⁸ the Industrial Conciliation Act of 1934, which incorporates much of the previous legislation regarding labour disputes, and now practically regulates trade union operations, excludes natives from its scope;⁹ the Maize Control Amendment Act 17 of 1934 provided different marketing systems for native and European producers. The separate taxation of natives under a poll-tax system is of course a common incident in African territories, and is based on fiscal rather than racial considerations.¹⁰

In regard to the organization of conditions in native areas, the larger provision of lands for native occupation, and for their future

¹⁰ For native taxation, see Chap. X, p. 562.

extension, distinguishes the land policy of Southern Rhodesia from that of the Union. But the improvement of the condition of the reserves seems to demand a more liberal expenditure than the Rhodesian government has yet provided for it. The resources of the Native Trust Fund,¹ constituted in 1924 for the development of the reserves, are derived mainly from rents of trading sites, and are by no means considerable; the receipts in 1935 were only £5,286; and the government has never set apart any definite share of the proceeds of native taxation for expenditure in native areas. During 1936, however, Parliament voted £13,138, together with an additional loan of £22,000, for increasing water supplies and soil conservation in the reserves.²

The apparent disintegration of the Shona tribes after their subjugation by the Ndebele, and the defeat of Lobengula, who appeared to be the only powerful native authority, left on the first administrators an impression of general disorganization. The Matabele war and rebellion afforded an argument against attempts to restore the position of the chiefs, whose status was not clearly defined till the Native Affairs Ordinance of 1910 granted them powers in terms closely resembling those of the Natal Code; they ranked as constables responsible for law and order within their tribal areas, and in addition were required to assist in the collection of tax. The Native Affairs Act of 1927 confirms and slightly increases these obligations, but it is noticeable that a number of powers normally exercised by chiefs under native customary law, such as the allocation of land, are specifically reserved to native commissioners. In practice the use made of chiefs would seem to vary widely, and is everywhere largely of an informal character. Small payments are made to them as salaries. Native criminal law has not been recognized; some degree of recognition has, however, been given to native civil law. The Order in Council of 1898 laid down that in civil cases, courts should be guided by native law, so far as it is not repugnant to natural justice or morality or to statute law. The possibility that difficulty might arise in regard to the recognition of native marriages was obviated

¹ *Statute Law of Southern Rhodesia*, 1924, p. 357.

² B. Grimston, 'Native Affairs in Southern Rhodesia during 1936', *Race Relations*, vol. iv, no. 1, 1937, p. 22.

by a special declaration that polygamous native marriages might be regarded as valid. It may be added that while these provisions have served to prevent some of the anomalies which in South Africa marked the earlier treatment of native domestic law,¹ in Southern Rhodesia this law has been modified in important respects by statute, and through the interpretation placed upon it by the High Court. Attempts have been made, with somewhat unfortunate results,² to prevent by legislation the practice of child-marriage; the law forbids the pledging of children in marriage, and penalizes the use of compulsion to force native females into an unwilling marriage,³ and the courts have held that bride-price is only incidental to, and not an essential element in, native marriages.⁴ Up to 1937 the only courts administering native law were those of the native commissioners; the chiefs had no judicial powers, though they acted as informal arbitrators in minor civil disputes. But the omission to grant them any effective power progressively affected their utility even as arbitral courts, and it was officially suggested in 1935 that 'we have waited too long if it was our intention to establish native tribunals'.⁵ However, in 1937 an Act⁶ was passed by the legislature to allow native courts to hear cases between natives in matters capable of being decided according to native law and custom. Native courts are given no jurisdiction in actions in which the dissolution of a marriage is sought, or in matters which are punishable in the European courts as an offence. They have no criminal powers and are under the supervision of the native commissioners, who may rehear cases or alter or quash judgements.

The declining prestige of traditional authorities, on the one hand, and the influence of the Union policy of developing local representative institutions on the other, point to the adoption of the council system as the probable line of development in Southern Rhodesia. Article 47 of the Constitution of 1923 provided for the institution of native councils in the reserves. The 1925 Land Commission⁷ assumed that such councils would gradually come into

existence, in which case some of the functions of the Native Land Boards in the reserves might be transferred to them, but in the same year the Commission on Native Education¹ stated its opinion that natives were not yet fit to carry out the duties of such councils. In 1927, however, a conference of native commissioners advocated the adoption of the council system, and in 1930 it was decided, as a first step, to substitute for the meetings of chiefs and headmen, hitherto periodically summoned by native commissioners, a series of informal advisory boards which would include an equal number of elected members and of chiefs or headmen, with the native commissioner as chairman. These boards have been given no legal status, and in 1933 the Prime Minister doubted whether the natives were yet capable of understanding the process of election.² The village boards seem to have had some value in providing for an exchange of opinions with officials, but have had little real vitality; the Chief Native Commissioner,³ referring to their listless attitude, ascribed it to their lack of positive functions. More lately, however, it has been decided to make a fresh effort to develop the council system; it was announced in 1936⁴ that councils would be established wherever possible in 1937, and as a preparation for this measure a course of training for chiefs has been initiated at Dombashawa.⁵ An Act passed by the legislature in 1937⁶ provides for the establishment of these councils in the native reserves or in the native areas, where the natives apply for permission to form them. They will consist of chiefs or headmen appointed under the Native Affairs Act of 1927, and other natives approved by the Governor. The native commissioner is to preside. They will have power to carry out development work in their areas in connexion with water supplies, timber, and roads, also such matters as education, housing, and the improvement of stock. They may make by-laws in connexion with these works. Revenues derived from grants or fees are to be administered by the native commissioners who exercise the executive powers of the councils.

⁶ No. 38 of 1937.

The constitutional provisions for control of the High Commissioner over the Native Affairs Department, and their recent relaxation, have been described.¹ The present Prime Minister, in order to mark the importance attached by him to native development, has himself assumed charge of the Ministry for Native Affairs. At the end of 1927 a separate Department of Native Education was created, but, with the passing of the Native Development Act of 1929, education came under the charge of the Native Development Department, which had as its function the performance of all work concerned with native development; in this capacity it also took charge of agriculture in native areas. This created some difficulty with the Native Affairs Department, and in 1936 the control of the Chief Native Commissioner, who is also Secretary for Native Affairs, was extended to cover all native affairs; education was treated as a separate branch of the Native Affairs Department, with its own Director of Native Education. Native agriculture under an agricultural officer, and native lands under an assistant director, are now also branches of the Native Affairs Department. There are thirty-two stations, each in charge of a native commissioner, and of seventeen sub-stations fifteen are supervised by an assistant native commissioner. There exists an advisory council on native affairs, consisting of the Chief Native Commissioner and three other members appointed by the Governor; it deals with such matters as are submitted to it by the Ministry of Native Affairs.²

Among the constitutional changes proposed in 1935 and 1936, but not accepted by the imperial government, were the repeal of the provision for the reservation of bills differentiating against natives and the relaxation of imperial control over the disposal of native lands.³

V. KENYA

If Kenya has been included in the same group as the Union and Southern Rhodesia,⁴ it is mainly on account of certain points of similarity in the procedure of native administration; it could not

¹ See Chap. VI, pp. 157-60.

² Government Notice, Feb. 13, 1930.

³ *Proposed Amendment of the Southern Rhodesia Constitution*, Cmd. 5218, 1936, p. 6.

⁴ See above, p. 346.

with justice be said that the general policy of the Kenya government has the characteristic features presented by the two other countries. Whatever views may have from time to time been put forward by settler interests, and whatever the influence which these views may have had on the course of administration, the declared policy of the government must be taken to be that laid down in the various state documents to which reference has been made in Chapter V.¹ Much of the discussion which has arisen on political issues has had its origin in the problem created by the presence in Kenya of a large Indian population,² and it is possible that, but for this fact, the issues which concern the African population might have attracted less public attention. But the controversies first aroused by this problem stimulated a general interest in all questions concerning the non-European population; there was indeed a time when the position adopted by the British government towards native questions in Kenya was regarded in many quarters as a test of its native policy in the African dependencies generally. If to-day Nigeria and Tanganyika have also come within the sphere of public interest, Kenya still retains something of a special position.

The influence of European farming interests on Kenya policy has been exerted through the official and unofficial channels described earlier;³ it is true to say that, at certain periods, these interests have exercised an influence on policy hardly less than that which they might have attained under a fully developed form of responsible government. It is important, therefore, to realize the outlook of this section of the European population. It constitutes a comparatively small community, the actual number of land occupiers in 1934 being 2,027 out of a European population of 17,000, and embraces a proportion which, unlike most of the farmer element in South Africa, does not look on the land as the sole means of support for itself and its descendants; to this extent its interests may be said to be divided between Europe and Africa. Its concern, therefore, is primarily to safeguard European ownership in the Highlands area, in which its capital is invested, and to maintain an economy that will serve the standards of life of the class which it represents.

¹ Pp. 135-7.

³ See Chap. VI, p. 166.

² See Chap. VIII, pp. 335 ff.

It is true that, beyond these personal interests, it seeks to see Kenya as part of a predominantly British belt extending through East Africa; but though this may affect its general outlook on the part eventually to be taken by non-Europeans in the government of the country, it has had a less important influence on the current policy relating to native affairs. Circumstances have not produced the conflict of interests between the European and African which has marked industrial development in the Union; if there has been any conflict with European interests it has arisen from the position claimed by Asiatics in the political field and in regard to land settlement. In the industrial sphere the settler community has supported the tendency of Africans to replace Asiatic skilled labour.¹

These considerations explain in great measure the nature of the differential legislation applicable to natives; it deals primarily with the place of the native in the European farming areas, and has only in a minor degree been influenced by apprehensions of the result of contact in the industrial and social field. The procedure adopted for securing the highland area for European occupation will be described in Chapter XII.² It has had an interesting corollary in the legislation against the native 'squatter' on European farm lands.³ The Native Authority Ordinance of 1912 gave district officials the right to move back into the reserves all natives occupying unalienated Crown lands outside them if they belonged to tribes for whom land had been set aside, the main reason given for this measure being the prevalence of stock theft. As regards 'squatters' on private farms, the practice of 'Kaffir farming' was condemned by the Native Labour Commission of 1913,⁴ and prohibited by the Resident Natives Ordinance of 1918, which introduced provisions regulating the status of the labour-tenant, on the lines of legislation in South Africa; under the terms of this ordinance the contract may be for a period of not more than three years and must bind the tenant to work not less than 180 days a year for the owner. It was proposed in 1924 that the Governor should be empowered to waive 'in the public interest' the condition that remuneration must be in money, but this proposal was

¹ E. Huxley, *White Man's Country*, vol. ii, 1935, p. 180.

⁴ *Report*, p. 328.

negated by the Secretary of State. There was at first a tendency to secure as large a supply as possible of labour of this type, but in recent years it has met with disapproval for reasons similar to those which influenced South African policy regarding the tenant; there are complaints that he grazes too many head of stock to be an economic asset, that he is usually an inefficient worker and does not work for the full contract period, and that he is the cause of natives congregating on the farms, a practice which facilitates thefts of stock: also, owing to economic depressions and the need for soil conservation, mixed farming is more frequent and land once used for squatting is needed for pasture. A law was passed in 1933¹ dealing with stock theft by natives, which provides for the payment of a fine by a family or village when the offender is unable to pay. The history of the efforts made at various times to secure official assistance in recruiting farm labour is given in Chapter XI,² where an examination will also be found of the present system followed in regard to recruitment, pass laws, and the registration of natives. It may be added here that under the Vagrancy Ordinance³ special penalties may be imposed on natives who have left their reserves without permission after having been committed there for vagrancy. The regulations for the control of natives in urban areas are described in the last part of this chapter. The marketing of native produce has lately been made the subject of special legislation,⁴ but though the measure is differential in form, its main objective is to improve marketing facilities for native crops, and its terms resemble those of ordinances introduced in Uganda and Tanganyika.

The range of differential treatment is not, however, confined to legislation specially affecting natives; it is perhaps true to say that the influence of settler interests has in fact been seen even more conspicuously in the measures taken to support the European farming industry by reductions in railway freights on exports, or by the assistance given in the form of subsidies or loans.⁵ It may

be said that this policy has necessarily reduced the resources available for expenditure on improvements directly affecting natives, a consideration which lends importance to the study made by Lord Moyne¹ in 1932 on the position of the finances of the colony and the recommendations made by him for the institution of a Native Betterment Fund. At one period the administration indirectly assisted the European coffee industry by placing obstacles in the way of the production of coffee by natives; administrative officers, though no legal sanction existed to prevent the growth of coffee in the reserves, discouraged the practice and in some cases induced natives to uproot bushes that had been planted.² Later experience in Tanganyika and elsewhere has shown that if native production is adequately supervised by the Agricultural Department it is possible to prevent the danger of disease, and natives are now allowed to grow *arabica* coffee on an experimental scale, under the Native Grown Coffee Rules, 1934.³ It is proper to add, that of recent years administrative policy has directed increasing attention to the economic and social needs of natives. Evidence of this will be found in the sections of this study which deal with conditions in the reserves,⁴ and the activities of the Health⁵ and Education⁶ Departments.

Kenya may be said to stand midway between South Africa and the countries with a developed system of indirect rule in regard to the use made of native authorities in administration. There is a greater recognition of the value of such authorities than is shown by the Union or Southern Rhodesia: on the other hand, Kenya, unlike the countries in which the system of indirect rule prevails, does not seek support for its administrative measures in the use of traditional institutions. In a memorandum⁷ defining its policy in native administration, the Kenya Government explained that it had avoided any abrupt departure from established native custom or tradition, and sought to stimulate progressive changes in the condition of native life by fostering any indigenous system of local

⁷ Quoted by Sir A. Pim in op. cit., Colonial 116, para. 199.

self-government that might exist. It stated, however, that the political organization of government before the British occupation was of a very nebulous character. The functions of government were performed to a varying extent by irregular chieftains and indeterminate councils of elders; their authority was precarious; 'nowhere in Kenya was there any chief who could command the respect accorded to the Kabaka of Uganda, nowhere was there any ready made organization which could be converted into an administrative machine'. This statement is of importance, for it illustrates the criteria which the government of a colony with a considerable European population is likely to apply in judging of the value of traditional institutions as a basis of native administration; it is clearly prone to take a more exacting view than one which is concerned only with the administration of a native population. Whatever the justice of the estimate which the earlier authorities formed of the possibilities of the native institutions which they encountered, the policy they adopted had the characteristics of a direct rather than an indirect type of administration. Three stages can be distinguished in the development of their policy: the employment of headmen, the creation of native tribunals, and the institution of local native councils.

The appointment of headmen dates from 1902,¹ when they were charged with the duty of keeping order, apprehending criminals, and maintaining public roads; a section empowering the administration to give them authority to try petty native cases was repealed by the Courts Ordinance, 1907. The Native Authority Ordinance of 1912 further empowered them to issue orders on such subjects as the control of liquor, the prevention of water pollution, and the spread of infectious diseases. The jurisdiction of a headman extended over a 'location', an area which was roughly coincident with that over which some chief or council was found to be exercising authority. The administration sought in the first instance to engage the services of members of well-known families, appointed after consultation with the councils of elders concerned, and it became habitual in Kenya to give the headman the name of 'chief', though in many cases headmen so appointed had no traditional authority. There has of late years

¹ The Village Headmen Ordinance, 1902.

been an increasing tendency to consult local opinion in making selections; the headmen are chosen in public meetings, and in some districts local sentiment supports the principle of hereditary succession; in others, however, efficiency appears to be the main requirement. At the outset they were paid stipends ranging from 240s. to 1,800s. a year, but experience showed the inadequacy of this remuneration, and the minimum salary was subsequently increased to 480s. a year. At one period it was contemplated that a council of elders might be collectively appointed as headman, and this was indeed done in the case of the Masai in Uasin Gishu, but with the subsequent growth of the council system the tendency has been to confine the work of headmen to that which can be entrusted to individuals. The headmen were not at first used in the collection of taxes, but they are now being increasingly utilized for this purpose, a practice which would seem to involve some hazard, in view of the low range of salaries given to them.¹ They have in effect constituted what was officially described in 1925 as a native administrative service,² but it is possible to trace some change of attitude on the subject in recent years. Opinions at the present appear to be divided between the alternatives of making a wider use of chiefs possessing the influence of traditional authority, and of appointing men who through their education or experience are likely to show greater capacity as agents of the administration. In some areas there has been no effective authority over a larger unit than a clan; but in others there are traditional chiefs who still have a strong influence over a tribe, and though formally recognized only as headmen and remunerated as such, they are nevertheless treated as the principal agents of the local district officer. The annual reports on native affairs make frequent mention both of the value of chiefs in settling disputes and of the importance attached by tribes to decisions regarding claims to the chieftainship; the internal politics of North Kavirondo seem to turn largely on the question whether or not a paramount chief shall now be created. In general, experience seems to show that, in spite of the past attitude of the administration in regard to the position of the customary chiefs, there are some who still retain

¹ See Chap. X, p. 572.

² *Address of Acting Governor, 1925, Legislative Council, p. 15.*

an authority which it is difficult for the 'appointed' headman to achieve, and it is possible that Kenya, while maintaining the headman system in some cases, may in others find it politic to give more definite recognition to the traditional chief and his council as a native authority for executive purposes. If so, it might be advisable to begin by making some distinction in the pay of official headmen and traditional chiefs, for the remuneration given to the latter appears inadequate to the position they even now occupy.

The institution of native courts dates from 1913, when the first action was taken under the Courts Ordinance of 1907. In criminal matters the courts had jurisdiction to try 'minor' criminal offences arising out of native law and custom, a term which, as is shown elsewhere,¹ has a somewhat wide interpretation; they could order imprisonment up to six months on a warrant signed by the District Commissioner, and impose such native forms of punishment as were not repugnant to natural justice. Their civil jurisdiction included all disputes which did not involve property valued at more than 2,000s. These provisions have been maintained in substance by subsequent ordinances.² The Native Tribunals Ordinance of 1930 provides that the courts should be constituted in accordance with native law, but in practice they take a variety of forms which in many instances appear to have little connexion with the customary system; in some districts the tribunal is established for a particular location; in others its jurisdiction covers a number of locations, and, under this arrangement, it is customary to form the courts from a panel of elders, representing the different locations, who preside in rotation. The members are appointed by government, one being made president. The Ordinance also provides for the appointment of native tribunals to be courts of appeal from lesser tribunals. Headmen, including hereditary chiefs, have no recognized place in the judicial organization, though as individuals they may be appointed to the tribunals; in some cases they are regularly so appointed; in others they are explicitly excluded from membership. Stipends at either daily or monthly rates are given to sitting members out of receipts from

¹ See Chap. VII, p. 288.

² Ordinance 39 of 1930, amended by Ordinances 35 of 1932 and 31 of 1933.

court fees, supplemented by grants from the local native councils. The system involves a measure of separation of judicial and executive functions which is novel in African society, and there is a further departure from ordinary custom in the fact that the 'divisions' in which tribunals exercise jurisdiction do not necessarily correspond with tribal or clan areas. While the constitution of the courts may render the members less amenable to outside pressure or bribery, it at the same time removes the tribunal from the immediate influence of local public opinion, and its proceedings cannot count on that measure of acquiescence which a traditional institution seems able to secure. Some of the tribunals appear to work with considerable success, but it is noticeable, and perhaps natural in view of the official attitude towards native institutions, that their work is subjected to a more critical estimate by officers of the administration than is usual in countries where the doctrine of indirect rule has found acceptance. The growing association with European conditions in certain areas has led to complaints from progressive natives that the elders are unduly representative of conservative and uninformed opinion; but it appears to be generally admitted that the tribunals, if of unequal merit, nevertheless provide, within the range of litigation with which they deal, a form of justice which is preferred to that of the magisterial courts. The Kenya police have no power to act in the native reserves, except in special cases, and the enforcement of law is in the hands of the tribal police.

The development of local government institutions, as represented by the institution of local native councils, is of more recent date. An Ordinance of 1924¹ provided for the creation of a council in an area which might be a district or part of a district; in 1936 there were twenty such councils. In one sense, the councils may be said to be, as in the Transkei, an extension of the normal administrative system; the District Commissioner is the *ex officio* president, and all executive functions vest in him.² The members are appointed by government, but before any person other than an official headman is appointed, the natives of the area are given an opportunity to submit a list of suitable persons among whom

¹ Native Authority (Amendment) Ordinance, 1924.

² Native Authority Ordinance, 1933.

nomination is made. The councils obtain their revenue, which is paid into a local native fund, from the levy of rates, ranging from 1s. to 2s., from land rents, fees and royalties on common minerals charged within the reserves, and from the share due to them from the Native Trust Fund constituted in 1921,¹ into which are paid fines levied under the Collective Punishments Ordinance; they do not receive native court fines, nor any share of general taxation. The total estimated revenue of all native councils for 1936 was £83,882, of which £47,573 came from rates.

The resolutions passed by the councils deal primarily with such matters as the provision of roads, cattle dips, and markets, the regulation of forests, of public health and education, and the use of land; but the law contains an important addition, which distinguishes the Kenya councils from those of South Africa; their resolutions, when approved by the Governor in Council, have the force of law. The councils therefore constitute a subsidiary legislative body whose powers are not confined to the passing of local rules regarding such matters as the preservation of forest areas, protection of grazing and the like, but are utilized to define and modify native customary law. Reference is made elsewhere to regulations passed in the Kikuyu and Kavirondo councils on the subject of transfers of rights in land,² and other resolutions have dealt with questions such as bride-price, initiation ceremonies, female circumcision, and the compulsory registration of marriages; in one instance they made provisions for the registration of births and deaths.

The constitution of the councils appears to differ from district to district; of their members, who usually represent the locations or headmen's areas, about half are nominated, and the remainder appointed after election. As in the case of the native tribunals, the area over which the council has jurisdiction does not always correspond with tribal boundaries, and sometimes represents a variety of native communities. In the study of these institutions contained in his report on the financial position in Kenya,³ Sir Alan Pim has pointed out that though the councils can claim no basis in native

¹ See Chap. XII, p. 752.

² *Ibid.*, p. 849.

³ *Op. cit.*, Colonial 116, p. 109.

custom they have an advantage in providing an opportunity for the representation of the younger and educated part of the community, for whom it is sometimes difficult to find a place in any traditional tribal organization. Their resources, as he points out, are small compared with those of native authorities in Tanganyika or Nigeria, which receive a share of the native tax levied by government; not only, as already shown, does government make no contribution of this nature, but on occasion it has placed on them burdens, such as the provision of school-buildings and famine relief,¹ which should normally have fallen on the general revenues of the colony. They are by their constitution so largely under official control that it is not easy to determine how far they are likely to constitute genuine organs of local self-government, or to provide that field for native political ambitions which many who supported their creation expected to see in them.² It detracts from their educative value that their executive powers are limited; most of the major works for which they vote funds are carried out by government departments. The system under which names are sent up for nomination is in effect a type of election by consent, and though it is not easy to say how far the process is affected by influence, in many cases the election is real. Some of the councils show a genuine interest in their local affairs, and in the more advanced tribes, such as the Kikuyu and Kavirondo, the members by no means always echo the views of the District Officer; in the backward tribes he is himself the council for all practical purposes. They have clearly had a function of some value in enabling the administration to introduce measures which, if imposed by direct order, might have had a less ready acceptance, and they have provided a useful organ for the expression of native views. The system, like that of the tribunals, has not been fully stabilized, but is undergoing a constant process of reorganization, aiming at the evolution of a form which corresponds more closely with the customary institutions and, at the same time, permits the discharge of the new functions imposed by modern conditions. As was remarked in dealing with the councils in the Transkei,³ the potentialities of

¹ *Op. cit.*, Cmd. 4093, p. 31; *op. cit.*, Colonial 116, pp. 109, 110.

² See E. Huxley, *op. cit.*, vol. ii, pp. 154, 287.

³ See above, pp. 372-3.

these bodies will only become apparent if official control of their proceedings is progressively withdrawn, and replaced by supervision from outside. It is meanwhile significant that there are in Kenya certain native organizations, of which the North Kavirondo Taxpayers' Association and the Kikuyu Central Association may be quoted as typical, which receive subscriptions from the public and incur certain expenditure on educational and other objects; this fact would seem to suggest that the councils fail to provide the means for self-expression of which more advanced sections of the population have felt the need.

It remains to notice the official organization for dealing with native affairs. A post of Secretary for Native Affairs was created in 1908 but abolished in 1912. Following on the recommendation made by the Native Labour Commission of 1912-13, a post of Chief Native Commissioner was created in 1918; his functions were partly executive and partly those of an adviser to government. His semi-independent position and the artificial distinction between non-native and native affairs which his office was held to involve have made his position the subject of some difference of opinion, but the Joint Committee on Closer Union¹ attached importance to the retention of his post, and the recent proposals for the reorganization of the head-quarters establishment in Kenya² envisage its continuance. With this exception there is no separate staff dealing with native affairs, though they are the predominant concern of the sections dealing with labour and the registration of natives. The local administrative staff (provincial and district commissioners) deal with both non-native and native affairs; their authority over the headmen, the native tribunals, and the local native councils is defined in the ordinances regulating these institutions. The technical departments of government deal similarly with both native and non-native affairs.

VI. THE HIGH COMMISSION TERRITORIES

If in South Africa the term 'native administration' must be interpreted as expressing the separate régime applicable to natives in a country governed primarily in European interests, in the High Commission Territories it has almost an opposite meaning;

¹ *Report*, H.C. 156, 1931, para. 87.

² *Op. cit.*, Colonial 116, pp. 56-78.

it describes the system of control exercised over the traditional native authorities who are mainly responsible for the internal government and administration of justice in an area where European interests are less important. There are considerable differences both in the basis of this control and the manner in which it is exercised, and consequently in the degree of independence left with the native authorities; and it will be necessary to trace briefly the steps by which the present position has been reached in each of the territories concerned.

(a) *Basutoland*

The history of the political relations with Basutoland has been given in detail by Sir Alan Pim in Chapter II of his report on that territory,¹ and it will be sufficient to refer here to certain critical points. The stipulations which Moshesh made in 1862, when discussing the terms under which protection should be extended to Basutoland, contemplated little more than political control: 'the Queen rules my people only through me. The man whom I ask from the Queen to live with me will guide and direct me.' He asked that magistrates should not be sent; the people were to be governed by native law, but if other laws were to be introduced they should come into effect only after they had been accepted by the council of the Basuto. The Basuto continue to read into these stipulations their own interpretation of their relations with the British government. The Proclamation of 1868, which annexed Basutoland to the Crown, admitted the Basuto 'into the allegiance of Her Majesty', and declared that they should be taken to be, for all intents and purposes, British subjects and the territory to be British territory; but at the outset relations were guided by the spirit of the discussions of 1862, rather than by any assumption that the British had acquired sovereign rights. In 1870 a Pitso or general meeting of the Basuto agreed to the appointment of two or three magistrates, the introduction of a code of law, which would conform as far as was reasonable to native usage, and the imposition of a hut tax of 10s.; the collection of the tax began in the same year, but considerable delay occurred in the appointment of magistrates and no code was promulgated. In 1871 the territory

¹ Cmd. 4907, 1935.

was annexed to the Cape Province, but with the proviso that legislative powers should vest in the High Commissioner. In the following year a new code, much resented by the Basuto, was introduced. It interfered with tribal customs in connexion with the status of widows and with initiation ceremonies, assigned to government the right of allotting land for cultivation, and provided for appeals from chiefs' courts to those of the magistrates, who had by this time been appointed. The grant of responsible government to the Cape in 1872 withdrew legislation in Basutoland from the control of the High Commissioner; but the change made little difference in the actual position in the territory until the extension of the Peace Preservation Act and the threat of disarmament were followed by the 'Gun War' of 1880-2. The cost of the campaign induced the Cape to invite the British government to resume control over the territory; the majority of a Pitso held in 1883 expressed itself as willing to accept the authority of the High Commissioner, and to pay taxes; in 1884 an Order in Council was promulgated which notified the Crown's assent to the Cape Bill dis-annexing Basutoland,¹ assumed direct imperial control, and restored legislative and executive power to the High Commissioner. In the same year Proclamation no. 23 was issued, empowering the High Commissioner to make by proclamation such laws as might appear necessary for the peace, order, and good government of the territory, and to appoint officers and magistrates.

This proclamation is the source of the authority now exercised by the Crown in Basutoland, and it is important to note the character of the regulations² issued in 1884 to give effect to its provisions. Save for provisions relating to marriages, hut tax, trade licences, and the sale of arms and liquor, they referred mainly to the control of judicial administration. The Resident Commissioner received full civic and criminal jurisdiction, and Assistant Commissioners exercised jurisdiction within the terms of their appointment; it was at the same time declared lawful for any native chief appointed by the Resident Commissioner to try civil or criminal matters within limits defined by the Commissioner. An appeal lay from the chief to a court composed of himself and

¹ i.e. from the Cape Province.

² Proclamation 2B, 1884.

an Assistant Commissioner, and thence to the Commissioner. The law therefore secured to the administrative officers a wide field of jurisdiction, limited only by administrative order, and proposed for the chiefs only a subordinate judicial authority. This provision was from the first strongly opposed by the Basuto; in practice chiefs were not formally appointed and all of them continued to exercise their customary jurisdiction. In effect this continues to be the practice to-day. In 1928 and 1929 proposals were drafted for defining the powers of chiefs and the organization of native courts; the chiefs objected to what was described as interference in the 'domestic affairs' of the Basuto, of a nature not contemplated in 1862, and the draft proclamations were never issued. The previous procedure has only been so far modified as to provide that under certain conditions a native may apply for his case to be heard first by the court of the paramount, and, in the event of unreasonable delay or refusal, by the administrative courts, to which an appeal lies in all instances.¹ The British courts have exclusive jurisdiction over certain criminal cases, such as murder, violence, and offences against arms and liquor regulations, and cases involving Europeans. It is an important feature of the system that there is no supervision of the chiefs' courts, save in so far as this may be implied in the existence of the right of appeal, nor is there any rule prescribing the form in which records, if any, should be kept by them. Basutoland is divided into 'wards', each under a hereditary chief. The chief sits with his Kgotla, an informal body composed according to custom; the courts apply customary law, as embodied in the Laws of Lerothodi;² though they cannot impose imprisonment they benefit by taking the fines imposed; the number of tribunals constantly increases owing to the system of 'placing' younger sons as new chiefs,³ and complaints regarding delays and miscarriages of justice frequently appear in the communications of the Resident Commissioners to the National Council and have been voiced in the National Council itself.

The judicial system is, therefore, in the nature of a dualism, and the same feature reappears in an equally significant form in the

¹ Proclamation 20 of 1930.

² See Chap. XI, pp. 609-10.

³ Op. cit., Cmd. 4907, p. 48.

executive field. On the one side, the system of native rule is represented by the paramount and his subordinate chiefs, over whom he has a measure of control that has varied with his own personality, but has a strong tradition behind it. The chiefs do not draw their powers from appointment or formal recognition by government; it would seem that in practice a chief can be punished only by the paramount, and 'removal' of a chief by the administration, if not accompanied by expulsion from the territory, would be ineffectual in the absence of any power to prevent his holding a court. Several unsatisfactory chiefs have recently been removed by the administration acting with the paramount chief. The administration has a direct hold over chiefs only through the payment or withholding of allowances, which in the estimates of 1935-6 stood at a total of £10,695. If the powers of the chiefs are anywhere defined, it is only in the Basuto Code of Lerothodi, and not by the administration; apart from the authority always implicit in the use of more or less unregulated judicial powers, the code gives them a wide power over the distribution and allotment of land. They derive their income from their own lands, for the cultivation of which they claim free service, from unregulated levies, and from judicial fines. The number of chiefs and sub-chiefs exercising judicial powers is said to be 275. Side by side with this system of Basuto authority there exists the machinery of the British administration which levies taxes and takes dues and fees, and provides communications, educational, medical and other facilities. The paramount is nominally responsible for the collection of the native hut and poll tax; the actual system is described elsewhere.¹ Where it is necessary to control health, veterinary, forest, or similar conditions, the Resident Commissioner has the option of calling on the native authorities to make these rules themselves, or of making them by regulation; in the latter case their penal clauses are enforced in the British courts. Thus the administration was able to induce the chiefs to pass rules about eradicating burrweed; but it had itself to pass regulations controlling cattle-disease.

Some effort to systematize the relations between the British and native authorities was made when the Basutoland National

¹ See Chap. X, pp. 558-60.

Council was instituted. This body grew out of the national Pitso, a general meeting of the men of the tribe of which the first recorded was in 1870; informal meetings were held at the suggestion of the Resident Commissioner between 1903 and 1910, and in the latter year a government proclamation placed the Pitso on a permanent basis.¹ It meets annually and is presided over by the Resident Commissioner; of its 100 members ninety-four are nominated by the paramount with the approval of the Commissioner, and five by the Commissioner directly. There has been a movement on the part of a Progressive Association, formed by the younger generation of educated Basuto, to secure a measure of elective representation, but so far it has only succeeded to the extent that the Commissioner nominates one member to represent it; both in form and in fact the Council is an association of chiefs, and has been conspicuously conservative in its outlook. Its most definite function is legislation on the subject of Basuto law. The Council in 1903 adopted the native code known as the Laws of Lerothodi, in effect an authoritative collection of customary laws, and has at subsequent dates made some modification in the code, though the conservative and partisan attitude of its members has prevented any change which would reduce the authority of chiefs; it has in particular strenuously resisted any definition or restriction of their judicial authority. Formerly it opposed the growing of trees, a measure essential to the arresting of 'donga' erosion, on the ground that tree planting may give the occupier a claim of user which may outlast the chief's lifetime; it resisted on the same ground the introduction of fencing.² But a new spirit is now at work and plantations and fencing are both accepted. The competence of the Council vis à vis the British authorities is limited to the passing of resolutions; it is within the discretion of the Resident Commissioner whether the budget estimates shall be referred to it, and taxes have on occasion, for instance in 1920, been raised against the wishes of the chiefs.

The disadvantages of this system of rule are obvious. It gives political protection, but divides responsibility; it provides for

¹ Proclamation 7 of March 31, 1910.

² L. Barnes, *The New Boer War*, 1932, pp. 64, 65; M. L. Hodgson and W. G. Ballinger, *Indirect Rule in Southern Africa: Basutoland*, 1931, p. 26.

intervention without defining its limits, or the principles on which it shall be made. Their history has given the Basuto a strong sense of nationality, and a firmly fixed ideal of Basutoland as a semi-independent state, which has accepted political control as the price of protection, but whose domestic affairs are, subject only to advice from without, to be regulated from within by the traditional authorities. Their ideal, therefore, is that of a constitutional position similar to that of the Indian State; but their circumstances are in fact entirely different. The Indian prince is, subject to the suzerainty of the Crown, sovereign in his own state; he is not hampered by the existence of a great number of lesser chiefs, each based on his own traditional authority and owing loyalty rather than feudal obedience to a paramount. The canons of good government are in India no longer confined to Europeans; an Indian prince not only has the requisite authority to adjust his administration to modern requirements, but, apart from any pressure from the suzerain power, he frequently has the stimulus of public opinion in his own state. In Basutoland not only can every reform be obstructed by self-interested chiefs, but reform itself has come to be viewed as an invasion of Basuto authority by an external power, and doubly so when it has to be introduced by regulation under the Proclamation of 1884. In the security afforded by protection there is a strong temptation for the chiefs to be more and more concerned with asserting their rights, and less mindful of their duties. On the other hand, the British authorities are prevented by a traditional policy of respect for Basuto institutions from applying that measure of external pressure which would normally be the remedy for this situation. In his analysis of conditions in Basutoland¹ Sir Alan Pim has shown that, apart from problems arising from its economic dependence on South Africa, there are questions of internal development, in the shape of agricultural, health, and educational improvements, which demand urgent attention. As he points out, a more effective administration, unless it is secured by supersession of the native authority, can only be achieved by the revision of a system in which the chiefs enjoy so large a measure of uncontrolled and undefined power. The council has little to recommend it as a potential organ of govern-

¹ *Op. cit.*, Cmd. 4907, p. 81.

ment. There is, as has already been said, a strong feeling of national cohesion among the Basuto, and perhaps the most acceptable form for the reorganization of native authority would be the centralizing of power in the hands of the paramount and his council by regulating the judicial and executive authority of the chiefs; it should be possible to secure, by the composition of the paramount's council and by the control exercised over it in its rule-making capacity, an instrument which could be progressively adapted to the needs of improved administration. One fundamental consideration, however, vitally affects the prospects of securing any agreed measure of reform. The tradition of independence is not merely a political sentiment; it has its origin in a history which has made the Basuto, not without reason, apprehensive of dispossession from their lands. Agreed improvement in the system of government will only be possible if they can be convinced that no change which may be made, either by the British government or by the Union if they come under its control,¹ will endanger their lands.

(b) *Swaziland*

The system of rule in Swaziland is also in form one of dualism; but the balance of forces differs from that in Basutoland. Whereas Europeans hold little land in the latter territory, in Swaziland the Concessions Partition Proclamation of 1907² and subsequent land transactions have left about two-thirds of the area in the hands of Europeans, who have also considerable mining interests.³ No less than 20,000 of the native population, or roughly one-sixth of the whole, is resident on lands held by Europeans; the native lands are comprised in some thirty-one separate blocks. Though the Swazi have a national sentiment, evidenced in particular by their efforts to combine for the repurchase of lands alienated to Europeans, by their opposition to any measure which appears likely to affect the security of the areas remaining to them, and by their efforts to secure a 'national' type of education,⁴ they do not constitute so strong a political unit as the Basuto. The

⁴ H. Beemer, 'The Development of the Military Organization in Swaziland,' *Africa*, vol. x, nos. 1 and 2, 1937, pp. 195 ff.

conventions of 1881 and 1884 between Great Britain and the South African Republic¹ guaranteed the independence of Swaziland; but in 1890, when a joint administration, representative of the British government and the South African Republic, was established over Europeans, a judiciary was instituted for dealing with European cases. In 1894 the South African Republic was given powers of administration under a convention² which provided that the management of the internal affairs of the natives should be in accordance with their own law and custom, administered by the native chiefs in their own manner, so far as consistent with civilized law and custom; it further provided for a hut tax, but limited its rate. A protocol of 1898 removed from the chief the right of inflicting capital punishment, and reserved for trial by European courts all offences of a serious nature. In 1903 an Order in Council entrusted the administration of the territory to the Governor of the Transvaal, who ruled through a special commissioner; the order indicated a policy of respect for native law, but confined the authority of the chiefs to the exercise of civil jurisdiction in purely native matters. Changes were made in 1904, but these may be neglected; in 1907, when responsible government was granted to the Transvaal, a proclamation giving effect to the Order in Council of December 1, 1906, which placed Swaziland directly under the control of the High Commissioner, introduced a system substantially the same as that in force to-day. The proclamation limited the jurisdiction of native chiefs to civil cases; an appeal lies from the decision of any chief to the paramount and from him to the Special Court;³ he may be called upon to give reasons for a judgement. The jurisdiction of the chiefs' courts is not further defined by law, nor are their proceedings supervised by the British administrative officers. All criminal cases are heard by the British courts.

Executive authority is also exercised by virtue of the Order in Council of 1906 and the Proclamation of 1907; but a distinction is observed in the administrative treatment of non-native and native affairs. In 1921 an advisory council was instituted to assist the administration in purely European matters; it has nine elected members, and the budget and draft legislation are referred

¹ Sir E. Hertslet, *The Map of Africa by Treaty*, vol. i, p. 254.

² *Ibid.*, pp. 255-7.

³ Proclamation 63 of 1934.

to it. In regard to purely native affairs, the position of the traditional authorities is not anywhere defined; no administrative duties appear to have been formally imposed on the chiefs, although since 1930 their help has been enlisted in the collection of tax and the registration of native customary marriages. The budget provides an average of £1,600 a year on allowances to them; a Proclamation, No. 7 of 1927, subjected their power of raising money levies to the sanction of the administration.

The Swazi meet annually in a general assembly, but this meeting has not been given the same constitutional position as the National Council in Basutoland; it is, however, the custom for the Resident Commissioner to keep in informal communication with the paramount and his council, and since 1931 they have been consulted on the disposal of the Swazi National Fund, instituted by Proclamation 24 of 1911 for native education and the improvement of agricultural conditions. The fund is financed by a sum of 2s. deducted from every native poll tax collected and from rents of native grazing areas; the estimated revenue in 1932-3 was £2,650. A practice was also instituted of holding monthly meetings in each district of all the chiefs, under the presidency of the local administrative officer. Committees, elected at informal public meetings, have been formed to represent the views of educated natives and coloured persons on current questions; they meet twice yearly at head-quarters for discussion. The system appears to depend on informal understandings rather than on regulations, and it is possible that any more systematic scheme might present questions of some difficulty owing to the necessity of serving both European and native interests. On the other hand, the present system does little to stimulate a sense of responsibility in the Swazi, and economic developments seem to be producing a progressive disintegration of such traditional institutions as still exist.

(c) *Bechuanaland*

The circumstances which have determined the course of native administration in Bechuanaland differ from those both of Swaziland and Basutoland. While there are in Bechuanaland considerable European interests, as represented by the farms on the

eastern border, including the Tati District (controlled by the Tati Company), the Lobatsi, Gabarones, and Tuli blocks (the last two controlled by the British South Africa Company), and the Boer settlement at Ghanzi near the border of South-West Africa, European and native lands are not interspersed as in Swaziland; it is possible to separate European and native interests in considerable measure. There is, on the other hand, little of the sense of nationality which characterizes Basutoland and to some extent Swaziland; the ruling tribes now known as the Bechuana derive from a common stock, but are politically independent of each other, and there is no paramount chief or national organization. The native reserves¹ do not contain single tribes, but sections of different tribes subordinate to a ruling tribe. Though the extent to which these sections have been incorporated in the ruling tribe within a comparatively short period is evidence of the unifying effect of the African tribal organization, yet the cohesion is by no means complete, and there is frequently a difference in status between the members of the ruling and subordinate tribes. The crucial problems of administration arise, however, less from these conditions than from the exercise of their political authority by the chiefs, accentuated by the growing extent of the migration of labour from the southern reserves into the Union.²

The absence of any symbol of national unity gives a less marked impression of dualism in the administration than is presented by Basutoland. As there has been some controversy as to the nature of the rights exercised by the Crown in the protectorate, it is of interest to mark the stages by which the present position has been reached. In 1876 Khama, the Ngwato chief, applied unsuccessfully for the protection of Great Britain. In 1884 Sir Charles Warren was given a commission to act on behalf of the Crown in Bechuanaland; but his authority was limited to restoring order and securing the territory against incursions from the Transvaal. The Crown concluded treaties with the chiefs of two southern tribes, the Thlaping and Rolong, which gave it full jurisdiction to

¹ See Chap. XII, pp. 730-2.

² *Financial and Economic Position of the Bechuanaland Protectorate*, Cmd. 4368, 1933, p. 31; M. L. Hodgson and W. G. Ballinger, *Britain in Southern Africa (No. 2) Bechuanaland Protectorate*, p. 17.

publish laws and appoint magistrates in their area; and when in 1885¹ it extended British jurisdiction over Bechuanaland, it made a distinction between the territories of these two chiefs and the rest of the country. Their territories were shortly after constituted a Crown colony, and in 1895 annexed to the Cape as British Bechuanaland; elsewhere jurisdiction was assumed only over British subjects. Great Britain did not regard itself as having sovereignty in the area now included in the protectorate; the High Commissioner on January 23, 1885, wrote that as the position of the Crown there did not amount to sovereignty the waste lands were vested in the chiefs and not in the Crown, and this view was accepted by Lord Derby as Secretary of State in a letter of May 14, 1885. In the same year Sir Charles Warren had discussions with the chiefs of the Ngwato, Kwena, and Ngwaketsi. The first two stipulated that if administration were extended, the native law against intoxicating drinks, and also that declaring native lands to be inalienable, should be maintained, adding that they would not refuse advice but wished to rule over their own people. The dispatch of the Secretary of State of August 13, 1885, however, refused to accept any responsibility for administering the area held by these chiefs; he stated that a large proportion of the country north of the Molopo was unsuitable for European settlement, and while recognizing the importance of the trade routes, Great Britain was interested in it to a very limited extent. The Kwena chief was told by the Administrator of British Bechuanaland that the protectorate meant only defence against foreign encroachment; 'you are still chief over your own town and people as before'; a reply which was approved by the British government in March 1886. Similarly the Ngwato chief was told in 1887 that he could not claim assistance in settling his internal troubles; 'he is an independent chief'. The first Assistant Commissioner sent to Bechuanaland in 1887 was instructed that he was to assist the chiefs to repel the invasion of their territories by outsiders, but to abstain from interfering with native administration; the chiefs 'are not understood to be desirous to part with their rights of sovereignty, nor are her Majesty's Government by any means anxious to assume the responsibilities of it'.²

¹ Order in Council, Jan. 27, 1885.

² Imperial Blue Book C. 5237, 1887.

The conception underlying the original theory of a protectorate depended for its operation on the protecting power finding a strong political organization in existence; here, as elsewhere, it broke down when no such conditions were encountered. In 1890 the Foreign Jurisdiction Act was passed, and on May 9, 1891, an Order in Council was issued under it, authorizing the High Commissioner to provide by proclamation 'for the administration of justice, the raising of revenue, and generally for the order and good government of all persons'; in issuing proclamations he was instructed to respect native custom, so far as it was compatible with the 'due exercise of her Majesty's power and jurisdiction'. The terms of the dispatch of May 15, 1891, which accompanied the order are important. They directed that jurisdiction should be confined so far as possible to Europeans, leaving the native chiefs and persons living under their tribal authority almost entirely alone; 'for the extent of jurisdiction exercisable by her Majesty over the natives has not yet been accurately defined'. The proclamation of June of the same year provided for the appointment of magistrates whose jurisdiction was confined to Europeans or cases involving natives of different reserves, but in the interests of peace it could be exercised in matters concerning inhabitants of the same reserve. When the discretionary jurisdiction was assumed, the magistrate was to follow the law and custom of the natives concerned so far as they were not opposed to peace, order, and good government. The Order in Council of 1891 is still the authority upon which the High Commissioner acts in issuing proclamations. Whatever doubts were at first felt as to the extent of the jurisdiction conferred over natives by the declaration made under the Foreign Jurisdiction Act,¹ no doubt now exists as to the competence of the government to exercise the fullest legislative authority. This position has been twice substantiated by the courts in Bechuanaland itself.² A protecting power may find itself limited by treaty or other form of commitment in the extent to which it can properly exercise its authority, but there was in this case no treaty restraining the Crown from intervention, to any extent

¹ See Chap. VII, p. 272, and Chap. XII, p. 799.

² *Rex v. Crewe, ex parte Sekgome* (1910) 2 K.B. 576, and *Tshekedi Khama and Bathoen Siepapitso Gaseitsiwe v. The High Commissioner, Special Court of the Bechuanaland Protectorate*, Lobatsi, 1936.

which policy might dictate, in the sphere of authority exercised by the chiefs. The various declarations made up to this point constituted statements of the policy of the protecting power rather than commitments to the chiefs; but in 1895 the British government made an announcement which was clearly meant to imply a definite engagement to them. The government had shortly before declared itself in favour of handing over the administration to the British South Africa Company. The three great chiefs, Khama, Sebele, and Bathoen, came to England to protest, and in spite of a discouraging reception, their insistence won from Mr. Chamberlain an agreement that, if they gave up the strip of land needed for the construction of the Rhodesian Railway, they should remain, as they had asked, under the administration of the British Crown. The Colonial Office letter of November 7, 1895,¹ which announced this settlement went on to say that the three chiefs would 'have a country within which they shall live, as hitherto, under the protection of the Queen. . . . The chiefs will rule their own people much as at present. . . . The Queen's officer will decide all cases in which white men, or black men who do not belong to the tribe of one of the three chiefs, are concerned, or in which the punishment is death. He will also have a right to hear an appeal in any very serious case, even if the punishment is not that of death. The people under the chiefs shall pay a hut tax, or tax of a similar nature, but, as the chiefs wish it, they may collect it—at all events for the present—themselves and pay it over to the Queen's officer.'

This settlement cannot be regarded as constituting in the legal sense a condition on which the chiefs surrendered their jurisdiction, for they had been under British protection for some years when it was made; at the most, it could be treated as a condition on which they agreed to give up the railway lands; but it was nevertheless the first occasion on which the character of the powers assumed by the Crown had been explicitly discussed with the chiefs, and it has not unnaturally been treated by the Bechuana as a pledge binding on the British government. It is therefore of interest to examine the extent to which Crown rule since 1895 can be said to have conflicted with any commitment then made. The action

¹ Quoted in the *Explanatory Memorandum on the Bechuanaland Protectorate Native Administration and Native Tribunals Proclamations*, 1934, p. 2.

taken in regard to native lands is described later;¹ it has not anywhere been claimed that the tribes have since been deprived of lands in the interests of European colonization. The judicial system in force up to the issue of the Proclamations 74 and 75 of 1934, to which reference will subsequently be made,² encroached only to a minor extent upon the jurisdiction of the chiefs. Under Proclamation 2 of 1896 provision was made for the transfer to the Crown courts of all charges of murder; under 3 of 1912 cases of stock theft were brought under their jurisdiction, though not excluded from trial by the chiefs; under 1 of 1919 appeals against the decision of chiefs were to be heard by a combined court composed of the magistrate of the district and the chief. A comparison with the extent of the powers left with native authorities in Basutoland and Swaziland will show how relatively wide was the jurisdiction thus left with the Bechuana chiefs. No system of supervision was introduced over the tribal courts, other than that implied in the procedure for appeals. Trial in a chief's court, though in form a trial by the tribal council or Kgotla, has tended under modern conditions to leave the decision largely in the hands of the chief. The political organization of the Bechuana includes three types of councils; the first consists of a small privy council of relatives and trusted subjects who advise the chief on all matters of importance; secondly, a wider council comprising the hereditary headmen of the different wards, which was summoned in cases of emergency; and, thirdly, a full tribal assembly of the initiated men. There is evidence that this last body exercised an effective power under earlier conditions; it was regularly summoned, and all affairs of state were freely discussed; and since the tribes had a constant tendency to split up into sections under sub-chiefs, a head chief had every incentive to maintain his position by carrying the majority with him. All observers agree that the establishment of the protectorate, by affording the chiefs an alternative basis for their authority, has tended to make them less dependent on tribal assent and to give them a position of autocracy uncommon in Africa.

The chiefs, with the exception of those who have proved inefficient, have been made responsible for the collection of taxes, and

¹ See Chap. XII, pp. 730-2.

² See below, pp. 409-11.

in practice deal with cases of default.¹ Reference has been made elsewhere to the use made by the chiefs of the regimental system for securing personal services;² though generally reluctant to let their tribesmen go outside the territory to engage in wage-earning, they have on occasion assisted in recruiting those who were in arrears with their tax, or taken tribute from men on their return; and some of them receive also payments in respect of mining concessions and trading sites. It has been estimated that from various sources of revenue the Ngwato chief derives an annual income of approximately £7,000, the Kxatla chief £4,500, the Ngwaketsi chief £3,500, and the Kwenä £2,750;³ but Sir Alan Pim has noted that a considerable part of these revenues are ear-marked for tribal purposes, and it is open to doubt whether any substantial balance remains for the chief's own pocket. At the same time the administration is not in a position to exercise supervision over the expenditure of these revenues save in three reserves, where the whole or part of the tribal income has been taken over from the sole control of the chief. In the Ngwato reserve, moneys received in respect of a mining concession are paid into a trust fund, under the administration of five trustees, of whom three are appointed by the tribal council; in the other two reserves, the administration has taken control over the income owing to the incapacity of the chiefs.

In the general administration the Crown officers are responsible for the expenditure of the revenues derived from hut tax, customs duties, and other sources, and for carrying out the regulations issued from time to time in matters regarding health, cattle disease, and the like, breaches of which are dealt with by the magistrates' courts. In 1920 an advisory committee was created for European affairs, and a native advisory council was instituted in connexion with the administration of a native fund for local development, representing the proceeds of an additional tax of 3s., first imposed in 1919⁴ and raised in 1923 to 5s. The income of the fund in 1931-2 was £7,952. The proceedings of the Native Council have been robbed of some of their value by the fact that the Ngwato,

¹ See Chap. X, p. 560.

² See Chap. XI, p. 610.

³ M. L. Hodgson and W. G. Ballinger, *op. cit.*, p. 65, note.

⁴ Proclamation 47 of 1919.

who contribute 40 per cent. of the revenue, declined representation on it, though their chief attends the meetings as an observer.

This system remained in force until 1934. As will have been seen, it gave the Crown officers a limited jurisdiction in criminal issues, and influence, but not direct control in executive matters. In practice, an undefined authority of this nature can often best express itself in the giving of advice or the exercise of official influence; but the efficacy of this procedure depends largely on the personal factors existing on both sides. Whether or not the Crown officers have in the past always made the best use of their position, it is certain that a situation was created which militated against good administration. That some of the chiefs were responsible for grave abuse of their judicial powers and for a wasteful use of tribal resources was notorious, and the administration had no effective power of checking them. The difficulties encountered in improving the position of the Masarwa serf population¹ illustrate the extent to which they were able to obstruct measures of reform. On the other hand, the safeguards which earlier custom applied to the use made by a chief of his authority are tending to lose their force. All the evidence goes to show that the institution of chieftainship still commands great respect; but the growing autocracy of the chiefs, meeting in its turn a growing consciousness among tribesmen, the result of experience gained by them either in trading in European markets or as wage-earners outside the territory, was producing conditions which might have led to a disintegration of the tribal structure. If this structure was to be preserved, the only course which appeared open to the administration was to regularize the position of the chiefs, and to restore to their councils some of the position which previous custom had given to them; failing this, it was inevitable that there must be a progressive intervention by the Crown officers in judicial and administrative matters.

The former course was adopted in two Proclamations, Nos. 74 (Native Administration) and 75 (Native Tribunals) of 1934, the issue of which was accompanied by an *Explanatory Memorandum* from the High Commissioner, dated December 28, 1934. The Native Administration Proclamation confirmed in the chieftain-

¹ Op. cit., Cmd. 4368, p. 10.

ship all chiefs who were lawfully holding office, and gave legal sanction to the native laws of succession to chieftainship by providing that, in the event of a vacancy, the tribe assembled in Kgotla is to designate the former chief's successor, who will exercise the functions of a chief after he has been recognized by the High Commissioner and confirmed by the Secretary of State. The chief and his Kgotla designate the persons who under native custom are entitled to advise him as councillors, and their names are notified to the Resident Magistrate. Provision is made for cancelling the nomination or ordering the suspension of a chief by the administration, on proof of inefficiency or oppression; in this case an acting appointment is made in his place by the process above described; he may only be finally deposed by the tribe itself with the authorization of the High Commissioner after inquiry by the Special Court. As in Swaziland, the right to raise a levy is made subject to the consent of the Kgotla and the administration, and the conditions on which compulsory labour may be exacted are defined. There is a provision requiring the chief to exercise his authority in consultation with his councillors. The *Memorandum* indicated that it was desirable that this body should include not only those qualified by right of birth, but those also who were qualified by experience or education; while not making their appointment obligatory, the proclamation provides that the chief and Kgotla may designate as councillors persons who are not entitled under native custom to act as advisers. The chief may issue orders for purposes defined under eighteen heads. These include the regulation of the sale of liquor, prevention of water pollution and of bush fires, protection of roads and of game, regulation of the cutting of timber, locust extermination, collection of vital statistics, prevention of breaches of the peace, recovery of stolen property, and apprehension of fugitive offenders. Orders made within the terms of the proclamation carry a penalty to be enforced by the native tribunals; the Resident Magistrate is empowered, after consultation with the chief, to suspend the carrying out of any order.

The second proclamation creates tribunals of two classes. The senior tribunal consists of the chief (expressly recognized by warrant for this purpose) and members of his council nominated by

him, their names being duly recorded. The junior tribunals are presided over by a headman appointed by the senior tribunal; the headmen nominate persons to act with them on the junior tribunals. Members of tribunals may be removed by the magistrate after consultation with the chief and the Kgotla. The tribunals decide cases by native law, and inflict punishments allowed by native custom other than those involving death or serious physical injury; corporal punishment may be ordered within specified limits, but the sentence must be reported to the magistrate before it is carried out. Sentences of imprisonment exceeding two months must be reported to the magistrate, who may confirm or nullify them. Records are to be kept of all cases, and examined by the magistrate at least once in every three months. The magistrate, after giving the tribunal opportunity to show cause, may transfer any case to his own court upon the application of a party to the dispute, and may similarly try any case which it was necessary in the interests of peace that he should hear, but he should, except for stated reasons, then determine it under native law. There is a formal right of appeal from a junior to a senior tribunal, and from the latter to the Resident Magistrate.

The proclamations introduced into the Protectorate many elements of the system which has been applied to native institutions in areas under indirect rule. They give greater legal precision to the position of chiefs by laying down a procedure to be followed in their appointment and dismissal, and providing that the deposition of a chief may be effected only by the tribe itself with the government's consent;¹ but the Bechuanaland system differs from the form adopted in most areas under indirect rule in providing that the members of a chief's council must be explicitly nominated, and can be removed by the administration. Elsewhere the constitution of the chief's council has generally been left to the operation of tribal custom; it was held that the conditions in Bechuanaland made a definite appointment necessary; but in practice the administration does not require a full list of members to be submitted. The innovations were accepted by some of the chiefs, but Tshekedi Khama, the regent chief of the Ngwato, and Bathoen, the Ngwaketsi chief, not

¹ *Explanatory Memorandum*, op. cit., pp. 3, 4.

only stated their inability to comply with the terms of the proclamations, but contested their validity in a suit brought in the Special Court.¹ Apart from the technical ground that the proclamations were not covered by the terms of the Order in Council of 1891, it was claimed that they violated rights reserved to the chiefs by treaty, and were void on the ground of uncertainty and unreasonableness. The decision of the court was based on the legal ground that the jurisdiction of the Crown was unfettered and unlimited, and that the other issues raised did not therefore come into consideration. It is, however, clear that behind the suit lay an issue with which the court was itself unable to deal. The two chiefs have consistently urged² that the system of indirect rule conflicts in practice with its proclaimed aims; based on the 'recognition' of a chief which involves the definition of his powers, it constitutes an invasion of his inherent and traditional position as the embodiment of the tribe. The most suitable relationship in African conditions in their view is that of 'parallel' rule; they admit that the final authority must rest with the controlling power, but claim that internal administration should be carried on by the chief. That, however, was the position which the earlier administrators attempted to adopt in Bechuanaland; that it has proved to be impracticable is sometimes attributed to the lack of sympathy or consideration shown in personal relations between the Crown officers and the chiefs; but though some incidents may be quoted which support this view, the general policy of the administration has shown no lack of a desire to support the chiefs' authority. When two authorities with different standards of rule are operating in an undefined field of jurisdiction, it is not possible to avoid conflict, and both Basutoland and Bechuanaland have demonstrated the difficulty of a dualism which attempts at the same time to maintain unimpaired the traditional authority of native chiefs and to achieve a more progressive system of administration. The maintenance of customary native authority is not an end in itself; its justification lies in the extent to which it can be utilized as an instrument for promoting the general welfare. All

¹ *Tshekedi Khama and Another v. The High Commissioner*, see above, p. 405, note 2.

² See Tshekedi Khama, 'Chieftainship under Indirect Rule', *Journal of the Royal African Society*, vol. xxxiv, 1936, pp. 251-61.

experience goes to show that the best guarantee for the maintenance of traditional institutions in modern conditions lies in integrating them with the government institutions necessary to secure good administration; that policy does not necessarily refuse to admit that native authority may have an independent sphere of action, but it must be independence in a defined and regulated field. The alternative is the inevitable disintegration of the basis on which traditional authority itself exists.

VII. TERRITORIES UNDER INDIRECT RULE

The term 'indirect rule' has been applied to various systems of native administration; it is used here to denote the system by which the tutelary power recognizes existing African societies and assists them to adapt themselves to the functions of local government.¹ The characteristic difference between direct and indirect rule lies partly in the theory held as to the place to be assigned to traditional native authorities in administrative and judicial organization, partly in the use which is made of them; but the difference can be better appreciated by a study of the stages through which the present position has been evolved than by a discussion of principle.

The functions which modern colonial administrations have assigned to native authorities have been largely determined by the nature of the organizations which they encountered on entering upon their rule. In India the Indian states for a variety of reasons have never been brought under British administration; they have remained independent, with internal sovereign rights, under the suzerainty of the Crown. If in the areas brought under British administration little use has been made of traditional authorities as such, it was mainly because Great Britain succeeded to a state organization in which such authorities had no place. The Moghul system of rule, largely feudal in form, had a widely extended official organization, and the development of British administration amounted in effect to the progressive substitution of a new administrative and judicial personnel, more systematically regulated and with more clearly defined powers, for that which

¹ M. Perham, 'Some Problems of Indirect Rule in Africa', *Journal of the Royal Society of Arts*, vol. lxxxii, no. 4252, 1934, p. 690.

had previously existed; the task was the easier in that the British government found no difficulty in enlisting the services of qualified Indians whom it could associate in its executive and judicial activities. What would be described in African territories as the traditional native authority had largely disappeared; the social organization followed lines of caste rather than of tribe or clan, and caste had mainly a religious significance. Some observers,¹ whose opinion is entitled to great respect, have thought that greater recognition might have been given to the *panchayats*, or local authorities representing the village units, and that though in some areas the influence of a centralizing system had deprived them of their vitality, there were others in which they might clearly have been used with advantage as institutions of local government. The prevailing policy of the time was, however, in favour of a direct form of administration under the supervision of European officials, and the result was the development of direct official rule, drawing its authority entirely from the state, and extending not only over the general field of executive and judicial administration, but over the numerous activities connected with the improvement of material and social conditions. At a later stage policy was directed to the development of local government institutions, partly as an education in the responsibilities of government, partly in order to relieve the administration of the burden of some of its activities or to allow of their expansion by the aid of local taxation. The municipal and rural boards then created were bodies instituted for the purpose of taking over prescribed functions which the government had previously exercised through its own official organization; in the first instance they were constituted by nomination and given an official chairman, but are now, with few exceptions, developed organs of local self-government on an electoral basis, largely responsible for raising their own resources, and subject only to an external control which is defined by statute. In recent years an effort has been made to revive the *panchayat*, but with varying success; in many areas the village has so far disintegrated that the *panchayat* has no traditional support.

Historical developments gave a different character to the ad-

¹ See references quoted by Sir Donald Cameron in *Principles of Native Administration and their Application*, 1930, pp. 33-4, note.

ministration in the Dutch East Indies. From the outset the Dutch adopted a system of direct rule, save in about one-seventh of Java, where the native chiefs have much the same position as in India. Elsewhere the régime was once described as *le paradis des fonctionnaires*. After 1903, however, they adopted a policy of decentralization, four to six districts being combined under a Regent, usually a descendant of an aristocratic native family, with a council which usually includes two Europeans. Three to five regencies make a Residency under a European officer. The *desa*, the traditional village organization has, however, remained intact and is fully utilized; the village chooses its own headman and his council; he has, as headman, both administrative and judicial powers, and his jurisdiction has been confirmed by regulations which attach legal sanction to his decisions.

In the Federated Malay States the Residential system has left the traditional native authority of chiefs unimpaired in form, though the control exercised over them goes beyond the sphere of political relations and extends to their internal administration. In Indo-China the French have in Tonkin made but little use of native traditional authorities. The fundamental unit of their system of administration is the village, and considerable powers are given to the headman; but the headman and the village council have not the character of customary authorities; the headmen are elected, they are removable, and are paid by a commission on the collection of revenue. Above the headmen there are the usual grades of officials; the hereditary or territorial chiefs have no place in the administration. In Annam and Cambodia the former rulers have been retained, and ordinances are issued in their name; the countersignature of the Resident is, however, required to make them valid, and the chief officers of state are, in effect, heads of departments subordinate to the Resident.

The survey made of the course taken by native administration in South Africa has shown the extent to which use has been made of hereditary chiefs. Natal presents the only instance of a deliberate use of the tribal organization, but as will have been seen, this was not originally a policy of choice, but was adopted owing to the lack of facilities for direct official management. The system accordingly never developed on the lines which it might have taken had the

administration proceeded on a conviction of the inherent value of tribal institutions, and though in recent years more extended use has been made of the services of hereditary chiefs, in particular in a judicial capacity,¹ the trend of policy points to an expansion of the council system rather than to an increased use of customary institutions or tribal organization. The course taken in the High Commission territories and (as will subsequently be seen) in Barotseland² affords an interesting illustration of the difficulty of securing improvements in administration if an effort is made to maintain traditional authorities in substantial possession of their customary position, as an alternative to bringing them under regulation and control; in seeking a solution to this problem, the Crown authorities have in Bechuanaland and Barotseland adopted, though in different forms, a considerable measure of the procedure which characterizes indirect rule elsewhere.

VIII. NIGERIA

In the literature which has grown up on the subject of indirect rule it is usual to regard Nigeria as affording the best material for illustrating its characteristic features;³ and there is an added convenience in doing so, since the publication of Miss Margery Perham's recent work⁴ gives a full history of the development of the system in that territory, and a description of its working in practice. The history of the British occupation of Southern Nigeria, as she has pointed out, was one of reluctant and hesitating penetration;⁵ that of Northern Nigeria had a more definite element of conquest. Circumstances did not afford the Royal Niger Company an opportunity of undertaking administration on any extensive scale, but it is worthy of note that after the conquest of the Bida Emirate Sir George Goldie laid down the principle that the company should as far as possible 'rule indirectly through feudatory princes',⁶ and he clearly had in view the system adopted in India in dealing with the Indian states.

⁵ See D. Wellesley and S. Gwynn, *Sir George Goldie, Founder of Nigeria*, 1934, pp. 25-6.

⁶ S. Vandeleur, *Campaigning on the Upper Nile and Niger*, 1898, p. 239.

'Even an imperfect and tyrannical native African administration, if its extreme excesses were controlled by European supervision, would be, in the early stages, productive of far less discomfort to its subjects than well-intentioned but ill-directed efforts of European magistrates, often young and headstrong, and not invariably gifted with sympathy and introspective powers. If the welfare of the native races is to be considered, if dangerous revolts are to be obviated, the general policy of ruling on African principles through native rulers must be followed for the present.'¹

When Lord Lugard was appointed High Commissioner in 1900 he had experience of the system followed in the Indian States, and of the Buganda Kingdom as well as of Nigeria; already in 1893 he had outlined for Uganda a system under which its internal control should be carried on through the existing chiefs.² He considered that, though in that particular instance the king had proved himself incompetent, nevertheless the Resident could and should rule through the chiefs. In Northern Nigeria Lugard encountered circumstances unusually favourable to the adoption of these principles. In the northern emirates the Fulani conquerors had established organizations which presented many of the features characteristic of the Moslem kingdoms in North Africa and Asia; centralized authority carried on its administration through officers who were in effect fief-holders; there was a revenue system involving a number of taxes, including the *zakkat*, the Moslem tithe on agricultural products, a plantation tax, the *jangali* on cattle, taxes on craftsmen and traders, death duties, tribute, market fees, and tolls on caravan routes. The supreme judicial power lay with the emir and his council, but in practice only issues of grave importance were tried by them, and the ordinary tribunals were presided over by alkalis, trained judges administering the Maliki Code of Moslem law. Their decisions were in the last resort appealable to the emir's court. Although, therefore, there was much in this system which the protectorate government might have to regularize and improve, it was one which could be readily adapted for use. The lack of official personnel no doubt formed an additional argument against any attempt to substitute a direct type of ad-

¹ Sir G. Goldie's Introduction to S. Vandeleur, *Campaigning on the Upper Nile and Niger*, 1898, quoted in D. Wellesley and S. Gwynn, op. cit., pp. 165-81.

² *The Rise of our East African Empire*, 1893, vol. ii, p. 649.

ministration, but even if that had not been the case Lugard had good reasons for applying to the emirates the principles of native administration which he had suggested for Uganda. Though the position at first indicated to his own officers was that of Residents, 'charged rather with political than with strictly administrative functions',¹ he did not in practice leave the emirs in a position of independent rule and subject only to political control. From the first, there was a considerable measure of direct intervention. The Slavery Proclamation of 1900 abolished the legal status of slavery; the fief-holders who had previously lived as courtiers at the emirs' capitals were sent to their districts with the formal position of district heads; the Land Revenue Ordinance of 1904 and a Proclamation of 1906 modified the system of taxation.²

The action at first taken in regard to judicial matters was even more significant. While, as a normal result of the establishment of a protectorate, official courts were set up to deal with non-natives and offences against British ordinances, the law did not, as was done in some territories, assign to these courts jurisdiction over the more serious offences committed by natives; it left full criminal and civil jurisdiction over natives to the emirate courts, but it defined their jurisdiction and brought their proceedings under control. The members of the court were to be 'appointed by the Head Chief or Emir with the approval of the Resident', and the Resident was to have access to their proceedings with power to revise their decisions or transfer cases to his own court.³ In practice this left the bulk of the judicial work in the Moslem provinces in the hands of the emirs' and the alkalis' courts, while in pagan areas the political officers tried what cases they could, leaving the remainder to be decided by the customary processes. Under the Proclamation of 1906, 109 courts were gazetted, and nine were given capital powers subject to confirmation of the sentence by the Governor. In regard to revenues, the sums collected were at first treated as *kurdiñ sarki*, or moneys of the chief, and a share was taken by the government for general revenues; this was at first fixed at a quarter, and subsequently one-half,⁴ save in the case of

¹ *Instructions to Political and other Officers on Subjects chiefly Political and Administrative*, 1906, p. 1.

⁴ See below, pp. 421-2.

the Sultan of Sokoto who, as Sarkin Musulmi, was allowed to retain 75 per cent. of the general tax collected in his emirate. No control was exercised over the expenditure of the emir's share, but the subordinate chiefs, who had previously taken a share of the tribute from their fiefs, now, as district heads, received salaries in proportion to the amount of tax they collected. This measure was significant, as marking the abolition of the previous custom by which they retained as remuneration a part of the money that passed through their hands.

The study of this early stage of native administration in Nigeria is of unusual interest, since it reflects the application of a deliberate policy, put into operation from the first and steadily developed to meet the expanding needs of civilized government. The analogy which first suggested itself in Northern Nigeria was that of the Indian State; but this was clearly inapplicable in practice. As has already been remarked,¹ the treaties or other agreements concluded with the Indian States gave the rulers the status of sovereigns within their own territory; the relation of the Crown to the emir, on the other hand, resembled that of conquest, and as the steps taken in regard to their lands showed,² there was no intention to accord them sovereign rights. It was officially emphasized that their position was to be that of *Wakils* or Governors;³ they were held to have no inherent authority which they could enforce under native law and custom;⁴ nor apparently was it thought that circumstances permitted the practice by which the nominal authority of the ruler is maintained by allowing all orders effecting changes in the administration to be issued in his name; the revision of the system of taxation, for instance, and the reorganization of the tribunals, though they may have represented the result of agreement with the emirs, were effected by proclamation. Formal respect was, however, paid to the position of the emir as head of the native administration; district heads were held to be responsible to him, and orders to them were issued through him; an officer on tour was accompanied by the emir's representative, who was the mouthpiece of the orders communicated to subordinate

¹ See above, p. 413.

⁴ Sir D. Cameron, *The Principles of Native Administration and their Application*, 1934, para. 29.

authorities. If the system adopted in the first stage of native administration in Northern Nigeria is compared with that in force in the High Commission territories, it presents the difference that, while respecting the position of the existing native authorities and making wide use of them, it regulated their powers and defined their jurisdiction. It did not, therefore, admit, as the Crown seemed by implication to admit in the territories, any dualism; there were not two sets of rulers, British and native, working separately or in co-operation, but a single government in which the native chiefs and the British officials¹ had defined positions. The system did not, on the other hand, treat the native authority merely as an agent or mouthpiece of the official administration, as was the tendency in the Union or Kenya; it laid, in effect, the foundation of that system of integrating the native institutions into the official system which is the characteristic feature of indirect rule as it is now understood.

The second stage in the development of native administration in Nigeria coincides roughly with the amalgamation of Northern and Southern Nigeria in 1914. It was marked by two important measures. The procedure of judicial administration adopted in the Northern Provinces was extended to the Southern, a step which had no little significance in the evolution of the system of native administration. The history of judicial administration in the Southern Provinces prior to the amalgamation presents a complicated record, involving a series of adjustments effected as the result of agreements made with different native chiefs. It is sufficient to note here that a system had grown up of which the chief feature was the wide extension of the authority of the Supreme Court; this body had nominal jurisdiction throughout the territory, but since its staff was small the gap was partly filled by appointing administrative officers as Commissioners of the Supreme Court, and by giving wide powers to native courts;² in order, however, to make this measure possible, the native tribunals were presided over by administrative officers who were empowered to appoint any person to act as president on their behalf. They were under the control of the Supreme Court, which heard their appeals, and the result was

¹ F. D. Lugard, *op. cit.*, 1918, p. 298.

² For these courts see below, pp. 431-2.

not merely that the native court lost much of its true character, through the presidency of an administrative officer, but that there was a general tendency towards the adoption of European conceptions of law and procedure. After the amalgamation of 1914, the original jurisdiction of the Supreme Court was restricted to a few centres with a large mixed population; a provincial court, staffed by administrative officers, was given jurisdiction over all other cases, subject to the review of capital sentences by the Chief Justice and an appeal to the Supreme Court in a certain class of civil cases. The native court system was brought into conformity with that of the north; the administrative officer ceased to preside, the criminal powers of the courts were reduced, and their jurisdiction confined to matters of native law and custom. The change was more than one of form. The institution of a provincial court, with an administrative personnel, was designed to regulate justice on lines better suited to African conditions than was possible in courts following strictly the principles of European law and procedure; the native court in its turn tended to assume its true character of a tribunal based on traditional usage, and transacting its business in the manner prescribed by native custom.

In the north it had been an essential element of the system of native administration to entrust the native authority with the disbursement of considerable funds;¹ revenues derived from the general tax had been shared between the emirs and government, and no provision was made for direct control over the expenditure of the emir. In 1910-11 the native administration share of a total internal revenue of £545,000, derived from all sources, was no less than £196,925. The appropriation of so large a proportion of the revenues of the territory to the native authorities was evidence of the spirit in which their position was envisaged; but the very extent of the resources left at their disposal was in itself an argument for introducing measures designed to secure that an adequate part should be spent on public purposes. Certain of the emirs were in the first instance persuaded to accept an allocation of funds on lines which gave them a 'civil list', and the system was progressively extended until the native treasury became a recognized and indeed a fundamental feature in native administration.

¹ See Chap. X, p. 577.

The agreed proportion of the general tax, which represented the consolidation of all previous taxes except that on cattle,¹ was now paid into the treasury; the salary of the ruling chief as well as that of the district heads and the headmen was placed on a fixed basis; the remainder was available for expenditure on public objects by the native authority, subject to the supervision exercised by administrative officers under the terms of the Native Authority Ordinance. The existence of a native treasury became the proof that a native authority had been recognized as a 'native administration'.

The development of indirect rule in the northern emirates involved changes in the practice rather than in the structure of a political organization which had itself no deep-seated roots in tradition. The difficulties it encountered lay for the most part in the adjustment of relations with the emirs themselves; and that they were so readily overcome was a tribute to the officers who evolved the system and to the good sense of the emirs. The pagan areas of the north, however, presented a different problem. In the 1931 census 33 per cent. of the population of Northern Nigeria was classified as pagan. Part of this population had been subjected by the emirs, but there were large groups which had retained their independence. Of the former some communities were not unwilling to accept a continuance of Fulani rule, expressed in the new form of a native authority recognized by government; but the major part resented an alien rule which supplanted their traditional chiefs or village councils by Fulani headmen, and when cases were brought to trial judged them under Moslem law. The emirate native administration was doubtless more efficient than anything the pagan village communities could supply; their organization was weak, and their own customary authorities had been largely suppressed under Fulani rule; but if native administration can achieve vitality only when it is based on the traditional institutions of the people, then its basis clearly ought in this case to be the pagan and not the Fulani institutions. The independent pagan peoples, of which some, like the Tiv, form a large population, presented the difficulty that authority seemed in many cases to reside in leaders of family or kinship

¹ See Chap. X, pp. 577-9.

groups, or even in associations of the nature of secret societies, rather than in any recognizable system of chieftainship. It might, indeed, have seemed that there was no alternative but to apply to them the direct system of administration which has elsewhere been deemed the only solution of a similar situation. With the increase both of staff and of knowledge, however, in recent years great efforts have been made to utilize the pagan institutions as a basis for native administration in the northern areas.

In the Southern Provinces the government had to deal with two diverse sets of political conditions. The Yoruba area contained strong chiefships to which the system of native administration introduced into the emirates was readily applicable. In the south-east, however, the social institutions were of even greater complexity than those of the independent pagans in the north. Here the organization of society has not inaptly been described as atomic;¹ though the characteristic and pivotal group is the collection of a number of extended families, there is a wide diffusion of authority among elders, politico-religious associations, and guilds of title-holders.² An organization of this type, marked by an equalitarian attitude towards the complex of ill-defined authorities through which the community regulated its life, might well have involved a condition of social anarchy; actually it was able to cater adequately for such needs as society presented; but it afforded a baffling problem to those who looked for authorities on whom to base a system of native administration. Moreover, even if suitable authorities could be discovered to exercise the powers which the Native Authority Ordinance provided, the fact that no direct tax had as yet been imposed in the South-Eastern Provinces seemed to render it impossible to institute native treasuries.

In their endeavour to find in the independent pagan areas of the Northern Provinces and in the South-Eastern Provinces suitable authorities for use as agents of the administration, local officers had in the first instance given recognition to a variety of 'chiefs' or headmen who appeared to possess local influence, or to persons selected as 'warrant chiefs', who were authorized to exercise jurisdiction under the Native Courts Ordinance. The potential efficacy of a 'selected' or 'created' native authority,

¹ M. Perham, *op. cit.*, 1927, p. 223.

² *Ibid.*, p. 227.

drawing its support from powers conferred by the administration, as compared with an authority enjoying an inherent influence based on tradition, is one of the most debated issues of native administration;¹ in Nigeria the growing sentiment in favour of the use of traditional authorities is based on the success attained in their usage in Northern Nigeria and the Yoruba Provinces and on experience of the deficiencies of the system of 'warrant chiefs' in the South-Eastern Provinces. This area, strongly democratic in the special African sense, proved to be a peculiarly unfavourable field for the use of placemen of this type, and their failure, which was admitted in the administrative inquiries made in 1922 and 1923,² was emphasized by the incidents which took place in the course of the riots attending the introduction of taxation in 1929.³ The system clearly needed revision; and, commencing in 1926, a comprehensive series of investigations was undertaken partly by the government anthropologist, Dr. Meek, and partly by administrative officers,⁴ with a view to determining the nature of the social groupings and the traditional distribution of judicial and executive functions.

As a result, an effort has been made to constitute the native authorities on a basis which will secure for them such measure of support as societies so lacking in the elements of political organization can be expected to yield. In summarizing the form which reorganization has taken it must be realized that it is not yet complete, and that in some cases it has only a tentative character. In general there has been a drastic diminution in the area and population of the units of native administration. In some cases it has been possible to substitute for the previous chief or headman, who exercised executive authority by virtue of the judicial powers arbitrarily conferred on him, one whom further inquiry has shown to have a traditional claim to leadership. The general course, however, has been to group together villages having a common ancestry into clan or group areas served by clan or group councils, to which every village within the organization

¹ See below, p. 529.

² *Report on the Eastern Provinces by the Secretary for Native Affairs, 1922; Report on a Tour in the Eastern Provinces by the Assistant Secretary for Native Affairs, 1923.*

⁴ See Chap. II, p. 47.

sends representatives, the manner of representation being left to the villages themselves to decide. The clan or group council is gazetted as the native authority under the Native Authority Ordinance, and in some cases the component group or village councils have been gazetted as native authorities subordinate to the clan or group authority. As regards the judicial system, procedure has followed the same lines; where the traditional chief has been recognized as exercising judicial as well as executive authority he has also been given a judicial position as president of the native court. In areas where no single judicial authority existed, clan or group courts have been established comprising either family heads or such representatives as village custom provides, the personnel of the courts being usually, but not always, identical with that of the native authorities. In several districts the clan or group courts have been constituted Courts of Appeal for the group or village courts below, with which they exercise concurrent original jurisdiction; elsewhere they have been left with independent powers. A few courts have presidents recognized in their commission; in others presidents are selected for each sitting; there are some again which appear able to dispense with a president. Many of the new native authorities have been given their own separate treasuries and administer their own finances: others share a common treasury with neighbouring village groups, separate subsidiary estimates being compiled for each unit and the custody of the funds remaining, as a rule, with the District Officer.

The reorganization will be subject to further changes before it takes a final character. The mere number of new authorities created in some areas is itself a formidable difficulty; in one province alone there has been an increase from 52 to 250; and there is an added difficulty in the fact that many of the clan or village groups have no executive head. The initial result of the reorganization has been to stimulate an almost competitive assertion of group consciousness; it is clear that, if the large number of minor authorities now recognized are to develop into effective organs of local government, consolidation or federation must take place, and there are already some indications that, when once the spirit of group consciousness has been satisfied, the process of consolidation need not present grave difficulties.

Meanwhile it can be claimed for the reorganization that it has aroused a growing interest in the development of local improvements, such as education and medical facilities. The most striking evidence of its success is to be found in the growing ease with which tax-collection is being effected in the areas which were responsible for the disturbances of 1929, an improvement which is no doubt largely due to the visible proof offered by the native treasury system that a substantial part of the tax is devoted to local needs.

There are now in the Northern Provinces 86 chiefs and 130 councils, including chiefs in council, as native authorities, with 41 and 451 native authorities subordinate to them respectively. In Southern Nigeria at the end of 1937 there were recognized as native authorities 29 chiefs, 139 chiefs in council, 360 clan and group councils, some with numerous subordinate native authorities, 150 village councils, and 29 native courts. Native courts are gazetted as native authorities as a temporary expedient pending the reorganization of the area on a clan or group basis.¹ In 1936 there were in the Northern Province 63 native treasuries. In 1928 37 of these were given 70 per cent. of the proceeds of native taxation; in the depression year 1933-4, however, the government reduced the percentage, and 1 received 65 per cent., 26 received 60 per cent., and all the remaining treasuries received 50 per cent. of the tax.

The extent of the activity in which this system allows a native authority to engage may be illustrated from the example of the Kano Emirate, the most important of the northern native administrations, which covers an area of 13,000 square miles, and contains a population of about 2,000,000 people. It had in 1936-7 an estimated revenue of £206,720, of which £173,600 came from its share of the tax collected in its area, and the remainder from various fees and dues. The estimated ordinary expenditure for the year was £199,367; administrative and judicial establishments accounted for £70,675, included in this sum being £6,000 as the salary of the emir with £2,500 as his establishment allowance; police and prisons £19,089; works and works staff £61,416; education £6,785; survey £6,468; medical and sanitary £15,922; agriculture and forestry £9,113; and capital works £6,020.

¹ *Gazette Extraordinary* no. 85, Dec. 29, 1937.

In addition, 'special expenditure' from accumulated balances amounted to £57,537. The treasury on March 21, 1935, had an invested reserve of £142,914. The native administration has installed a water-supply and electric-light installation in Kano city, has a large and well-equipped hospital, a middle and ten elementary schools, a survey establishment,¹ and is responsible for the construction and maintenance of all communications in its area. It maintains a large central prison and its own police force. The budget is prepared by the treasury officials, but requires the approval of government; subject to the Resident's concurrence, re-allotment may be made between sanctioned budget heads up to a limit prescribed by the financial rules made by government. The native administration had in its employ eight Europeans on its Public Works establishment, also one medical officer, two sanitary superintendents, and one stockman; the remainder of the establishment, including that employed in the treasury and the survey department, is African. The electrical and water undertakings, which used to be run by the native administration with its staff of European engineers, have since come under the government Public Works Department, the native administration being represented on the board of management. The emir presides over an executive council of four of his chief officials, and the council has a weekly meeting with the Resident of Kano—a procedure which, it may be observed, is followed also in the case of other large native administrations.

No other native authority in the Northern Provinces approaches the exceptional position of Kano. The nearest are Sokoto with an estimated revenue in 1936-7 of £95,350, Katsina with £75,662, and Bornu with £58,601; at the other end of the list are four administrations with an income of less than £1,000, the lowest being Ilo with £635. Of the total expenditure of native administrations estimated in 1936-7 at £973,468, the larger proportion, amounting to 57 per cent., is accounted for under the head 'administration', which includes the salaries of chiefs and the executive and judicial establishment, 23.2 per cent. by public works, 6 per cent. by health, 5.5 per cent. by education, and 6.3 per cent. by agricultural and other services.

¹ See Chap. XII, p. 853.

In the Southern Provinces the percentages of tax allowed to native administrations have recently been reviewed, and where it was shown that individual native authorities were willing and able to undertake public services for which their existing revenues were inadequate, they have been granted an increased share of tax. There were, at the beginning of 1938, 114 native treasuries, of which 10 receive 70 per cent., 47 receive 60 per cent., 12 receive 55 per cent., and the remainder 50 per cent., of the direct taxes. The most wealthy of the treasuries are Ibadan and Egba (Abeokuta) with annual revenues exceeding £83,000 and £68,000 respectively, the next largest being Ijebu, Oyo, and Benin with annual revenues exceeding £50,000, £27,000, and £25,000 respectively. As compared with the Northern Provinces there is a far larger number of small treasuries, 23 having an estimated income (1938-9) of less than £1,000 and 3 having only £156. There is, as might be expected, a corresponding difference in the scale of activities undertaken: only 7 of the native administrations have their own prisons; only the larger administrations can undertake medical or educational work on any serious scale; the estimates for 1938-9 show that, of the total native administration expenditure amounting to £677,034, 60 per cent. is spent on administration, 28 per cent. on public works, and 11·8 per cent. on education and health services.

The native treasury is regarded in Nigeria as an essential feature of the system of native administration.¹ The treasury not only keeps alive the tradition under which the native authority held the proceeds of tribute or services in trust on behalf of the community; the power of disbursement provides a training in responsibility, and establishes a close contact between the native authority and those on whose behalf expenditure is incurred. Historical and economic features have permitted some of the native administrations in Nigeria to exhibit an activity in local government far more spectacular than in other territories under indirect rule. The extent of the allocation of general revenues made in their favour has indeed created certain problems as to the place occupied by native administrations in the general development of the territory, which do not occur in a similar form elsewhere. Where,

¹ *Report by the Rt. Hon. W. G. A. Ormsby-Gore on his Visit to West Africa*, Cmd. 2744, 1929, p. 116.

as in India, institutions for local self-government have been created by devolution of functions from a central authority, it has been possible to maintain some uniformity of treatment in different areas, by adjusting the extent of the responsibilities of the local body in proportion to the sources of revenue devolved; the system followed in Nigeria, by which a large part of the general tax automatically passes to the native authority, produces a marked inequality in the opportunities for development enjoyed by different areas. The services which can be provided, for instance, by Kano differ widely from those available to a poorer neighbour, and the disparity can only be adjusted by the central government's undertaking, at the expense of general revenues, the activities which the poorer administrations cannot afford. A further difficulty arises as to the relative spheres of activity of the central departments and of the administrative officers in charge of the native administrations; a general programme for dealing with epidemic disease may become dependent on the concurrence of a large number of authorities regulating native administration finance. An assistant director of public works, whose duties now include that of superintendent of native administration works, has been appointed for the Northern Provinces, and instructions have been issued to regulate the relations of departmental and administrative officers;¹ but the fundamental difficulty, arising from the ambiguous position as between the central government and the native administrations, which is increased by the present system of allocation of revenues to the latter, still remains for solution, and is receiving government's close attention.

In addition to the general obligation to assist in maintaining order and preventing crime, for which purpose a native authority has powers of arrest, an authority may issue executive orders² on a variety of matters including the manufacture and use of liquor, the carrying of weapons, the safeguarding of water sources, contagious disease, the migration of natives from and to its area, measures for dealing with tsetse fly, the compulsory cultivation of subsistence crops, and matters which by any native law or custom the authority has power to regulate; the breach of such orders can be punished in a native tribunal by fine or imprisonment up to six months. Native authority orders are frequent and

¹ *Gazette* no. 62, Dec. 22, 1932.

² Orders, not Rules, is the Nigerian term.

relate to such matters as sanitation and markets or township regulations where Township Ordinances do not apply. In the Northern Provinces and in Oyo cattle-control orders emanate from the native authority; in Ibadan the authority makes orders regarding the transfer of land.¹ The orders issued may be revoked by the Resident, who may also direct the authority to issue orders which he considers to be necessary, and, failing compliance, issue them himself. The government has accordingly the power to bring its own ordinances, such as those relating to health, sanitation, animal pests, and the like, within the scope of the functions of the native administration, and in consequence within the jurisdiction of the native tribunals. In Benin the native authority administers the whole of the Forest Ordinance, but it is more usual for the authorities to make simple orders which make the application of ordinances such as the Public Health Ordinance unnecessary.

Native authorities may also, subject to the approval of the Governor, make rules providing for the welfare of persons within their jurisdiction, including rules regarding the public services which they provide and the imposition of rates. One object of this power of subsidiary legislation was to enable native customary laws to be placed on record, and to allow for their development and expansion to meet changing needs.² The native authorities' rules have, however, been used more to give directions as to local observance than to modify native custom, as the courts themselves modify custom when it becomes necessary to do so. Rules are not always gazetted.

The Native Authority Ordinance³ leaves a wide latitude as to the use which the native administrations, differing widely in their constitution and the extent of their resources, may make of their powers. Methods have been prescribed for the institution of treasuries, the preparation and supervision of budgets, the auditing of accounts, and the like. The measure of control exercised by officers of the administration varies; it has been shown that, in the case of the major native administrations, the Resident meets the chief and his council

¹ See Chap. XII, p. 854.

² Sir D. Cameron, *op. cit.*, 1934, para. 41. See Chap. VII, p. 308.

³ No. 43 of 1933.

weekly, and that the annual budget has to be submitted for the approval of government; in the administrations at the lower end of the scale the control becomes closer, and in the smallest every item of expenditure requires an officer's counter-signature.

The native court is so essential to native administration as practised in Nigeria, that it will be convenient to add here some details of these tribunals. They are true native courts in the sense that, save in the exceptional case mentioned below, administrative officers do not take part in their proceedings. Under the Native Courts Ordinance¹ courts recognized by government may consist of one or more chiefs or other persons, or a combination of these, according to the provision made in the warrant. They are classified in four grades, described as A, B, C, and D, and certain courts may be appointed native courts of appeal. No native court has jurisdiction in cases of treason, sedition, corruption by government servants, offences against public revenues, or trial by ordeal; with these exceptions the A courts or higher grade have complete criminal jurisdiction over natives within their areas. In 1933 seventeen such courts were scheduled. The limited A court, of which there were twenty, has jurisdiction over all cases save those of homicide; the B, C, and D courts have powers which are proportionately limited, the D court, for instance, having criminal powers only in cases which can be adequately punished by imprisonment up to three months, or, in the case of theft of farm produce, up to six months. The courts administer native law and custom, orders or rules passed by native authorities, and the provision of any government ordinance which they may be specially authorized to enforce, as for instance the Native Revenue Ordinance. Sentences of death are subject to confirmation by the Governor; corporal punishment can be inflicted up to the limit prescribed by law, but its execution must await confirmation either by the emir, if imposed by an A grade court, or by the district officer, if imposed by any other court. It is specially provided that the district officer may sit as adviser in any court and as president in courts prescribed by the governor when suits regarding land are being heard. The Resident and district officer have access to the proceedings of all courts, and may review any of their decisions, or transfer the case

¹ No. 44 of 1933.

to their own or any other court. The provisions regarding appeal are dealt with elsewhere;¹ but it may be noted that the aim is to constitute a self-contained system of native courts by providing, whenever possible, Native Courts of Appeal which hear appeals from a court of first instance. When the latter is an A court, the appeal generally lies direct to the High Court, and where no Native Court of Appeal exists, then to the magistrate's or district officer's court. But there is no appeal beyond the native court system, unless the warrant expressly so provides, in matters relating to marriage, family status, inheritance, or guardianship of children; these matters are considered to be peculiarly within the knowledge of native courts, and cover the majority of cases in most areas. In such matters redress can be obtained by way of review by administrative officers.

How far the system can be said to have changed in character in the course of its evolution is perhaps a question mainly of historical interest. Sir Donald Cameron's Memorandum of 1934 reasserts in substance the principles formulated in the *Political Memoranda* in which Lord Lugard embodied his views of native administration. If the Memorandum of 1934 differs from the earlier *Memoranda* it is mainly in the emphasis it lays on certain principles selected as underlying the application of the system. It² insists that, if the native authorities are to become not only a part of the machinery of government but a living part of it, the political energies and ability of the people must be directed to the preservation and development of their own institutions; the native authority selected for recognition by government must therefore be that which according to tribal tradition and usage has in the past regulated the affairs of each unit of native society; it is equally important that it should be that which the people of to-day are willing to recognize and obey. But the objective is not merely the utilization of native authorities as instruments of local government; native administration is conceived as a means of trying 'to graft our higher civilization upon the soundly rooted native stock . . . moulding it and establishing it into lines consonant with modern ideas and higher standards'. This view of the objective of native administration, or of the

¹ See Chap. VII, p. 285.

² Paras. 9 and 12.

methods implicit in its formulation, may not differ in any material sense from that of the earlier *Political Memoranda*; but it expresses a conception of the doctrine underlying the system of indirect rule which brings it into pronounced contrast with systems that seek to effect the improvement of native conditions by the direct activity of government establishments¹ or the adaptation of institutions framed on a European model.

IX. BRITISH CAMEROONS

The system of native administration in the Cameroons under British mandate follows that of the neighbouring districts of Nigeria; in effect, the territory falls into two sections, corresponding to the Northern and the South-Eastern provinces of Nigeria. The social institutions of the people have been carefully surveyed, with a view to discovering the traditional seat of authority.² The organization of native administration in the light of this inquiry has resulted in the recognition under the Nigerian Ordinances of 1933, which have been extended to the Cameroons, of native authorities of various types. In the coast area of Victoria District the district head is an educated man, and head of one clan, whose authority extends over a heterogeneous population and does not rest upon native tradition; the Bakweri and Balong native authorities, also in the Victoria Division, are, on the other hand, based upon indigenous institutions, and consist of village heads with councils of elders, which send representatives to a clan council under the chairmanship of the district head. In parts of the Kumba Division the recognized native authorities are the representative of small kindred groups which do not acknowledge a superior authority; in the Bamenda and Mamfe Divisions there are sometimes chiefs with councils, and in other areas the authority is the native court, consisting of representatives of the villages. In part of the Adamawa Districts, which the Lamido, the Fulani ruler, formerly controlled through hereditary fief-holders, it has been necessary to retain the system of district heads, though they are not hereditary leaders, since the pagan tribes are not yet able

¹ For problems arising out of the relations between government departments and native administrations see Sir H. Clifford's Minute, *Gazette* no. 13, Mar. 2, 1926; Sir D. Cameron, *op. cit.*, 1934, paras. 17, 26-9.

² See Chap. II, p. 47, and above, p. 424.

to provide leaders of their own. In the Kentu areas, which are still in process of organization, chiefs and elders function as native authorities and courts. In Dikwa the standing of the Shehu closely resembles that of the emirs of Northern Nigeria;¹ the Dikwa and Bornu ruling houses have indeed a common history. The Shehu is the native authority and controls the areas under his jurisdiction through district heads whom he appoints. He maintains his own police and his own prison.

The larger native authorities have their own treasuries; the smaller have in some cases been associated with central treasuries. The Adamawa Districts in the mandated territory are treated as part of the Adamawa Emirate, which has its treasury at Yola in Nigeria; the Kentu area administrations are affiliated with those of Wakuri, Takum, and Donga in Nigeria; but sub-accounts are kept in order that the local areas should have the benefit of revenues collected in them, an arrangement which is of some interest in view of the prescriptions of the mandate. The proportion of the general tax allocated to the native treasuries is 70 per cent. in Mamfe, Bamenda, and Balony, 65 per cent. in Dikwa, 60 per cent. in Kentu, Adamawa, Victoria, Bakweri, and Kumber, and 50 per cent. elsewhere. For 1935-6 the total revenue of the ten treasuries was £43,494, the smallest having a revenue of only £245. The chief items of expenditure are on establishment and works of various kinds; the contribution to medical and educational activity is relatively small. The Shehu of Dikwa receives a salary of 14 per cent. of the tax, a relatively large amount which reflects the exceptional position occupied by him, and it is not intended that his successor should receive a similar treatment. In most of the native administrations the salaries paid to chiefs are small.

X. TANGANYIKA TERRITORY

Tanganyika affords a close analogy to Nigeria. It may be said to owe the form of its native administration to Sir Donald Cameron, who before he became Governor of the territory in 1925 had previously spent sixteen years in Nigeria, and the latter country in its turn received the benefit of Sir Donald's experience of the

¹ See above, pp. 417-20.

development of the system in Tanganyika when he returned to Lagos as Governor in 1931. In the course of the rule of their East African Protectorate the Germans had found in Ruanda-Urundi and Bukoba the type of organization which they felt able to recognize; they appointed Residents to these three areas, who carried on the administration through the local 'sultans'. The coastal regions and the south, where not only was the tribal organization weaker, but military and other considerations led them to adopt a policy of curtailing the powers of local chiefs, were divided into seventeen civil districts under district officers who carried on their administration through subordinate officials, the akidas and jumbes, a system developed from that introduced by the Sultan of Zanzibar. The akidas were for the most part of Arab or Swahili extraction, and received a special training for their work; the jumbes, or village headmen, were appointed by the administration, and given judicial powers subordinate to those of the akidas. An objective study of the German system of administration has yet to be written, and much of the available evidence of its character is coloured by the prejudices of the war period. As regards the merits of the akidas, there is some conflict of opinion among those who had the opportunity of observing the German administration; to some they gave the impression of an efficient subordinate service, though hampered in their judicial functions by the fact that they were acquainted only with Moslem law; others have described them as overbearing and corrupt. Had the system been consistently pursued for a sufficient period and in conditions (such as those now generally prevailing) in which administration takes a wider scope than the rudimentary purposes which it then served, it might have furnished an interesting experiment in the use of a trained African agency in regulating native affairs. It is of interest to note, however, that Dr. Solf, as Minister of the Colonies, determined about 1913 to introduce into the native administration of the German Cameroons some of the features of indirect rule as practised in Northern Nigeria.

The British authorities adopted at the outset the system which they found in force, but as early as 1922 the Governor, Sir Horace Byatt, announced his intention to adopt a form of indirect administration, and in 1923 a Native Authority Ordinance was issued

to confer on administrative officers, native chiefs, and headmen the authority to issue rules for the maintenance of order and the prevention of crime. In practice no systematic use was made of native authorities until the enactment by Sir Donald Cameron of the Native Authority Ordinance of 1926, the principles of which had been explained by him in a Circular of July 1925.¹ In most essential points the circular took the same ground as the subsequent Nigerian Memorandum on the *Principles of Native Administration* to which reference has previously been made;² but in issuing it in a revised form in 1930 the Governor took the opportunity further to emphasize the value of a system of indirect administration as a method by which the government could give effect to its obligations under the mandate. He pointed out that Article 22 of the Covenant implied that the guardianship or tutelage created should continue only until the peoples concerned were 'able to stand by themselves', and whatever the precise political objective which this involved, it could not mean merely the attainment of responsible government by the European section of the population; it clearly required that the mandatory should make such dispositions that, when the time came, a full place in the political structure should be found for the native population. The method of indirect administration appeared, in his opinion, to be the best way to meet this requirement; it would serve to keep native society together and to give it some training, however simple, in public affairs.

In introducing this change the government was in some measure influenced also by considerations connected with the raising of the native tax, which was found necessary in 1922.³ Some difficulty was experienced through the fact that tribesmen, in addition to payment of the government tax, also rendered to chiefs an annual tribute either in kind or service. This tribute, which by custom was held in trust for communal purposes, had tended with the growth of economic conditions to become a source of personal profit, and irregular exactions were frequently made. The issue of the Ordinance of 1926 permitted of the institution of native administration treasuries, and the opportunity was taken to assess

¹ No. 50, issued in revised form as *Native Administration Memoranda*, no. 1, 1930.

² See above, p. 432.

³ See Chap. X, p. 567.

the value of the privileges of the chiefs, the amount at which they were assessed being added to the hut and poll-tax and paid into the treasuries, in order to form a civil list from which chiefs could be paid salaries proportionate to their status and the wealth of the unit as expressed by the amount of tax which it paid. Tribute and services to chiefs were as a result abolished. The assessment of the compensation due to chiefs led to considerable diversity in the rate of remuneration paid to them; the amount was largest where the tribal system survived in its strongest form, it being estimated that one chief enjoyed the disposal of tribute worth not less than £10,000 annually; in other cases the amount was negligible.¹ There are in Tanganyika no native administrations of the size and importance of those to which reference has been made in treating of Nigeria; the highest salaries paid to Tanganyika chiefs are perhaps to be found in Bukoba, where one chief receives £2,187 with a commutation allowance of £673; another receives £1,600 plus a commutation allowance of £440, another £1,220. These are, however, exceptional cases, and adjustments are being made as offices fall vacant; the general range of salaries is on a much more moderate scale; there are some chiefs who receive only £30 a year.

The organization of the native authority system constituted by the ordinance is elastic, and adaptable to a variety of circumstances. There are four classes of such authorities. The first is the Chief Native Authority, the so-called paramount chief; he usually has subordinate chiefs under him, who are gazetted as subordinate to the Chief Native Authority; but the native treasury is that of the major unit. Secondly, certain federations of chiefs are recognized as native authorities; each chief is the authority in his own unit, and retains independent executive powers; but the members of the federation combine for certain purposes, principally to constitute a joint treasury, and for the passing of 'rules' applicable throughout the federation. In most of the native administrations of this class the president of the federal council is chosen in rotation, but in some a permanent president has been appointed by the chiefs themselves. The third class of native administration is the tribal council, consisting of petty chiefs or

¹ *Proceedings of the Legislative Council, First Session, 1926-7*, pp. 33-5.

headmen, belonging to the same tribe; they sit as chairman of the council in rotation, and have a common treasury. Fourthly, there is the small chief or village headman of a more or less isolated portion of a tribe in areas which recognize no wider political authority; each, if recognized, is appointed a native authority with limited powers and a small treasury. These latter authorities correspond to the clan or village council in Nigeria.¹ It will be understood that, as in Nigeria, the chief or headman obtains that position by the customary usage of his community, whether it be hereditary or by selection, and the administration intervenes mainly in order to settle disputes as to succession. He acquires the constitutional position of native authority only when he is recognized by the administration as such; and it is implied that, in acting in this capacity, he maintains the customs of his community in respect of consultation with his council. The membership of the council is not prescribed by the administration; it is regulated by local custom. In the first year after the issue of the ordinance five native administrations were gazetted; there followed in the subsequent years a process of investigation and inquiry, with the object of ascertaining the traditional sources of authority and drawing the boundaries of their jurisdiction. At first a tendency was shown to form centralized political units through the creation of paramount chiefs, but appointments of this nature, where they lacked the support of traditional usage, were not successful, and later policy has sought to find a more suitable unit for executive and judicial purposes in a gradual process of amalgamation. That process still continues.

Difficulties have been encountered in the coastal areas, in some districts owing to the existence of aggregations of people of different tribes and customs in one locality, in others to the general breakdown of tribal organization. Dar-es-Salaam district was directly administered up to 1930; in that year an investigation into the social constitution of the inhabitants resulted in the recognition of the village community as the administrative unit. Headmen (Ndewas), chosen by the villagers themselves, were appointed as executive authorities. The system appears to have met with little success, and in some cases the government has had to take over the

¹ See above, pp. 424-5.

work of collecting tax. In other coastal areas it has been remarked that native authorities are ineffective without the continuous support of the district administration; and that they have not the authority of the *akidas* of the past. In parts of the Lindi and Mikindani Districts it has been necessary to create a number of posts of 'superior native authority' with executive powers extending over areas larger than those covered by the traditional authorities previously recognized; these are members of the tribes concerned and chosen by them. It may be premature to conclude that a system of indirect administration is unsuited to such communities; but it would also be inadvisable to allow convictions based on the success of this system in other conditions to rule out the possibility that an experiment in a more direct method of administration might justify itself in these areas. It is noteworthy that in 1934 it was found necessary to place an Arab *liwali*, who is *ex officio* a native subordinate court magistrate, in charge of the mixed native community at Ujiji on the shores of Lake Tanganyika, and he was in 1935 appointed President of the Luichi federation, the native authority which has jurisdiction over this area. The Masai have presented a difficulty of a different character; their own organization has not broken down, but it is one which recognizes no individuals as entitled to exercise the powers usually conferred on a native authority. Discussion with the tribe led to an agreement that the headmen were not expected to act as individuals but as a council; the Laibon, a religious head, being expected to delegate any duties not of a hereditary character to chosen members of his council. A system of administrative arbitration and debate by local councils was accordingly approved; but though the machinery of indirect rule has thus been provided, it cannot as yet be said to function.

Amalgamation and federation have led to a reduction in the number of native treasuries, which at the end of 1937 numbered 77 in all. Their resources consist of the 'rebate' on the house and poll-tax collected in their area, native court fees, and local dues, such as ferry and market fees. The 'rebate' was at the outset fixed at 10 per cent., but has been gradually raised, and now ranges from 20 to 33 per cent. Of the total house and poll-tax of £632,330 collected in 1935, the native authorities received £145,324 as

'rebate', and with the addition of local receipts their total revenue for 1935 amounted to £186,723; the accumulated balance from previous years carried forward to 1936 was £143,639. It is inevitable that in the circumstances the 'tribal administration' charges, including salaries of chiefs and other establishment charges, should constitute the largest item in their budget, amounting in 1935 to 68.1 per cent. of their total expenditure. In some cases, as for instance Bukoba, the expenditure on chiefs' salaries is clearly disproportionate; in 1934, out of a total revenue of £23,425, the salaries of the Bukoba chiefs, their deputies, and the sub-chiefs absorbed £11,700, and those of headmen £1,399, or 55.9 per cent. of the annual revenue. As regards other classes of expenditure incurred by the native authorities in 1935, 9.6 per cent. was charged to health, 4.2 per cent. to education, 6.4 per cent. to agriculture and veterinary services, and 5.3 per cent. to roads and bridges.

The ordinance¹ which lays down the jurisdiction and duties of the native authorities closely resembles that of Nigeria; the special circumstances of Tanganyika account for the fact that their powers are here specifically held to include the engagement of labour for public works, the provision of food for travellers, and the execution of measures to prevent famine. The absence of large political organizations such as exist in some areas of Nigeria, and the relative lack of experience among the chiefs, have necessitated a stricter measure of control over the working of native administrations; with one or two exceptions, there are few administrations which are yet capable of maintaining their own treasury accounts in as complete a form as some of the Nigerian treasuries, and in some cases these are kept at the district headquarters.² On the other hand, there would appear to be a more extended use made of the native authorities as agencies of the administration in the discharge of a number of its social activities. Of this there are many evidences; typical cases will be found in the extensive use of native authorities in the campaign against tsetse-fly and the resettlement of cleared areas, and in the passing of native authority rules to establish and control markets for

¹ *Laws*, cap. 47.

² For the organization of tax-collection see Chap. X, pp. 567-70.

native produce,¹ to combat soil erosion by contour ridging,² to control coffee cultivation,³ to prohibit the sale of foodstuffs for export in periods of local scarcity, to promote afforestation, to close areas to stock grazing, and to regulate attendance at school.⁴ In all such cases, breach of the order or rule is triable by the native tribunal. In some instances such rules or orders may be due to the initiative of the native authorities; for the most part, however, they may be said to be the result of advice given by administrative officers and, as will have been seen, they extend beyond the range of matters which would normally have been regulated by native authorities under their own customs; the native authority has become a recognized agency in assisting the operations of the central departments. It would also appear that native authorities in Tanganyika have made a wide use of section 15 of the ordinance⁵ which allows them to use their rule-making power for defining or modifying local customary law. Thus, native authorities have in different areas passed rules for the registration of marriages, for limiting dowry, for regulating testament by will and succession to holdings, for abolishing claims for the return of cattle in dowry suits, for creating rights of ownership in coffee-trees, and for modifying the tribal custom governing damages in adultery suits. Reference is made elsewhere to the rules made by the native authority in Bukoba in defining the special nyarubanja tenure and registering transfers.⁶

The native court is now organized on the same principle as in Nigeria.⁷ The system established by the Courts Ordinance of 1920 made the native courts subordinate to the High Court, though they remained under the supervision of political officers. In theory this had the result of making the native court part of the system of European justice; that it did not do so in practice was due to the fact that the limits of the two spheres of supervision were ill defined,⁸ and that effective control of the native court actually

⁸ *Proceedings of the Legislative Council*, April 3, 1929, p. 26.

stopped with the administrative officer. The enactment of the Native Authority Ordinance of 1926 necessitated a reconsideration of the place assigned to the native court, not merely because the ordinance was the outcome of a policy which attached a new importance to the position of traditional institutions, but because the native court now became the tribunal for trying cases arising out of the orders and rules issued by the native authorities. The Native Courts Ordinance of 1929 had for its object the institution of a self-contained system of native courts under administrative supervision; it removed the courts from the control of the Supreme Court, and made the executive authorities the sole avenue of appeal. There is nowhere any separation of judicial and executive personnel, as in the alkali courts of Nigeria. The court is identical with the executive authority, and is constituted 'in accordance with native law and custom'; thus, though the warrant is in the name of the chief, the membership of the court is not prescribed by the administration, and custom regulates the manner in which a council or elders are associated in the trial of cases. There are two grades of court, but the jurisdiction of each particular court is separately defined in its warrant; in typical instances, the first grade has powers in civil cases where not more than 600s. is involved, and criminal powers over offences not punishable with more than six months' imprisonment or a fine of 200s. or 8 strokes; these courts also in many cases hear appeals from courts of the second class. Certain traditional chiefs' courts belonging to the first grade have, owing to pressure of business, delegated minor jurisdiction to new courts of the second grade under sub-chiefs. These new courts, notwithstanding the absence of traditional authority, appear to command popular respect and to work efficiently. The second-class courts have civil jurisdiction up to a subject-matter of 200s., and in criminal cases are limited to a punishment of one month, a fine of 50s., and 6 strokes. The range of powers entrusted to the native courts is therefore substantially lower than in Nigeria. There are the same provisions for inspection of proceedings and revision of decisions by administrative officers; sentences of corporal punishment cannot be carried out until confirmed by them;¹ and it may be

¹ The Native Courts (Corporal Punishment) Regulations, 1929.

further noted that there are in Tanganyika no native administration prisons. All fees and fines are paid into the native treasury account.

The organization of native administration on both its executive and its judicial side has deliberately been kept in a flexible form, and its structure has not yet taken a final shape. There has been a progressive integration of the traditional native institutions into the general administrative system, as is shown by the growing use of rules and orders issued by the native authorities to secure the purposes of government. At the present stage of development there is not unnaturally a marked inequality in the efficiency of different native authorities, and the character of the native administrations as a whole may be said to depend largely on the extent of the supervision exercised. There are many evidences of the growth of a sense of initiative and responsibility, but on the experience so far gained it would be premature to attempt an estimate of the capacity of the present institutions to develop into autonomous organs of local government. Nor is it as yet easy to estimate the extent to which the system of native administration, still in an experimental stage, has provided a training that will fit natives to take their place in the political life of their country. It was anticipated in the Memorandum of 1930 that there might eventually be a central non-native and a central native council, delegates from each sitting to discharge most of the business now conducted in the legislative council. So far, no steps have been taken to introduce any form of political organization which would prepare for a development of this nature. There have been conferences of native authorities for the discussion of common problems, such as those of the fifty-two chiefs of the four Sukuma districts of the Lake Province, and such meetings may contain the embryo of further political organizations; they are, however, at present only assemblies convened for informal consultation and discussion.

XI. UGANDA

In Uganda the development of native authorities as agencies of local government began earlier and, in some respects, is more complete than in Nigeria or Tanganyika; this peculiar position in

native administration was due largely to the circumstances leading up to the Agreement of 1900.¹ The Buganda kingdom was a developed political organization. Under the Kabaka a native parliament, the Lukiko, was responsible for legislation, and was at the same time the final judicial authority. The Kabaka exercised authority through great chiefs who had jurisdiction over divisions or 'counties', with district chiefs subordinate to them, the whole forming an official hierarchy, superimposed on the original clan organization, and directly responsible to the central executive. The head of the administration and judiciary was the king's chief minister; the king himself, while regarded as the source of authority, took little part in actual administration. The Agreement maintained the essential features of this organization, and permitted of a substantial measure of local autonomy. It recognized the Kabaka as the 'native ruler of the Province of Uganda under Her Majesty's protection and overrule'; it was, however, lacking in precision in its reference to the measure of legislative and judicial authority which his government would enjoy. Article 5 provided that the laws of the protectorate were to be equally applicable to the kingdom of Buganda, 'except in so far as they may in any particular conflict with the terms of this Agreement'. The condition of repugnancy was not easily applied in practice, and at one stage the protectorate courts held that the Agreement was to be interpreted as leaving all the powers of the native government unimpaired, save where they were expressly taken away or limited by the Agreement; it was doubted, for instance, whether the Uganda Order in Council of 1902 establishing a High Court with powers of appeal could validly terminate a right conferred by the Agreement to appeal from the native courts to an administrative officer.² A solution was found in the conclusion of a series of later agreements which now regulate the relations of the Buganda kingdom with the protectorate government. The Native Laws Agreement of 1910 provided that the Kabaka and the Lukiko may 'make laws governing the Baganda in Buganda', with the consent of the Governor,³ and there are agreements regulating

¹ See Chap. XII, pp. 759 ff. and 851.

² *Uganda Law Reports*, vol. i, p. 22 (1907), p. 41 (1908).

³ Buganda Agreement (Native Laws), 1910.

judicial relations¹ and other matters. These agreements have removed many of the difficulties which might have followed from the existence of dual sources of authority. The Lukiko has, subject to the veto of the Governor, an effective power of internal legislation, and has passed laws regulating the eviction of peasants by mailo² owners, the commutation of the tithe on economic crops,³ and the commutation of *luwalo*.⁴ Under an agreement with the government it has imposed a tax on land and adopted laws defining native custom in regard to succession to mailo land.⁵ At its annual plenary meeting it passes resolutions on matters affecting the relations with the protectorate authority; these resolutions, however, must be submitted to the Governor for approval. The principal ministers of state, namely the Prime Minister, the Chief Justice, and the Treasurer, are appointed by the Kabaka, but the assent of the Governor is necessary to their assuming office. The Lukiko itself is constituted on oligarchic rather than on popular lines. It consists of the three ministers, the county chiefs, or their representatives, three notables nominated by the Kabaka from each of the counties, and six other notables nominated by him from the country at large.⁶ Attempts have from time to time been made to secure the introduction of a more independent element, a measure to which the existence of an educated class in Buganda gives unusual importance; but so far these efforts have not been successful.

For administrative purposes the kingdom is now divided into twenty counties, each under a saza chief; each county is divided into districts, containing from one thousand to four thousand people, under a gombolola chief, who is subordinate to the saza chief; under the gombolola chiefs are muruka or village chiefs. In the original organization of Buganda the chiefs, though they owed their position to appointment by the central (native) government, had something of a feudal position in the areas they controlled; they had, as representatives of the Kabaka, authority in regard

⁶ Article 11, Agreement of 1900.

to the distribution of land; they were entitled to a share of the produce as tribute and to services on their own lands; their posts were often in practice of an hereditary character. The grant of proprietary rights over the mailo lands, and the substitution of fixed salaries for tribute, have deprived them of any powers in regard to land, save where they are themselves proprietors; though hereditary claims may be at times acknowledged in making appointments, the chiefs have not necessarily any family connexion with the areas in which they serve; they are subject to transfer and promotion; a system of pensions has been instituted for them, and a regular staff list is issued by the Buganda Government. Their appointment rests in the government of the Kabaka, but under the Agreement (article 9) the names of the *saza* chiefs must be submitted for approval to His Majesty's representative. By a series of agreements modifying the original treaty of 1900, a sum for the salaries of the Kabaka, the ministers, and the chiefs is provided by government based on a maximum of 25 per cent. of the total poll-tax collection. In the estimates for 1938 provision has been made for £30,880.

The revenues controlled by the Kabaka's government are derived from the proceeds of the commutation of *luwalo*,¹ or compulsory labour for communal purposes, the land tax, fees and fines from the judicial courts, market dues and licences, and other fees; the total estimated income for 1935 was £128,638, to which the *luwalo* commutation contributed £75,853. Apart from the sum received from the protectorate government in lieu of a proportion of poll-tax, the whole of these revenues may be said to be derived from sources controlled by the Lukiko itself, independently of government. The budget is prepared by a finance committee of the Lukiko; it is subject to the approval of the Governor, and major reappropriations are approved by the Provincial Commissioner as the representative of the Governor, but it is not otherwise controlled. The accounts are maintained by the Lukiko Treasury Department, but by agreement with government are now audited by an official auditor. The budget, printed in the Luganda language, is published annually. The expenditure for which it provides is mainly for the Kabaka's

¹ Cf. Chap. XI, p. 619, and Chap. X, p. 575.

ministers, judicial and administrative establishments, public works, police and prisons, markets and sanitary inspection; the Buganda authorities are not themselves responsible for medical and educational activities, though their budget provides grants to the District Boards of Education for sub-grade and elementary schools, and a reimbursement of £1,600 per annum is made to the protectorate government towards the cost of medical stores for sub-dispensaries, and over £5,000 was provided in 1937 for the erection and maintenance of dispensaries and maternity centres. The result, however, is that an unduly large part of the budget is devoted to establishment and 'overhead' charges. There is an efficient head-quarters office, which maintains the judicial and administrative records; also treasury records on the lines adopted in British territory, and a replica, of somewhat doubtful effectiveness, of the mailo land registers of the protectorate government's Office of Titles.

The Lukiko, though it only sits annually for legislative purposes, is in perpetual session for administrative and judicial work, the place of the *saza* chiefs being then taken by their representatives, usually *gombolola* or other subordinate chiefs. The court of the Lukiko consists of the Kabaka, President; the Mulamuzi (Chief Justice), Vice-president; the Katikiro (Prime Minister), and the Muwanika (Treasurer), *ex-officio* members; and three members appointed by the Kabaka with the approval of the Governor. Subject to the condition mentioned below, it has full powers in criminal cases, including the passing of a death sentence, and an appeal lies to it from the subordinate courts. These are the courts of the *saza* and *gombolola* chiefs; the *saza* chiefs have criminal powers of up to one year's imprisonment or twenty-four strokes, the *gombolola* up to three months, or ten strokes. The courts consist in each case of a bench of chiefs, presided over by a *saza* or *gombolola* chief or his deputy as the case may be; they are not constituted on the model, common to Tanganyika or Nigeria, of assemblies of elders presided over by a chief. They maintain unusually complete records, and there is a regular system of appeal up to the Lukiko court. Prisoners are confined in native prisons for which the Buganda administration is responsible, though convicts with sentences over two years are usually transferred

to the protectorate jails; the prisons are inspected by British officers, but no warrant from the latter is needed for commitment of prisoners to them. The Buganda courts have no jurisdiction in cases concerning the ownership of land registered under the Registration of Titles Ordinance, and it has been explicitly agreed that cases relating to the headship, membership, or other matters affecting clans are to go direct to the Kabaka and Lukiko.¹ Native courts in Buganda are now governed by proclamation under the Courts Ordinance,² which confirms such provisions of the Agreement of 1900 and the Judicial Agreement of 1905 as it does not supersede. In all cases involving property of over £100 in value, or sentences of over five years' imprisonment or of death, the Lukiko must refer the matter to the consideration of the Kabaka, 'whose decision when countersigned by His Majesty's chief representative in Uganda shall be final'. Both the Provincial Commissioner, or in his absence a District Commissioner or any other Magistrate, and the High Court are empowered to revise the proceedings of the Lukiko court. An appeal may also be taken to the High Court of Uganda in all criminal matters where a sentence of death or of imprisonment for more than five years or corporal punishment of over twenty-four strokes has been imposed, and in all civil matters where the subject-matter of the suit exceeds one hundred pounds. In any case, where any of the parties is not a native of Buganda there is a right of appeal to the High Court. A District Commissioner is given certain powers of supervision over native courts other than the Lukiko, including power to call for records, to stay proceedings, to direct re-hearing, or to refer the case for revision by the next highest native court; these powers are vested also in the High Court.

The agreements with the Mugabe of Ankole and the Mukama of Toro, concluded shortly after that with Buganda, and that with Bunyoro, which for political reasons was not made till 1933, recognize native administrations similar to that of Buganda, but on a smaller scale, and with less extensive powers. The Lukikos have, subject to the consent of the Governor, legislative powers, but only in regard to native law.³ As from the beginning of 1937

¹ Uganda (Clan cases) Agreement, 1924.

² *Revised Laws*, 1935, vol. iv, p. 340.

³ Native Law Ordinance, 1919.

40 per cent. of the poll-tax in Toro and Ankole is paid to the native administrations. While there is no definite condition in the Toro and Ankole agreements that the budgets should be submitted to the administration, this is done, and a provision to this effect is made in the Bunyoro Agreement. The budget estimates of these three 'native governments' showed for 1937 a total revenue of £58,895, and an expenditure of £55,039. The organization of county and district chiefs is similar to that of Buganda; their appointment vests in the paramount chiefs, but in practice they are approved by the Provincial Commissioner. The judicial powers exercised by the various courts are on a lower scale than those of Buganda, but gombolola courts in Bunyoro have greater powers than equivalent Buganda courts. Appeals go to the district court, usually, but not necessarily, presided over by the District Commissioner, who has also a full power of revision; the High Court here exercises only a power of revision and not of appeal. The Bunyoro Agreement introduces a further condition, that the courts must be constituted by the Governor and their powers prescribed by warrant.

Outside the Buganda kingdom and the three 'native governments' no central political organization exists which recognizes a hereditary paramount chief; and at one time the protectorate administration nominated Buganda agents to chieftainships outside their own districts or placed local chiefs under their tutelage. That system had its uses, but the agents have now been withdrawn. The government has, however, reproduced much of the Buganda system in these areas, though without any attempt at rigid standardization. In the Acholi District, into which the former Gulu and Chua Districts were amalgamated in 1937, two tribal administrations exist. Similarly, the Central District, formed by the amalgamation of Bugishu and Bugwere, retains the two original native administrations. In the west, however, the tribal councils combine to form a district council, and there is a single native administration for the whole district. Districts are divided into counties under a chief who bears the name of *saza* or its equivalent, and they are also divided into smaller units, similar to those of the gombolola or *muruka* divisions of Buganda. Where the hereditary principle is of long standing, as, for instance, in Busoga, or where certain clans have furnished sections of the

community with their leaders, as in Acholi, these traditions are taken into account in appointing the county or district chiefs. But the chiefs are not, as in some areas under indirect rule, necessarily the traditional leaders recognized by native custom; they owe their position to selection, in which ability and education are taken into account; but almost every chief to-day is of the same tribe, and often of the same subdivision, as his subjects. Local opinion is as far as possible consulted in making these appointments. The Lukiko or district council is composed of the county chiefs, who select their own president. In certain areas elders are admitted in addition to the chiefs, and the councils are likely in the future to include an increasing degree of popular representation. The native authority revenues are derived from a rebate on the poll-tax, which is normally 20 per cent. from luwalo commutation where this practice exists, and from local dues. In these areas the budget is prepared by the District Officer after consulting the Lukiko; the latter has only the competence of an advisory body. The total income of the eleven native authorities of this type was in 1937 estimated at £255,845. The district councils are, under the Native Authority Ordinance,¹ entitled to issue orders having the force of law for certain specified purposes. In certain cases also the councils are authorized to make rules defining or modifying native law and custom; but this power seems to be little used in practice. The ordinance imposes on chiefs the obligation to detect and prevent crime (an obligation in which they are assisted by their own police, as provided by section 4 of the ordinance) and to issue orders for a variety of specified purposes, including the making of reserves of food against famine, the eradication of insect pests, and the use of compulsory labour on public works. The constitution and jurisdiction of courts are governed by a series of proclamations under the Courts Ordinance,² the district native court, or the court of the Lukiko, being the court of appeal for the area; supervisory and appellate jurisdiction is exercised by the District Commissioner in his magisterial capacity. The court in these areas consists of a bench of chiefs and there are rules prescribing the quorum in each area.

¹ *Laws (Revised Edition)*, 1935, cap. 112; *Native Law Ordinance*, 1923.

² *Revised Laws*, 1935, cap. 39.

Uganda, as will have been seen, makes a very full use of native authorities as agencies of local government; there are, however, significant points of difference between its policy of native administration and that of Tanganyika or Nigeria. The distinction does not lie entirely in the attitude adopted towards traditional native institutions; the political organizations of Buganda, Toro, Ankole, or Bunyoro have a long history, and are as fully accepted by the people as those of Northern Nigeria. The characteristic difference lies in the policy of appointing the county or subordinate chiefs, and in the growth of a system under which they have taken in Buganda, and tend increasingly to take elsewhere, the character of an official service working within the native administration system. In Uganda, in a large part of which the Hima organization had already imposed itself on the older clan institutions, such a development was natural; the Buganda system of rule was in itself largely one of direct administration. The chiefs appointed under this system appear to lack neither authority nor influence. The experience of Uganda would seem to prove that the successful use of native authorities in local government cannot be determined on any one principle; there seem to be circumstances in which the appointed chief can be as efficient an agent in native administration as the hereditary or tribal chief. The study of the Uganda system, however, presents another problem, peculiar to Uganda itself. The construction placed in practice on the Agreement of 1900 has created an unusual situation in regard to the Buganda kingdom. The terms of the Agreement do not, on the one hand, appear to permit of that full integration of the native administration with the institutions of the protectorate government which is possible in Nigeria; the existing practice, on the other hand, does not seem to give to Buganda that autonomy over its own internal affairs which might appear to be contemplated by the Agreement. There are now some eleven administrative officers serving under the Provincial Commissioner in Buganda Province, and apart from the supervision exercised by them over the work of the subordinate courts, their presence necessarily involves direct relations with the *saza* and *gombolola* chiefs in their administrative work. They control tax assessment and collection and are concerned in the carrying out of such of the

protectorate ordinances as apply to Buganda. Again, the Buganda native government is not responsible for educational, agricultural, or medical activities; there is inevitably some intervention by officers of the central departments in Buganda affairs. In theory the position of the protectorate officers in such matters is that of advisers; in practice they take a direct part in Buganda administration, though the manner in which this is exercised is perhaps less openly marked than it was at an earlier period, particularly in regard to such matters as the transfer of *saza* and *gombolola* chiefs. The relations of the Kabaka and his ministers with the protectorate government have in the past been such that the question of the correct interpretation of the Agreement of 1900 has presented no great difficulties; but it may be questioned whether the present system, apart from any question of the interpretation to be placed on the Agreement, takes full advantage of the opportunity offered by the Buganda organization as a training-ground in administrative responsibilities.

XII. NORTHERN RHODESIA

In Northern Rhodesia some seventy tribes roughly fall into five groups according to their allegiance, languages, and customs. It is not uncommon to find a group of villages of one tribe surrounded by villages of another tribe, or that tribes extend into neighbouring territories, and have a paramount chief residing in a foreign country. Each of these tribes had its own system of native government, varying from the highly centralized government of the Lozi to small chiefs with only two or three subject villages.

The policy of the Chartered Company, save in respect of the treaty state of Barotseland, was one of direct rule, using the existing chiefs as agencies of government, but upholding their privileges so far as these were not incompatible with company rule; little or nothing was done towards amalgamating petty authorities to enable more effective administrations to develop; and the general effect of the policy was to preserve the outward form of the indigenous systems, but to undermine the authority of the chiefs both by making them dependent on the Administrative Officer and by taxation which obliged large numbers of men to leave their villages for considerable periods for work. At first the company confined itself

to the prevention of inter-tribal wars, the collection of tax, and the removal of the administration of justice from the hands of the chiefs; in 1908 rules for the administration of natives defined the relations between the government and the natives. The amalgamation of North-Eastern and North-Western Rhodesia took place in 1911, and the former rules were replaced by the Administration of Natives Proclamation of 1916. This proclamation made provision for the appointment and dismissal of recognized chiefs by government, and defined their duties, but the Administrative Officer was held responsible for the general control of his district, and failure to carry out his 'lawful' orders was punishable in the case of chiefs and headmen; natives were required to carry out 'reasonable' orders or requests of both the chief and the native commissioner, and under this provision chiefs were able to exercise a considerable amount of control over their people in exacting customary free labour in their gardens and even in the recruitment of paid labour for government; chiefs were paid small subsidies by government.

In 1924 company rule ceased, the territory became a British protectorate, and the recommendations of the commissioners appointed to advise on the delimitation of native reserves¹ attracted attention to the importance of allowing the natives a larger measure of self-government in their tribal areas. The appointment of Sir James Maxwell, whose previous experience had been on the West Coast, paved the way for the introduction of a policy of native administration more in accordance with that already existing in other territories under the Colonial Office. A conference of administrative officers convened in 1927 made recommendations regarding the introduction of a system of indirect rule, and was followed by ordinances constituting native authorities and courts, introduced in March 1929 and put into effect in the following year.

The Native Authority Ordinance conferred powers similar to those given in Tanganyika, including the issue of 'orders' relating to a specified range of subjects and enforceable in a native court, and the making of 'rules for peace, good order and welfare'; it is noticeable, however, that it omitted any reference to native treasuries, a reflection of the recommendation of the conference,

¹ See Chap. XII, p. 740.

which did not consider the growth of financial responsibility desirable, at least for some considerable time.

Where definite tribal organizations existed, such as among the Wemba and Ngoni, unofficial native authorities and courts were already functioning and, as the Secretary for Native Affairs remarked in 1930, all that was required was to explain the working of the new system and to foster the exercise of the increased administrative powers vested in the authorities by the ordinance. In other areas the process of constituting native authorities was not easy; the chief had often degenerated in the eyes of his people into a *kapitao* in the employment of District Officers, and in some areas it was difficult to find any evidence of tribal cohesion; the absence of large numbers of the adult male population for long periods at work, the multiplicity of chiefs and tribal divisions, and the unsatisfactory character of many of the chiefs, left the native authorities, as before, agents of the general administration rather than organs of self-government. The existence of councils in the tribal organization does not appear to have been fully appreciated at the time, though the character of a council is often more important than that of a chief.

The Native Authority Ordinance of 1929 was replaced in 1936 by a new ordinance,¹ which does not differ greatly in substance, but lays stress on the need for making full use of the traditional native machinery of government. Provision was made for future development, such as the setting up of native councils in the non-native areas, and for the establishment of native treasuries and the levy of local rates. Treasuries are now in process of establishment. The 1936 Report on Native Affairs notes that sections of tribes which had previously been divided have shown a readiness to combine into units with superior councils, to enable more substantial treasuries to be formed than would be possible if the previous divisions were allowed to remain. A circular issued by government in 1936 lays down instructions in connexion with this development; native treasuries are to receive 10 per cent. out of the taxes paid by natives of their areas, whether in the districts of origin or elsewhere, the latter provision being of particular importance in a country where a large percentage of taxpayers pay at their place

¹ Native Authority Ordinance 9 of 1936.

of work: the treasuries are to be tribal for the most part with sub-treasuries where the tribal unit is large. The recent committee on taxation has recommended that instead of 10 per cent. of the tax a fixed sum of 1s. 6d. per tax should be paid to the treasuries. The revenues, apart from the percentage of native tax, are of two sorts, those the authorities collect on their own behalf, such as court fines and fees, and those which they collect for government, such as game and other licences; the latter will be paid into general revenue, but are to be repaid from general revenue to the native treasuries. The payment of fines in kind is discouraged. The salaries of chiefs are to be paid from the treasury funds and are calculated according to the status of the unit as expressed by the gross amount of the tax which it pays. Sir Alan Pim has pointed out that the treasury revenues are no more than sufficient to provide a reasonable standard of pay for chiefs and their clerks and messengers. The chiefs have lost the right to unpaid labour, which formerly enabled them to maintain reserves of food for the numerous calls on their hospitality,¹ and have received no compensation; their present salaries do not enable them to meet their obligations. He suggested that the proportion of the tax paid to native treasuries should be raised to 20 per cent.² In 1938 a provision of £30,000 was made for a central treasury fund from general revenues, and it is hoped to make similar provision in 1939. Certain revenues from land in reserves are to be merged into this fund, which will be used for development schemes and, as in Nyasaland,³ for assistance to impecunious treasuries. As in Tanganyika Territory, the lack of experience among the chiefs has necessitated a close measure of control and it is not to be expected that native administration treasuries can be effectively administered by the native authorities themselves at this stage: this is recognized in the circular already referred to, and the extent to which it is possible to devolve responsibility on chiefs of widely different degrees of ability and civilization must vary considerably. The power to make orders has been extensively used, but the nature of these reflect rather the influence of the Administrative Officer than that of native custom and traditional practice.

² *Report on the Financial and Economic Position of Northern Rhodesia*, Colonial 145, 1938, pp. 186-7.

³ See below, p. 464.

The Native Courts Ordinance of 1929, also brought into force in 1930, found a more favourable field for development than the Native Authority Ordinance. The chiefs had, even under the rule of the Chartered Company, continued to exercise jurisdiction, particularly in civil matters, with the encouragement of the company's officials, and in most parts of the country civil cases were taken to the European courts only when there was dissatisfaction with the chief's ruling or when, owing to the chief's lack of authority, it was not possible to obtain enforcement of judgments. The ordinance of 1929 was of an experimental nature and was replaced by the Native Courts Ordinance of 1936. Jurisdiction and powers are given by warrant; stress is laid on the character of the courts as traditional institutions in which practice is to be in accordance with native law and custom; they are now 'recognized', not as in the previous ordinance, 'appointed', and provision is made for a regular system of appeal to native courts of appeal, thence to the magistrates' court, and finally to the High Court.

The geographical and economic detachment of the Barotse Province of Northern Rhodesia, often called Barotseland, and the character of its native institutions, have given it a type of native administration which has similarities with that of the High Commission territories. The European population numbers only 200; most of the province has been reserved from prospecting for minerals;¹ the native society has a well-established type of centralized rule. The political power is in the hands of one dominant tribe, the Lozi, and hitherto many of the subject tribes have had little share in the management of affairs. Except in the western part of the Balovale District, the land is vested in the paramount. The country is divided into districts over which the paramount places indunas who are usually Lozi and often members of the ruling family; in areas where subject tribes have their own chiefs the indunas represent the authority of the paramount. This system has led to considerable discontent among tribes such as the Lundi and Lorele in the extreme north-west of the province and a demand for independence from the alleged misgovernment of the Lozi indunas. These two tribes also dispute the suzerainty of the

¹ See Chap. XXII, p. 1521.

paramount. The dispute is as yet unsettled. Lozi rule has some of the characteristics of constitutional government. The paramount is subject to the control of the Kgotla, which is both a legislative and a judicial body; it has a Prime Minister appointed by the paramount, and thirty members representing both the head-quarters and the provincial centres. The decisions of the Kgotla are put before the paramount, who considers them with the aid of a family privy council, the Sikalu. There is a regular system of local Kgotlas, on which the paramount is represented by his indunas; judicial appeals from them go to the central Kgotla.

Barotseland came under protection as the result of an agreement made in 1890 by the Paramount Lewanika, one of the outstanding figures of African history. When in 1891 the operations of the British South Africa Company were extended north of the Zambesi, the administration of justice in Barotseland was not entrusted to the company; in accordance with the Africa Order in Council, 1889, it was to be in charge of a commissioner, but the first such officer did not arrive in the territory till 1897. In 1900 the company made an agreement with Lewanika, which the Secretary of State approved in 1901; it was concluded as a 'treaty or alliance' between the Barotse nation and the British government, and has formed the basis of subsequent developments. The company obtained the right to adjudicate in all cases between Europeans and Africans, cases between natives being left to the native authority. The paramount retained his customary rights, and was to be paid £850 a year by the company. This agreement and a subsequent agreement of 1909 reserved Barotseland from prospecting, and provided that European immigration was not to be allowed save with the consent of the chief and his people. In 1911, when North-Eastern and North-Western Rhodesia were amalgamated under the company, the Order in Council provided that it should be unlawful to alienate any of the areas reserved from prospecting. When it was proposed to utilize the powers conferred by an Order in Council of 1900 to impose taxation, the Secretary of State required that the assent of the paramount should first be obtained; the arrangement finally concluded in 1905 was that 10 per cent. of the tax from north-western Rhodesia should be paid into a fund for use on works to benefit the native inhabitants of Barotseland,

subject to the payment of a subsidy to the paramount in lieu of his previous right to tribute from subject tribes. In a letter of November 8 of the same year the paramount agreed that the British courts should have the power to decide civil and criminal cases between natives, except in a reserved area, where they would have jurisdiction only over cases of murder and of any other offence against the law of England, such as witchcraft. By further agreements, and in virtue of Proclamations 2 and 3 of 1913, the chief and his Kgotla received in the greater part of Barotse Province full powers in civil proceedings affecting natives only, and full powers in criminal proceedings affecting natives except when the offence was punishable according to the law of the territory with death, or imprisonment exceeding six months, or lashes exceeding twelve; it is of importance to note that this arrangement did not provide for any supervision of the proceedings of the native Kgotlas, nor for any formal right of appeal. In 1924 it was agreed with the paramount that he should abandon the previous system of exacting twelve days' compulsory unpaid labour from his subjects; he received in return an annual allowance of £2,500, of which £2,000 went to the chiefs and indunas who had shared the privilege. In 1925 a Barotse Trust Fund was established by an ordinance¹ under which the fund received, instead of the 10 per cent. referred to above, a sum representing 30 per cent. of the tax collected from the natives of Barotse Province. The fund was administered by a board consisting at first of five government officers and two missionaries; in 1933 a revised constitution provided for three government representatives, the paramount chief, and a fifth member nominated by him in consultation with the Provincial Commissioner.

The system thus developed was one which involved a relatively minor degree of intervention from the administration, and it is noteworthy that at each successive stage any change introduced was effected by agreement with the paramount and his Kgotla. The system involved little friction between the British and native authorities, but it revealed some difficulties. The native courts, in the absence of any legal sanction behind them, had trouble in enforcing their decisions; the right of appeal to the central

¹ Barotse Fund Ordinance 18 of 1925.

Kgotla was ill defined, the sphere and jurisdiction of the magistrates' courts were ambiguous, and there were difficulties in allocating the sums due respectively to the paramount and the indunas and for public expenditure. It was these considerations, rather than the more deep-seated difficulties to which reference has been made in dealing with Bechuanaland, which led the government of Northern Rhodesia to enter on discussions with the Lozi for a revision of the existing system. Their agreement was obtained in 1936, and the Barotse Native Authority and Native Courts Ordinances took effect in January 1937.

The first ordinance¹ provided for the recognition of native authorities by the government, and for the withdrawal of such recognition 'on the recommendation of the Paramount Chief'. The extent of the powers conferred is to depend also on the paramount's recommendation. Withdrawal of recognition may be accompanied by an order to leave the area in which the holder of the office has exercised jurisdiction. The powers of native authorities include the regulation of matters affecting social and economic welfare, and extend to the suppression of practices which are harmful or contrary to native custom; the Governor may, after consultation with the paramount, himself issue any order or rule which the native authority has omitted to make, or may, after similar consultation, revoke any order or rule issued by it. Under this ordinance, the paramount and his Kgotla have been recognized as the supreme native authority for the whole province, and seven local Kgotlas recognized as subordinate native authorities. Corresponding changes were made in the administration of the Barotse revenues; the Trust Fund was taken over by a central native treasury,² which has sub-agencies in the districts, and is controlled by the paramount and Kgotla, subject to the supervision of the Governor, to whom estimates are submitted for approval, and of the Commissioner, who countersigns all cheques. The estimated revenue in 1938 was £13,446, of which nearly £8,666 was for emoluments to indunas and members of the chief's family. On the judicial side an ordinance³ confers jurisdiction

¹ Barotse Native Authority Ordinance 25 of 1936.

² Ordinance 27 of 1936.

³ Ordinance 26 of 1936.

upon 'recognized' courts, but their constitution is to be determined by local law and custom; on the recommendation of the paramount a member may be suspended or dismissed. The courts have civil and criminal jurisdiction in native cases to an extent defined in their warrants, though the boundary between the two is far from clear; there are no powers of supervision in civil cases; their criminal powers do not include cases punishable with death or, except with the approval of the District Commissioner, relating to witchcraft. The courts administer native law, the orders and rules made under the Barotse Native Authority Ordinance, and any law included under their jurisdiction by the Governor. A report of all criminal cases must be submitted to the administration, and administrative officers have full power of revising the decisions of the tribunals. Provision is made for appeals to a Native Court of Appeal and thence to the Provincial Commissioner's Court, or, in civil cases, to the High Court. Two superior courts have been recognized, and in the institution of subordinate courts the opportunity has been taken to eliminate a number of superfluous tribunals. The ordinance removes any doubt as to the jurisdiction of the government courts, and provides a legal process whereby native courts are enabled to enforce their judgments.

Conditions of native life in Northern Rhodesia are affected by the presence of a mining industry which employs about 15,000 men¹ mostly drawn from the country itself, and large numbers of the male population also leave the country for work in neighbouring territories. Some 50 per cent. of the adult males are said to be absent from the villages of some districts at one time.² Again a large urban native population lives outside tribal control and in the European farming area, remaining for periods of varying lengths away from the influence of the native authorities and of tribal life. The European population of 10,588 is greater than that of the other East African territories except Kenya, but it differs from that of Kenya in that a relatively large proportion is engaged in industry and the resident farming population is less numerous. The European representatives in the legislature have directed their attention to the government's alleged neglect to provide adequate

¹ See below, p. 514.

² *Report*, op. cit., Colonial 145, p. 36.

medical and other services for the natives rather than to discussions of native policy as such.¹ The economic interests of native and European do not yet conflict to any degree; the lack of agricultural development among natives has left them dependent on the labour market for earning money, except in a few districts where proximity to the railway line has allowed their entry into the maize market, but it is significant that under pressure from European maize growers competition has been eliminated by means of a Maize Control Ordinance² which fixes the price and the quota of maize for both natives and Europeans.

These factors are not without importance in the future development of local native government through the customary authorities. Northern Rhodesia will provide a significant test of the question whether native authorities are able to maintain the respect and interest of a population which is subject to the powerful influence of industrial and urban life.³ The numerous natives living in urban conditions create a problem of a different class, but of no little importance; it will be discussed in a subsequent section of this chapter.

Under the Chartered Company the Native Affairs Department was controlled by a Secretary for Native Affairs who was responsible to the Administrator and had a seat in the advisory (later the legislative) council. This post was abolished in 1934, and native affairs are now dealt with in the Secretariat by an assistant Chief Secretary for Native Affairs. The Senior Provincial Commissioner has a seat in the legislative council and is the government's principal adviser on native matters. There is no separate staff dealing purely with native affairs; the local administrative staff (Provincial and District Commissioners) deal with both non-native and native affairs. In areas where European interests are predominant, such as on the copperbelt, their time is largely taken up by non-native matters, a difficulty which, in the absence of native institutions, the government has attempted to meet by an increase of European staff.

³ See below, pp. 512-15.

XIII. NYASALAND

The early records of the Nyasaland Protectorate make frequent reference to the difficulty of finding native authorities who could be utilized for the purposes of the administration. The government of the British Central Africa Protectorate had recognized to some extent the position of those chiefs with whom it had made treaties; they received a subsidy of 10 per cent. of the hut tax in lieu of tribute, and a few chiefs were also given annual allowances in compensation for the abrogation of their rights to levy tolls on passing caravans. The introduction of direct tax collection by district officers, and the gradual cessation of the allowances on the death of the original recipients, left chiefs and headmen without a fixed income, and their status suffered a general decline. There were, moreover, other circumstances which militated against the development of a system of local government based on traditional authorities. The original inhabitants of a large part of the country had been reduced to subjection by Ngoni and Yao invaders; the invading tribes themselves were split into small groups, and some of their more prominent chiefs had at one time or another been in conflict with the government. In 1904 the Nyasaland government commented not only on the absence of chiefs on whom it could rely for assistance, but on the tendency for the larger communities to disintegrate; small men were apt to 'collect a surrounding of friends and to go off and build new hamlets in other localities'.¹ Tribal leaders still arbitrated in disputes between their followers; but in other respects it was considered that the customary institutions had largely broken down. There was another factor which operated against the use of native authorities; considerable areas had been alienated to Europeans,² and in some districts, notably Zomba and Blantyre, a large proportion of the population was resident on European estates. Nevertheless the government wanted agents who could assist the local officers in the work of administration. The satisfaction of this need, however, was not sought in an attempt to restore the influence of the traditional authorities; the District Administration (Native) Ordinance of

¹ *Annual Report on the Protectorate, 1903-4.*

² See Chap. XII, pp. 755-9.

1912 was designed to 'supply a salutary measure of discipline and control in village life to replace the old system of tribal rule by chiefs, which has fallen into decay with the evolution of native life and the passage of time'. It provided for 'the gradual formation of a subsidiary local government by means of sectional councils of headmen chosen as far as possible by the natives themselves and presided over by the District Resident', but the position of headman was to be in no sense 'similar to the archaic one of chief'. For this purpose districts were divided into administrative sections under charge of principal headmen, the section being in turn subdivided into village areas or groups of villages in charge of village headmen. The sectional council consisted as a rule of the principal headman and two councillors selected from among the village headmen; but it is characteristic of the system that the sections did not necessarily coincide with tribal boundaries. The district officers had power to require the concentration of huts in order to form villages. The principal headmen were chosen as far as possible from the recognized tribal or territorial chiefs; but the ordinance permitted Residents to consider also the claim of persons of good standing, intelligence, and reputation. Principal and village headmen were paid, but on a very low scale; though the existence of native courts was recognized, they were given no statutory position, and headmen were given no judicial authority, though they were used as assessors in native cases; their administrative functions were mainly confined to carrying out police and sanitary regulations and the improvement of village communications. The sectional councils derived their authority from the District Resident, who presided over them. The ordinance was not applied in the first instance to the districts in which large areas of land had been alienated to Europeans; it was not, indeed, till a much later date that some of its sections were extended to such areas. An Ordinance of 1924¹ gave to the headmen the new power of calling out compulsory labour for public works, and it also constituted a series of village, section, and district councils, consisting of nominated headmen and others; their functions were purely advisory. An Ordinance of 1929² made provision for native

¹ District Administration (Native) Ordinance, 1924.

² Courts Ordinance, 1929.

courts, in the form of section courts presided over by a principal headman.

The system embodied in these ordinances was directed to remedy conditions which were held to be due to the disintegration of the traditional institutions; the function assigned to the native authorities which it created was that of auxiliaries to the administration, and it made no effort to institute responsible agencies of local self-government. The institution of a more effective system of local self-government was advocated by the Northern Nyasa Reserves Commission of 1929, and by a conference of administrative officers in 1930; and a substantial revision of the existing system was effected by the Native Authority and Native Courts Ordinances of 1933. The former of these two ordinances resembles that which regulates the position of native authorities in Tanganyika, but it provides also for the temporary suspension of a recognized native authority and for the removal from their tribal territory of chiefs whose 'recognition' has been withdrawn. The ordinance did not in practice involve any considerable change in personnel. For the most part the chiefs recognized under it as native authorities were those who had been principal headmen, but it involved the abolition of the former artificial division of tribal areas into administrative sections, and the opportunity was also taken to make some readjustments in the light of actual tribal conditions. The tribal organization of the Ngoni, neglected under the former system, was revived, and elsewhere, as among the Tumbuka, the claims of the traditional chiefs were given a fuller recognition; among the Tonga in West Nyasa a tribal council was substituted for the four principal headmen. The native treasuries instituted under the ordinance are credited with a specific contribution of $8\frac{3}{4}$ per cent. of the tax collected, which is allocated for the payment of chiefs. Their general resources are drawn from court fines, and from a proportion of rentals received from tenancies in native areas fixed in 1936 at 25 per cent., the remaining 75 per cent. being paid into a central fund from which grants may be made to the poorer treasuries, and for financing capital works such as building of shelters for travelling natives, rural dispensaries, and bridges. In these circumstances the native authorities have little scope for expenditure; the share

of the tax allocated to the payment of chiefs is the largest item both of revenue and expenditure. The treasuries of the Southern Province had in 1935 a total revenue of £3,886, an average of only £880; the ten treasuries of the Northern Province had a total income of £9,142, but of this the expenditure on chiefs' salaries and other personal emoluments amounted to no less than £6,908.

The ordinances of 1933 represent an attempt to introduce in Nyasaland the methods associated with indirect rule. That attempt has already met with some success. Experience has shown that the tribal institutions have a greater vitality than was assumed in the earlier days of the protectorate, and that chiefs still exercise an authority which can be used to good purpose. On the other hand, the system is still at an experimental stage, and it has to overcome conditions developed under the previous system of direct administration. It is perhaps inevitable in the circumstances that the administration should, at the outset, have hesitated to give any large measure of responsibility to the native authorities; the direct collection of the tax by officers of the administration, and the decision to make the native treasuries depend on local resources for their finance, result in giving the native authorities a limited range of powers as compared with those of Nigeria and Tanganyika.¹ But the experiment is of unusual interest in view of the special circumstances of Nyasaland. The wide extension of education, mainly of a type designed to fit the native for employment under Europeans, and the existence of a relatively large proportion of natives with experience of residence in other territories,² tend to create an element which is likely to be critical of traditional authorities, if not indeed antagonistic to them. The future of the system of native administration now in force will be largely determined by the attitude taken by this element.

XIV. THE GOLD COAST

The system of government in the Gold Coast has been described as 'a mixture of direct and indirect rule, with a steady bias towards the latter'.³ If, however, there is a bias towards the methods

¹ For duties of native authorities in connexion with taxation, see Chap. X, pp. 566-7.

² See Chap. XI, p. 607.

³ *Annual Report on Social and Economic Progress, 1935-6*, p. 6.

of indirect rule, it is more evident in the Northern Territories Protectorate than in the Gold Coast Colony. The early history of the Gold Coast administration was one of hesitating and unwilling intervention in native affairs outside the forts in which trading interests were concentrated. The Akan chiefdoms or 'stools' were well-established political organizations, and the establishment of treaty relations with them appeared more expedient than the extension of administrative rule. Farther north the Ashanti confederacy was of a strength which enabled it not merely to resist political interference, but indeed for many years to defeat invasion. Such control as was attempted in regard to the Akan chiefdoms was in the first instance limited to the establishment of a court, presided over by the Governor, with chiefs as assessors, to deal with disputes arising in the tribes. At the time the court was established, about 1831, it had no legal basis,¹ though its decisions were readily accepted owing to its superiority over the system of justice obtaining in the chiefdoms. The passing of the first Foreign Jurisdiction Act in 1843 provided a means for giving a legal position to the court; but the government, following the advice of a Select Committee of the House of Commons in 1842, preferred to base its jurisdiction on agreement with the chiefs,² and this was effected in 1844 in the agreement known by the name of 'The Bond'. The agreement was itself of little intrinsic value, though it subsequently acquired some importance as the basis of the claim that any levy of taxation must depend on the 'consent of the chiefs and their people'.³ It was, however, accepted as justifying the issue of the Order in Council of 1844, which, after reciting the terms of the Foreign Jurisdiction Act of 1843, established the jurisdiction of government officers in regard to cases arising outside the forts.

When in 1852 the administration sought to secure by direct taxation the means for extending educational and medical services in the native areas, the chiefs were invited to organize themselves into a legislative assembly of native chiefs for the purpose of imposing the tax on their subjects; as shown elsewhere,⁴ it was found

⁴ Chap. X, p. 585.

impossible to collect the tax and the ordinance imposing it was repealed in 1866. The spirit in which the British government envisaged its relation to the chiefs was again illustrated by a recommendation made by the Select Committee of Parliament appointed in 1865 to consider the future of the West African establishments. It asserted that the extension of 'the protectorate of tribes about our forts in the Gold Coast assumes an indefinite and unintelligible responsibility on our part, uncompensated by any adequate advantage to the tribes', and recommended 'that the Protectorate should only be retained while the chiefs may be as speedily as possible made to do without it. Nothing should be done to encourage them to lean on British help, or to trust to British administration of their affairs.'¹ As regards justice, the chiefs should be left to exercise their own jurisdiction, subject to an appeal when necessary to the English magistracy.

The views of the Select Committee reflected the spirit of the current British policy in regard to colonial affairs; its primary concern was with the facilities which native territories offered for the expansion of trade, and it sought to limit its obligations to securing such order as was needed for this purpose. The policy was impossible to maintain in practice. The maintenance of order necessitated a control over the chiefs which prejudiced the traditional organization of tribal authority; the provision of even the most elementary system of justice created claims which involved a progressive measure of intervention. In the Gold Coast there was an additional circumstance which brought conviction of the impossibility of maintaining non-intervention. The Ashanti War of 1873-4 demonstrated that in the interests of peace itself it was essential to govern the native territories. The institution of a legislative council for the Gold Coast Colony in 1876 was followed by the enactment of the Native Jurisdiction Ordinance of 1878, which provided a legal basis for the extension of control; this was replaced by an Ordinance of 1883, which, with certain amendments in 1910 and 1924,² remained the basis of native administration in the Gold Coast Colony until 1927.

The ordinance gave authority to chiefs to issue by-laws on a defined list of subjects, including such matters as the maintenance

¹ Sir W. B. Griffith, *op. cit.*, p. 17; cf. Chap. V, p. 133.

² *Laws*, cap. 113.

of communications and the care of unoccupied lands. On the judicial side the ordinance recognized the jurisdiction of native tribunals, composed of the chiefs and their councillors as authorized by native law. These tribunals, besides dealing with breaches of by-laws made under the ordinance, also had jurisdiction over minor civil causes and in all cases relating to land held under native tenure, with powers to punish minor offences, including disobedience to the orders of a chief. In form, therefore, the ordinance resembled those which were at a later date passed to regulate native administration in areas under systems of indirect rule; that it produced other results is due to the different conception held in the Gold Coast of the position of the chiefs in relation to the administration. The ordinance made no provision for the appointment of chiefs by government, nor for any procedure for declaring which chiefs should be entitled to exercise jurisdiction; it appeared, therefore, to recognize that the right of jurisdiction was inherent in the chief, though the extent of its exercise might be subject to regulation. In practice this led to the establishment of tribunals in the smallest villages, which the administration was unable to close. Again, though provision was made for an appeal to administrative officers, the latter had not those powers of supervision and revision which, as experience has shown, form the real guarantee of the efficient working of native tribunals. Fines were appropriated by the court, and the course of justice was further prejudiced by the peculiar local custom, connected with the Omanhene stool, known as the chief's 'oath'. This 'oath' was usually the name of a place where some disaster had occurred, and the swearing of it by a person found to be in the wrong involved the payment of a fine to the occupant of the stool to which the oath was attached.

The provision made for the enactment of by-laws by chiefs, which at a later date proved in other areas to be a useful measure of local self-government, largely failed of effect in the Gold Coast, owing to the lack of means for compelling native authorities to enforce the operation of the by-laws. A typical case arose in regard to the by-laws passed, at the instance of the administration, for dealing with pests affecting cocoa; the by-laws were entirely inoperative, and the government was compelled to pass its own

Pests Ordinance,¹ and to appoint inspectors to see it carried out.

The position of the Gold Coast chief was, and still is, unusual. The office is elective from the stool family, and an unpopular chief is liable to 'destoolment' by the persons who elected him. Under British administration the practice became common; between 1904 and 1926 there were no less than 109 destoolments, and at an earlier stage a chief who interested himself in the enforcement of an unpopular measure usually found himself destooled. Though the procedure in connexion with destoolments has been regularized and to some extent controlled by subsequent legislation,² destoolments remain frequent. The stools or native administrations finance themselves by the proceeds of court fines, of market fees, and of the rent or sale of stool lands, or by raising occasional levies which are voluntary only in the sense that they are not supported by any law. Since these funds are not supplemented by any contribution from government taxation, they are not unnaturally regarded as available mainly for expenditure on stool purposes, including the personal needs of the chief and his councillors; their expenditure is not controlled by the administration, and large sums are wasted on litigation regarding stool lands.³ Some stools are heavily in debt; the native administration is in effect mainly an agency for the maintenance of the stool government; it is not used, or indeed capable of being used, as an agency for effecting improvements in local conditions. The responsibility for such improvements is discharged directly by government.

The deficiencies of the ordinance were obvious; but the government was at the outset concerned to effect an improvement in its judicial rather than its administrative working. Between 1894 and 1922 no less than five Bills were drafted, with a view to securing better control over the judicial system. For the most part attention was directed to providing that jurisdiction should be confined to such chiefs as were confirmed in their judicial capacity by government; but proposals to this effect met with persistent opposition from the party which supported the interests of the chiefs in the legislative council. The discussions are of interest,

¹ Ordinance 37 of 1923.

² Native Administration Ordinance, 1927.

³ See Chap. XII, p. 857.

for it is only in the Gold Coast that this aspect of native administration can be said to have become a matter of public controversy. The chiefs claimed, partly on general grounds, and partly on the basis of the proceedings of 1844 and 1852, that their rights were inherent and not derivative; government was accordingly not competent to withdraw or even to vary their jurisdiction. The Order in Council of 1901, which annexed the Gold Coast territories, clearly constituted the Crown as the only source of legal authority; nor did the proceedings of 1844 and 1852 afford the chiefs either legal or moral ground for claiming that the Crown was bound to allow them the exercise of an independent form of jurisdiction. At the same time their case appeared to receive some support from the fact that the government had never taken steps to define the constitutional position of the chieftdom. The Ordinance of 1883 gave the Governor authority to suspend or depose a chief who appeared to have abused his power, and the Chiefs' Ordinance of 1904 allowed him to 'confirm' election and installation. This latter provision, however, was intended to render a chief's authority unassailable at law; neither in this ordinance, nor in any other law, had the Crown taken the position which it assumed in Nigeria or Tanganyika, that the chief can exercise no legal powers until formally recognized as native authority. All the five Bills were eventually abandoned, though this result was perhaps due less to the opposition of the chiefs' party than to the inability of the administration itself to arrive at an agreed decision on the question of principle involved.

It is legitimate to ask why the government did not feel itself able to adopt a system of native administration similar to that which was introduced in Nigeria in 1916. The Gold Coast system was designed to show the greatest possible respect to the position of the chief as representative of the stool; but this policy in itself forbade the application of that measure of control which made it possible to treat native institutions elsewhere as effective agencies of self-government. Just because it was sought to respect as far as possible the powers which custom gave to the chief, his authority was necessarily restricted to that field; and in the wide range of matters outside the sphere of stool interests, administration inevitably tended to take a direct form. A further

consequence ensued. The mismanagement by the chiefs of stool affairs, more especially in respect of the disposal of stool lands,¹ and the extension of a system of direct rule in other matters, tended to reduce the reputation and the authority of the chiefs; and as early as 1901 the Governor reported that they had so little control over their people as to make it doubtful whether the system of indirect rule could be extended to the Gold Coast. Policy tended rather to the grant to the chiefs of a political position as members of the legislative council than to the use of the stools as part of the administrative machinery of government.

The situation was one which gave the Gold Coast the benefit neither of a direct nor an indirect system of administration; and in its inability to find a solution the government accepted in 1927 a Bill put forward by a number of the chiefs, and embodied it in the Native Administration Ordinance of that year. The ordinance made some advance in recognizing as part of the hierarchy of administration not only the chiefs,² but their councils; the paramount chiefs' tribunals received appellate powers and their original powers in civil cases were enhanced. But the most important provision of the ordinance lay in the recognition of the Provincial Council, consisting of the head chiefs of each of the three provinces, as the tribunals for the trial of issues arising between paramount chiefs, divisional chiefs, and chiefs of the province. The measure did not, however, provide any solution for the indeterminate position which existed as regards native administration. On the judicial side, it did not give the Governor power to vary the schedule of chiefs empowered to hold tribunals, except to include a chief who had proved his claim to be included, nor did it categorically lay down that the power to exercise jurisdiction depended on recognition of the chief by government, or provide for administrative supervision and control over tribunals. On the executive side it made no provision for the introduction of the native treasury system which, as experience has shown, is the most essential feature in indirect rule. The chiefs still depend for their income largely on fines from the native courts and revenue from stool lands. Irregular methods of raising money are

¹ See Chap. XII, p. 776.

² L. P. Mair, *op. cit.*, 1936, p. 163.

resorted to, and dependence on income derived in such ways undermines the position of the chief.¹ The question of the native treasury has for many years been one of the most controversial problems in Gold Coast politics. In 1931 an ordinance was passed² which merely conferred power on a paramount chief to make by-laws establishing treasuries; such by-laws have been passed in very few states. It did not involve any measure of control and would not have established a native treasury system in the sense that is understood elsewhere.³ In the absence of a complete measure of control, there was no guarantee that any part of the stool funds would be spent on public purposes; and in the absence of a direct tax, or any contribution from the state, many of the stools had inadequate resources for financing measures of local improvement. In 1932 the government proposed, in its draft Native Administration Revenue Ordinance, to impose a direct tax in order to augment the funds of the native administration; but the opposition which the Gold Coast has always shown to any measure of direct taxation⁴ was intensified when it was announced that part of the proceeds of the tax would go to the revenue of the central government. Two years later it was decided that if the tax were imposed, no part would be taken by government;⁵ but the opposition continued, and the proposed ordinance was withdrawn. The chiefs have consistently claimed that the native administration treasuries should be financed by grants from the central revenues;⁶ they contend that the export duty on cocoa is a tax in which the native administrations are entitled to share. By an amendment of the Native Administration Ordinance⁷ passed in the legislative council in March 1936 paramount chiefs are, in effect, empowered to impose tribute or levies on their people. The representatives of the provincial councils spoke in favour of the amending Bill during the debate, but some of them were careful to explain that it would not be necessary to apply it, when enacted, to their states, while the others afterwards repudiated all responsi-

⁷ No. 25 of 1936.

bility for the measure. So far no paramount chief has approached government for permission to impose a levy on his people and it seems very unlikely that any will do so. A certain number of native treasuries have been voluntarily constituted by chiefs, and in one case a treasury has been imposed on a spendthrift division by ordinance;¹ but in no instance is there a real treasury in the sense that the whole of the revenue is brought to account and expenditure is governed by approved estimates. It may be noted that on the judicial side Ordinance 18 of 1935 made a material improvement by the grant to administrative officers of authority to supervise native courts, and a restricted authority to review their judgements.

Ashanti is administered apart from the colony by a Chief Commissioner responsible to the Governor of the Gold Coast, and like the Northern Territories the administration forms a significant contrast with the colony, reflecting the periods when its administration was developed. In Ashanti the tradition of respect for native authority has not been unbroken. The powerful confederation under the Asantehene, the title of the head of the Ashanti nation, was dissolved in 1896 after the Ashanti wars, when the territory became a British Protectorate. In 1901 Ashanti was annexed to the Crown and a conscious process of disruption followed; the independent chiefs created during that period were not all men of hereditary position in the tribe. Investigation since 1932 regarding the wishes of the people showed that the great majority were in favour of the restoration of the confederacy, and on January 31, 1935, the restoration was proclaimed under the Asantehene. The tribal organization is more clearly developed than that of the colony, the educated element is smaller, and political influences are not so great; legislation does not require the consent of the legislative council. Thus it was possible in 1924 to provide a Native Jurisdiction Ordinance on the lines followed later in the Colony in 1927 and 1931, and a number of stool treasuries were then constituted.

The restoration of the confederacy involved modifications in the previous system, and for this purpose a new Native Authority Ordinance and Native Courts Ordinance were introduced in 1935.² These ordinances were a step forward in the development

¹ Asamangkese Division Regulation Ordinance 3 of 1935.

² Ordinances 1 and 2 of 1935.

of a system on Nigerian lines, quite apart from the need that had arisen through the restoration. It was thus arranged that the Asantehene presides over a native court of first instance, having jurisdiction over the Kumasi Division only, and a court of appeal consisting of the head chiefs of divisions and clans. The latter court, while it is primarily a court of appeal in land cases from the head chiefs' courts, has also original jurisdiction in land cases arising between chiefs of different divisions. Appeals from head chiefs' courts in suits other than land cases lie to the magistrates' courts. The executive powers of the Asantehene are bound by traditional custom, which requires him to respect the right of independent members of the confederacy; he may form a native treasury, but his powers over natives outside his own division may, except in special cases, only be exercised through the head chief of that division. A Confederacy Council, composed of the head chiefs of the constituted divisions and chiefs of the Kumasi clans was established by the Ashanti Confederacy Council Order of 1935. It is the Supreme Native Authority within the confederacy area and has power to issue orders for specific purposes and to make rules subject to the approval of the Governor. The Asantehene is assisted, in his capacity of head chief of the Kumasi Division, by the Kumasi Council of Chiefs. As these chiefs stay in Kumasi and meet frequently they tend to acquire an undue influence in Ashanti affairs, and to exercise a somewhat arbitrary rule over the areas of hereditary land and the many personal subjects restored to them. The efforts of the administration are directed towards making the divisional and village councils representative of the views of the people and thus strengthening the position of the divisional chiefs as the people's representatives in the confederacy council.

The divisional chiefs have courts more or less according to their importance. District Officers exercise supervision of the courts and can remove cases to their own courts. In particular the handling of cases in which a political flavour is present leaves much to be desired; in other cases the most usual errors are in procedure, a difficulty which is bound to arise where courts from which there is appeal to European courts are required, as in this case, to administer a part of the criminal code; members of

the native court find difficulty in understanding the acquittal on appeal on technical grounds of persons who have unquestionably committed the offences for which they have been convicted. The organization of the political and judicial side is in a more complete state than that of the administrative, and, as in the Colony, it is improbable that much progress can be made in the development of the executive functions of the native authorities until a system is evolved whereby an adequate and regular income can be assured. There is no direct taxation other than by the imposition of levies at the request of the chiefs and elders, and no machinery exists to enforce payment of levies by defaulters. Moreover, levies are rarely applied except for the liquidation of the debts which weigh heavily on most of the stools. The stool revenues are barely sufficient to meet recurrent expenditure; a few stools have received considerable amounts in payments for mining rights or in presents from strangers for the privilege of cultivating stool land, but such revenue, not being recurrent, only helps temporarily to ease the financial situation. Some measure of progress has, however, been effected. The treasuries are obliged to keep banking accounts where a bank exists, and almost all treasuries have accounts at the bank at Kumasi from which withdrawals are impossible without the countersignature of the District Commissioner. The increase of stool debts is kept in check by a native authority treasury rule which requires the consent of the District Commissioner before debts may be contracted. Public audits of stool accounts are held twice yearly under the supervision of District Commissioners. These audits, previously regarded with disfavour by chiefs, since inquiry by the young men was often a preliminary to destoolment, are now welcomed as a safeguard against discontent, and are considered to be of use in removing ignorance of the objects of stool expenditure. It is, however, still the case that suggestions for contributions by way of a levy to a treasury which can show a credit balance are not welcomed by a people who have only been accustomed to contribute in times of crisis or to reduce excessive debts.

Destooling also prevails in Ashanti, but is on the decrease. The Native Authority Ordinance of 1935¹ provides that a chief cannot

¹ No. 1 of 1935.

operate as a native authority until gazetted, but in practice it would be difficult to maintain a 'destooled' chief.

The Northern Territories of the Gold Coast are also administered by a Chief Commissioner under the Governor of the Gold Coast. The administration dates from the proclamation of a protectorate in 1901. The tribal organization in these territories has points of special interest in view of the recent development of a system of indirect rule. The ruling classes in Mamprusi, Dagomba, Gonja, and Wala are not of the same origin as the people: they possessed well-developed ideas of chieftainship and established themselves more by reason of superior intelligence than by force of arms. They did not interfere with the priestly hierarchy, but accorded it a place in the system of government. The previous type of government was patriarchal; legal sanctions were unknown; but the priests controlled the people by threats of punishment to be inflicted supernaturally on offenders. Section 15 of the Administration Ordinance of 1902 illustrates the attitude towards the native authorities which prevailed until 1928. Under this section the chiefs were merely empowered 'to exercise the jurisdiction heretofore exercised by them in the same measure as such jurisdiction has heretofore been exercised'. No steps were taken to define more exactly the extent of this jurisdiction or to give recognition to native tribunals. The chiefs or heads of families continued to settle disputes by arbitration, but a process of tribal disintegration followed, and even those chiefs who had a long tradition of rule found difficulty in maintaining authority. The cohesion of tribes was further weakened by the partition of the territories into districts without regard to tribal boundaries, and by the arbitrary division of tribes by the Anglo-German boundary.

In 1929 suggestions were made for vesting the native tribunals with strictly limited criminal jurisdiction, and a study of the history, constitution, and customs of the people by the district officers provided evidence that the establishment of a system of native administration in certain, if not all, of the divisions would prove less difficult than had been imagined. In conferences attended by chiefs and people, chiefs who had enjoyed independence for over thirty years acknowledged the paramountcy of

their former head chiefs and consented to resume their subordinate positions. District boundaries were modified, and in 1932 were enacted Native Authority, Native Tribunals, and Native Treasuries Ordinances, embodying the principles and following, in a simplified form, the lines of the corresponding legislation in force in Nigeria and Tanganyika. The Native Tribunals Ordinance was repealed by the more comprehensive Native Courts Ordinance of 1935, which provides for the establishment by the Governor of three grades of native courts. A grade A court, which is generally also the native court of appeal, has jurisdiction to hear land disputes and civil suits up to £50, while in criminal actions it may impose a fine of £50 or a sentence of imprisonment not exceeding six months. The jurisdiction of grade B and grade C courts is respectively £25 and £10 in civil suits, and in criminal cases fines of £25 and £5 or sentences of imprisonment not exceeding three months and one month. In 1936 an important step was taken. This was the introduction of direct taxation in the twelve native authority areas into which the Northern Territories and the part of Togoland which falls under the same administration are divided. The ease with which it was introduced is a tribute to the manner in which the reorganization above referred to was carried out. The tax, the proceeds of which are paid wholly and directly into the native treasuries, is, in principle, the commutation of the customary tribute, in labour and in kind, which the people paid to their chief,¹ but its incidence varies in different areas, and in different parts of the same area according to the assessed annual income of an average adult male. As a result principally of the introduction of direct taxation, and to a lesser extent of the more systematic collection of market and other fees, the revenue of the various native administrations increased from £860 in 1933 to nearly £40,000 in 1937. Having funds at their disposal, the native authorities are now in a position to carry out, and are carrying out, some of the functions of local government.

XV. TOGOLAND

For administrative purposes Togoland under British mandate is divided into two sections, the northern being treated as a part of

¹ See Chap. X, p. 586.

the Northern Territories and the southern as a part of the Eastern Province of the Gold' Coast Colony. The German government recognized chiefs in so far as they could be utilized by the government, and allowed them tribunals with limited jurisdiction, head chiefs in civil and criminal cases up to £5 and sub-chiefs up to £2 10s. These powers were at first maintained by the mandatory power, and, as a preliminary to the introduction of a system more in accordance with the modern ideas of indirect rule, investigations into tribal organization and law and a voluntary amalgamation of groups of independent divisions took place. The difference in the systems of administration in the northern and southern sections is reflected in the ordinances defining the powers of the chiefs and their councils. In the northern section the Native Authority, Native Courts, and Native Treasuries Ordinances of the Northern Territories apply, and there more emphasis is laid on the executive authority and responsibility of the chiefs than on their judicial powers. Chiefs are chosen from the members of certain families and selected by the elders if there be more than one candidate; but it is only on appointment by the Governor that they become native authorities and preside over their native courts. As their selection is recognized by the Governor, they enjoy a greater security in tenure of office than tribal custom might otherwise have allowed. In other parts of the north there are native tribunals, and native courts of appeal, with appeal to the District Officer, save in land cases, which go to the Council. Offences against Health Ordinances in the northern section are now tried by native authorities.¹ Direct taxation has been introduced and native treasuries established. Chiefs have been given considerable responsibility in framing their budgets, and take an increasing interest in the provision and maintenance of such social services as education and sanitation. It may be said that in the northern section, where native society has remained comparatively primitive and tribal influences are still strong, and where also conditions approximate to those in the adjoining territories of the Gold Coast, native administrations are being developed with some measure of success.

¹ *Report on the Administration of Togoland under British Mandate for the year 1936*, p. 36, para. 112.

In the southern section the general policy of amalgamating groups to form native states did not represent the restoration of any earlier system of native rule such as existed amongst the majority of Gold Coast tribes; the peoples have no bond of unity apart from their common origin, language, and customs, and groups only united for purposes of defence; under German rule combinations of political groups had been discouraged and disintegration became complete. In 1931 the mandatory power decided to encourage the independent divisions, of which there were no fewer than sixty-nine, to amalgamate and form states of a size and population which would allow of the establishment of local government on a proper basis; and to this end those who joined one or other of the amalgamations were granted authority to hold tribunals with limited rights, a privilege which does not exist in non-amalgamated areas where all cases still go to the District Officer.¹ For this purpose a special Native Administration Ordinance was enacted in 1932 for application only to the southern section. In its general form it resembles the Native Administration Ordinance of the Gold Coast Colony, but with an important difference; it recognizes the principle that the right of jurisdiction flows from the Crown and is not inherent in the chiefs by virtue of their election by the people. Progress towards an organized system of native administration encounters the difficulties which have been described in dealing with the southern areas of the Gold Coast Colony, but the government hopes that the advantages accruing to the peoples of the native states which already have tribunals and treasuries will become apparent. In divisions where soil is suitable for the cultivation of cocoa, and the inhabitants are as a rule well off, authority to exercise jurisdiction is sought after as a means of increasing the importance of the chief and his elders and as a source of revenue. In less favoured districts the inducement to amalgamate is less, and, in the absence of native tribunals, the District Commissioner continues to hear land disputes and deals with the more important legal matters, while small disputes are settled by arbitration. At present only two out of the four states have treasuries and have accepted the principle of levies for specific objects; and in one

¹ Ibid., p. 4, para. 16.

of those (Awatime) little progress has taken place, as the collection of a voluntary levy has not been found possible.

XVI. SIERRA LEONE

The development of native administration in Sierra Leone and the Gambia has certain similarities with the Gold Coast, though the disturbing influence of frequent destooling is absent. Native rulers were at first confirmed in their traditional relationship with their own subjects in a manner that permitted of little effective intervention by the government in their internal affairs, while the absence of native treasuries and the dependence of chiefs on the administration led to stagnation and lack of initiative on their part.

The Colony of Sierra Leone was acquired by the British government by purchase or concession under treaties with the chiefs at various dates from 1807 to 1872; the Protectorate, an area of 26,000 square miles forming the hinterland of the colony, was formed in 1896. With the exception of the urban areas of Freetown and two neighbouring districts, the social organization of the Colony and the Protectorate is the same, the country being divided into chiefdoms owned and administered by their respective tribal authorities. Chiefdom areas vary in size from that of Tambakha Yobanji, 500 square miles in extent, in the Karene District, to that of the Yabai Krim in the Pujehun District, of about twenty square miles. Each chief is independent and equal in status, and any one of them may be called upon to act as an assessor in the settlement of any dispute which the tribal authorities may find themselves unable to settle unaided. The tribal authority is the sole owner of the land within its area, a principle of native custom uniform throughout the territory and embodied in the Protectorate Native Law Ordinance of 1907.¹ The attempted enforcement of the tax imposed under the Protectorate Ordinance of 1896 gave rise to a rebellion in 1898.² Sir David Chalmers in his report on the insurrection considered whether it was desirable that the power of the chiefs should be broken or retained, and concluded that the only practical policy was 'a regulated administration through the chiefs'. Apparently as a result of this report, ordinances were enacted which formed the basis of

¹ See Chap. XII, p. 780.

² See Chap. X, p. 587.

the system of administration existing up to a recent date. These ordinances, the Protectorate Ordinance of 1901, the Protectorate Courts Jurisdiction Ordinance of 1903, the Protectorate Native Law Ordinance of 1905, and finally a consolidating Ordinance of 1933,¹ recognized the authority of the chiefs and defined the jurisdiction of the native tribunals. Their claims to personal services and rights to compel labour for communal purposes were defined by legislation in 1932.²

The chiefs are usually the oldest suitable male members of 'crowning' houses, but occasionally a successful business man contrives to be elected. The chief presides over a tribal authority consisting of his principal men and of section chiefs, who have their own councils; he also presides over the native tribunal. The tribunals have powers to deal according to customary law with all matters which have not been withdrawn from their jurisdiction. Their jurisdiction in civil cases is undefined (with the exception of cases dealing with trading debts), but powers in criminal matters, while allowing fines to an unlimited amount, are restricted to imprisonment up to six months, and sentences of more than fourteen days are referred to the administrative officer. Corporal punishment, rarely used, is an undefined power; appeals against sentences of £2 or £3 are frequent, and reference to the administration and supervision makes the courts timid in applying their powers. Again, courts tend to enforce customs of doubtful value, such as ritual offences or debts incurred by long-deceased relatives of the parties, and also admit the practice of 'begging', whereby an offender may be allowed a reduction of a heavy fine if suitable apologies are made to the chief. Under the present system the tribal authority or assembly, provided for in the Ordinance of 1905, rarely meets in full; chiefs are reluctant to summon it owing to lack of financial resources, distance, and bad communications. The system clearly lacks vitality as a potential organ of local self-government, and the government hopes to improve it by remodelling the authorities and courts on lines more in accord with the accepted principles of indirect rule. A report on the possibilities of such a development³ has been pre-

¹ Protectorates Ordinance, 1933.

² See Chap. XI, pp. 610 and 620.

³ *Sessional Paper* 3 of 1935, pp. 13-15.

pared; it recommends the establishment of native treasuries (into which fines and fees will be paid instead of into the pockets of the chiefs as at present) and more frequent meetings of the tribal authority and consultation by the government. Ordinances bringing these recommendations into effect have now been passed.¹ Only one type of court is considered necessary, with appeal to the District Commissioner; the village headmen's courts are to be continued as courts of arbitration. Revenue for the authorities' treasury will come from a tax of 3s. or 4s. on houses (in lieu of the present system of tribute whereby the chief receives a proportion of the tax) with an additional grant by government of about 2s. a house; from court fees and fines, and from a rebate on the house tax; other sources of revenue will be forestry and land dues, which at present are negligible. A provision of £6,365 was voted by the legislative council in 1938 to enable the reorganization of fifteen chiefdoms in both provinces to be carried out.

XVII. THE GAMBIA

Since before the British occupation, a process of tribal disintegration has been in progress throughout the Gambia owing to slavery, inter-tribal warfare, and migrations; little tribal organization now remains. Administrative districts have been constituted arbitrarily, and the international boundary makes an artificial dividing line between people of the same tribes. The selection of chiefs has not been governed by any old-established rules of heredity, but consideration is paid to the views of the people, and recent policy has been to appoint where possible members of the old kingly families and to amalgamate divisions of tribes to form more satisfactory units for native administration. In 1894 an Ordinance, no. 11, provided for the exercise of jurisdiction by native authorities and by commissioners; and, subject to a repugnancy clause, laid down that native laws and customs in force had the same effect as regulations made under the ordinance. The duties and powers of the native authorities were left vague; and chiefs were, in effect, made agents of the government to suppress disorder, execute laws of the government, and apprehend offenders. The original ordinance was superseded

¹ Ordinances 8, 9, 10, and 11 of 1937.

by an Ordinance of 1913 and this in its turn by Ordinances of 1933.¹ In 1935 these ordinances were consolidated in a triple series of measures,² under which the head chiefs continue to be native authorities, are given power to issue administrative orders, and have duties in connexion with suppression of crime. The native courts are graded A and B, to administer both Native and Mohammedan law; the A courts have jurisdiction up to nine months' imprisonment and civil claims of £50, the B courts up to six months' or in claims of £25. There is no Native Appeal Court, but appeal is to the Commissioner and then to the Supreme Court. Rules of the authorities extend to such matters as the growing of economic crops. Chiefs are appointed for probationary periods and are then confirmed if satisfactory.

Besides their duties as heads of the tribunals, chiefs are responsible for the census on which the yard tax is assessed, and for collection of the 'strange farmers' tax of 8s. a head; infringements of the tax law³ are punishable in the native courts. The chiefs are paid stipends by government, and receive a commission on tax collections amounting to 5 per cent. of the yard tax and 25 per cent. of the strange farmers' tax. The village headmen who collect the tax in the first instance on the chiefs' behalf receive the commission but no stipends. The chiefs' stipends do not exceed £50 a year, but total incomes of the more important chiefs average about £200 a year. There are no native authorities' treasuries; court fees and other fees are paid into a 'Development and Emergency Fund' controlled by the Administrative Officer who consults chiefs about expenditure. The chiefs have no councils. The ordinances of 1935 made some advance towards a more effective system of native administration, but progress is impeded by the lack of chiefs capable of exercising authority and the virtual absence of tribal cohesion.

In the Gambia, Moslems are increasing in numbers, especially among the Jola tribe; their cases are settled under Moslem law in the ordinary native courts, except in Bathurst, where a special court has been established.⁴

XVIII. THE FRENCH TERRITORIES

Reference has been made elsewhere¹ to the operation of that policy of 'assimilation' which, at one stage, was the guiding principle of French colonial policy, and gave to West Africa the four *communes de plein exercice* and the *Conseil Général* of Senegal. In dealing, therefore, with the French policy of native administration it is possible to neglect the small element of *indigènes citoyens*, created through the operation of this policy, and to confine the study to the system applied to the native *sujets* who make up the great bulk of the population. It is usual to speak of the principle which now regulates the relation of the administration to its African subjects as one of 'association'. It is a policy which, for the time being at all events, concentrates attention on the formation of an *élite* to occupy an intermediate position between the native living in customary conditions and the fully assimilated French citizen. The *élite* are not to be viewed only as 'auxiliaries' in the work of administration; they assist also in introducing to Africa that measure of French civilization which can be regarded as suited to African conditions. It is clear that, with such an objective, native institutions are necessarily viewed in a different light from that in which they are seen in the philosophy of indirect rule. It would not be possible for French opinion to subscribe to the view that it is vital 'to direct the energies of the native to the preservation of his own institutions' on the ground that 'we must graft our higher civilization upon the soundly rooted native stock'.² Modern French colonial policy does not condemn these institutions as worthless; it argues that they will repay careful study;³ but the value they possess is to be measured only by reference to the contribution they can make in the process of adapting native society to French ideas and civilization.

French policy has appreciated the need for keeping touch with African opinion, and a detailed account has already been given⁴ of the provision for the representation of Africans in the *conseil de gouvernement* of French West Africa, in the *conseils d'administration* which exist in each of the colonies of French West Africa (except

¹ See Chap. VI, pp. 185 ff.

² See above, p. 432.

³ See Chap. II, p. 44.

⁴ See Chap. VI, pp. 200-2.

Senegal) and in French Equatorial Africa, and in the various local councils, chambers of commerce, and advisory bodies. But it will be clear from the description given that advisory councils of this type are designed to reflect the opinion of the *élite* rather than of the general population; it is, indeed, only of recent years that efforts have been made¹ to constitute village and *canton* councils which will provide the non-educated classes with some means of expressing themselves. It is perhaps true to say that, as a rule, the non-educated African, even if a chief, finds direct access to the administration more difficult than would be the case in most British territories.

An account is also given elsewhere² of the legal system of the French colonies, which makes a clear distinction between *justice française* and *justice indigène*. It is necessary here to recall only two features of that system. The native tribunal is not 'native' in the sense understood elsewhere; it is not the court established by native custom, and the chief and his council have no recognized place in it. Secondly, the procedure of these courts is such as inevitably to bring an increasing pressure to bear on native customary law to conform to French legal conceptions. An account will also be found, in the chapter relating to land, of the French attitude in regard to the African systems of land tenure, and the attempt made to bring them more into conformity with French conceptions of the law of property by introducing some type of individual proprietary right.³ In the chapter on education reference is made to the manner in which educational policy serves the dominant theory of 'association', particularly in regard to the training given to the class which has been described as the *élite*.⁴

In occupying French West and Equatorial Africa the French made treaties with native states and chiefs, recognizing existing native institutions, and in the first stage native administration was to a great extent confined to carrying out these obligations. But the grant of protection, without at the same time making provision for effective regulation, had the usual result; the chiefs were able to abuse their position, and in many cases their rule was in

¹ See below, p. 489.

³ See Chap. XII, pp. 858-62.

² See Chap. VII, pp. 275-7.

⁴ See Chap. XVIII, pp. 1261-70.

effect one of terrorism. Both humanitarian and economic considerations suggested an extension of government control. Confronted with the necessity of either controlling the native kingdoms or substituting a direct form of administration, the French chose the latter alternative. Gradually the provisions of the treaties were put aside and the powers of the chiefs curtailed. The regroupment of native areas and establishment of petty chiefs as agents of the administration and representatives of their people has been, and is still being, carried out throughout all the territories. The government has declined to appoint successors to emirs or superior chiefs on the death of holders of the titles or on their removal for abuses; in Senegal, the Sudan, and Dahomey even the names of old chiefdoms have disappeared; elsewhere and in the mandated territory of the Cameroons the Moslem emirs have been reduced to the status of presidents of a confederation of chiefs (*chefs de cantons*) and their pagan subjects freed from interference.¹ This reorganization was based mainly on ethnical considerations, but economic and even military needs played their part. Thus the emirate of Sine was abolished in 1924 at the death of an emir who, with his people, had been loyal to the French administration; it was held that in the interest of the economic development of the country the inhabitants should not be allowed to follow a separate tradition. Between 1908 and 1912 reorganization took place in the Ivory Coast for military reasons and further reorganization in 1913 for economic reasons; indeed, considerations of economic development must of necessity play an important part in the evolution of a native policy based on a *mise en valeur d'ensemble* in which political, social, and economic development are closely allied.²

The position accorded to native chiefs of the reorganized groups is a compromise between the ideal of a complete assimilation of colonial to home methods of administration and the practical necessity of supplementing a small European staff by the employment of native personnel. The chiefs are, to quote the phrase used in the Cameroons report of 1922, 'executive agents'. The first tendency was for these agents to be chosen purely with regard to

¹ H. Labouret, *Le Cameroun*, 1937, p. 18.

² A. Sarraut, *La mise en valeur des colonies françaises*, 1923, p. 83.

their usefulness to the administration, and in some areas a knowledge of French was a condition of appointment. Office clerks, interpreters, and ex-soldiers were, in many cases, appointed chiefs. As early as 1909, however, misgivings as to the wisdom of this policy were expressed in a circular by the Governor-General of French West Africa, M. W. Ponty. This circular¹ pointed out that the grouping of natives on a purely territorial basis, under a native agent appointed by government, had often resulted in placing the traditional chiefs at the mercy of an individual of alien religion and race, and as a remedy it advocated the use of tribal chiefs. In 1917 the Governor-General, M. Van Vollenhoven, went a step further in declaring that the appointment of traditional native chiefs was indispensable wherever possible as intermediaries between the *Commandant du cercle* and the people, in place of the interpreters, secretaries, or native police who at that time represented French authority. He emphasized, however, that, as there cannot be a division of sovereignty in the administrative district, French authority must remain alone; the chief can act as an agent only. Similar principles were laid down by a later Governor-General in 1921: the destruction of the native social structure is regretted, not because of any conception of its inherent value, but because it could have been improved for the purpose of serving the administration. In 1924 the Governor-General of French Equatorial Africa advocated the reconstruction of native society by the re-establishment of traditional groups. In 1928 we find this policy of selecting hereditary authorities for administrative duties embodied in an *arrêté* affecting the mandated territory of the Cameroons,² whereby new chiefs are nominated by a *mandat* of the administration only after consultation with notables and superior chiefs according to local native custom; but in doubtful cases the administration makes its own choice of the most suitable person. In Dahomey, by an *arrêté* of 1930, village chiefs are to be chosen from a list of three names after an election by the majority of members of the villages, and from these the administrative officer selects one for a period of four years which may be extended indefinitely. A model ordinance by M. Brévié in 1932 provides

¹ Circular of Sept. 22, 1909, *Journal Officiel*, 1909, p. 447.

² H. Labouret, *op. cit.*, p. 20.

simply for the election of a village chief by the majority of the heads of families.

The diversity of conditions over such a vast territory has doubtless led to wide differences in practice, but the official system remains the same. The administrative district is divided into *cantons*, each with its *chef de canton*, who is the superior over *chefs de villages*, chiefs of one or more villages. The grouping of villages into *cantons* is an essential principle of policy, though in many areas, for geographical or ethnical reasons, no suitable cantonal head can be found. In some cases the *chef de village* is the highest native authority recognized. In the Yoko subdivision of the Cameroons, for example, there are thirty village chiefs, each assisted by three or four native *capitas*, but no higher native authorities. In French Equatorial Africa there is an intermediate *chef de tribu* who may also be a *chef de canton* if his group covers a wide enough area. In exceptional cases, such as in the Lake Chad area of the Cameroons, where it has not been thought desirable entirely to suppress emirs who previously held sway over large areas, *chefs supérieurs* are recognized, but the general policy is to keep the intermediaries between the administrative officer and the people as few as possible¹ and to re-group communities within the cantonal system. In communes or urban areas *chefs de quartier* are appointed with the same position as village headmen.

The semi-official status of the chiefs is marked by the manner in which they are remunerated. The majority of village chiefs are responsible for tax collection and receive a percentage which varies at the discretion of the administration.² In some areas, as for example in Senegal, it has been the custom to rank chiefs in grades, the appointment in or promotion to a grade being announced in the *Journal Officiel*. The question of the salaries paid to chiefs has been the subject of frequent discussion in the Colonial Council.

In addition to the collection of taxes a wide range of duties is imposed on the village chiefs. In some areas they keep a register of the population under their control; in the Chad colony they also record the numbers of live stock in connexion with taxation.

¹ J. Brévié, *Circulaires sur la politique et l'administration indigènes en A.O.F.*, 1932, no. 421, p. 54.

² See Chap. X, pp. 589-92 and 599-600.

In French Equatorial Africa there is no general law defining the duties of chiefs or the relation between the different grades. In French West Africa village chiefs are responsible for the maintenance of order and the arrest of criminals, who must at once be handed over to the *chef de canton* and by him to the authorities. Their duties include the prevention of bush fires and of damage by stray animals. They are expected to organize measures to meet crises such as floods or locust invasions, to see to the maintenance of seed-farms and the storage of food reserves. They are also responsible for the upkeep of roads in their areas. They must notify infectious diseases to the canton chief and isolate the cases.

The canton chief is responsible for passing on government orders to the village chiefs under him, and for seeing that they are carried out. He keeps the register of taxpayers, and he, and not the village chief, is the agent of government as regards military conscription. He allots the proportion of taxes or *prestation* labour¹ required of the canton between the constituent villages. He forms a central source of information to government on the matters on which village chiefs are required to report. These chiefs receive fixed salaries, since they are not responsible for tax collection.

The model *arrêté* circulated by M. Brévié² in West Africa introduces the innovation that each chief is to be assisted by an advisory council. The village council is to be constituted in accordance with local custom, but should in principle consist of all heads of families. Its proceedings are subject to the supervision of the canton chief. The canton council is also to be constituted according to native custom, but should in principle include all village chiefs; this provision presupposes a degree of political unity which, as has been mentioned, often does not exist in the cantons as they have been constituted. The provincial chiefs have a council which is either a customary body or consists of all canton chiefs. This proposal, which is described at length in M. Brévié's circular,³ is an attempt to organize a means for the consultation of native opinion. Officials are urged to take an interest in the councils and to make it plain that they do not regard the chief as the only representative

¹ See Chap. XI, pp. 624-6.

² *Arrêté type* (Annexe à la circulaire générale, no. 421 du 28 septembre 1932).

³ J. Brévié, op. cit., pp. 53 ff.

of the general view. The village councils might, with the support of the administration, help to provide some form of popular control over the incidence of obligations, fiscal or other, but they do not in their present form provide a basis for the development of local government. They are given no rule-making power, and, more important, they have no revenues. It appears also that such councils have not become part of the system throughout the whole of the French possessions. In the Cameroons the law makes provision for *conseils de village* whose function is to assist the village chief by giving advice regarding public works and agricultural matters, but does not provide for cantonal councils.¹ A similar system of chiefs and councils was instituted in French Togo.² The more formally constituted local councils have been described in an earlier chapter.³

The French do not publish reports of administrative officers of the type of those which, in British territory, provide valuable information, and frequently also outspoken opinions, about the course of native administration. It is clear that, apart from any question of principle, the French system confers very considerable powers on its *agents*. The abuses committed by chiefs under the earlier system constituted one of the reasons for replacing it by a system of direct administration; that chiefs do not now enjoy so wide a range of licence is patent, but it is not easy to decide the extent to which the supervision now exercised by administrative officers establishes an effective control, or how far a more careful choice of chiefs has resulted in a greater sense of responsibility than existed among the older class of nominees. It is obvious that the quality of supervision varies widely; it is, for instance, far higher in the Cameroons than in most areas of Equatorial Africa, while in many parts of West Africa it is reinforced by the growing intelligence and consciousness of natives themselves. If, however, the British system of indirect rule meets with criticism from some French observers, the British colonial officer is apt on his part to suggest that his French colleagues are so far dependent on the work done by their *agents*, particularly in relation to the programme of increased production, that they cannot afford to be unduly critical

¹ *Arrêté* of Oct. 9, 1935.

² See Chap. VI, pp. 194-206.

³ *Arrêté* of May 6, 1936.

of the methods they employ. The system undoubtedly has great virtues in respect of simplicity of administration and unity of authority; it also appears to avoid the volume of office work which is obvious in British territories, and some of the dangers inherent in a system which grants wide powers to native authorities, for the grant of independent powers to such authorities must always carry its own risk of abuse. These points will, however, be referred to at a later stage in this chapter.¹

XIX. THE BELGIAN CONGO

The Free State employed as agents natives who were frequently alien to the tribes over which they were set; their main duty in a number of areas was in effect to supervise the delivery of rubber. But as early as 1891 the mischief of this system was in some measure realized, and instructions were given that in certain regions recognition was to be given to the traditional chiefdoms.² We are concerned here, however, with the present system of native administration, which has its roots in the reorganization made after the Free State was annexed to Belgium. A Commission of Inquiry of 1904 recommended a type of administration, later embodied in a series of decrees, which has been described as 'le régime de l'administration indirecte, si atténué qu'il soit'.³ In 1906 instructions were given that, although the chiefs to be appointed were to be chosen for their activity and their devotion to the state, their position as traditional authorities must also be taken into consideration, and no tribe should be subjected to a native authority which it does not accept.⁴ At the same time provision was made for the appointment of *messagers indigènes* who would act as intermediaries between the chiefs and the administration. In 1910 a further step was taken, and a decree promulgated which had for its aim the grouping of the native people under traditional authorities who would also be the agents of the government.⁵ The result was the recognition of a large number of petty chiefs, a number which was

¹ See below, pp. 533-5.

² *Décret du Roi-Souverain*, Oct. 6, 1891, article 1; article 6 declares: 'Les chefs indigènes exerceront leur autorité conformément aux us et coutumes.'

⁴ Decree of June 3, 1906.

⁵ Decree of Mar. 2, 1910.

unnecessarily increased by giving independent powers to chiefs who by native custom were merely the subordinates of a paramount. In 1919 the *chefferies* reached their maximum of 6,095.

From that time there has been a reaction in favour of the reduction of the native authorities to a more manageable number. An effort has been made to ascertain the real nature of native political authority, and this has led to the withdrawal of recognition from many chiefs who proved to be merely the subordinates of a paramount. A ministerial circular of 1920 also recommended the policy of grouping small native units into 'sectors' under a council representing all the native authorities in the area, one being selected from among them for appointment as chief. In the Eastern Province 302 sectors were thus created by 1924, with a resulting reduction of several hundred in the number of *chefferies*. Sector tribunals were recognized in 1926,¹ but as a political unit the sector acquired legal status only in the native administration decree of 1933.

The decree of 1933 marks an important stage in the development of the principles of native administration. Under it the customary status of chiefs is unimpaired, but they are no longer to be official intermediaries of the administration,² unless expressly recognized for that purpose. Those who held government appointments at the time the decree came into force are allowed to retain their insignia and draw their salaries subject to the approval of the *commissaire de district*. In 1934 there were 2,552 chiefs and 192 sub-chiefs. There will now be two types of native authority—the chief of a native community, whose customary powers do not depend on government, but who is entrusted by it with administrative duties on its behalf, and the sector chief, who has no customary powers over the sector, but would normally be the chief of one of its constituent communities. The Report of the Colonial Council on the decree describes the native chief as 'une autorité qui, d'une part, participe à l'administration européenne, et est intégrée dans son cadre, et, d'autre part, continue à appartenir à l'organisation indigène. Cette autorité constitue le chaînon entre les deux organisations.'³ He is also 'le mandataire qualifié de la chefferie

¹ Decree of Apr. 15, 1926. ² J. Magotte, *Les circonscriptions indigènes*, 1934, p. 20.

³ *Bulletin Officiel*, 1933, p. 951.

auprès de l'autorité européenne'.¹ M. Magotte,² in his commentary on the decree, states that in the exercise of their governmental duties 'ils agissent comme fonctionnaires et . . . sont, à ce point de vue, placés dans la même situation que toute autorité subordonnée'. The powers of the chief *qua* traditional authority and *qua* emissary of government are to be clearly distinguished. In the former case he is subject only to advice and a possible veto from the administration; in the latter it is he who issues orders to his people, but he must do so at the request of government. In matters not regulated by custom he may only issue orders on his own initiative for the protection of public health and the maintenance of order and public security, and only when such orders have not been issued by superior authority. In the *chefferies* the decree requires the consultation of native councils of notabilities (*conseils de notables*) in important matters such as finance; in the sectors such councils consist of the heads of the constituent group, the members of sector tribunals, and other notabilities chosen by the *commissaire de district*.

The system places considerable importance on the formation of the *circonscription*, the primary unit of native administration. The system of enumeration,³ indeed, has some tendency to stabilize the position of the individual as member of a *circonscription*, as has the control of native movements through the *passéport de mutation*.⁴ Natives are held responsible within their *circonscription* for village hygiene, the construction of dispensaries at the request of the medical authorities, the construction and maintenance of local roads, the building of schools or prisons, burial of the dead, and the cultivation of crops considered by government as of educational value.⁵ For these purposes every able-bodied male may be required to give up to sixty days' labour in each year. The work is not paid from funds provided by the central government, but may be paid from the local native treasury if funds are available; in the case of cultivation the produce must be sold for the benefit of the workers. A programme of all works to be carried out during the year is drawn up by the *commissaire de province* with a view to ensuring that the demands do not involve more than

¹ *Bulletin Officiel*, 1933, p. 951.

³ See Chap. IV, p. 120.

⁴ See Chap. XI, p. 671.

² *Op. cit.*, pp. 107-8.

⁵ *Ibid.*, p. 633.

sixty days' work in a year. In the absence of voluntary labour for work on main roads natives of each *circonscription* can be called on; in this case the work is paid and must not exceed sixty days.

Chiefs receive salaries from government. They are classified as 'mediocre', 'good', or 'very good', and are paid 45, 60, or 90 centimes per taxpayer in their area according to their classification. They also receive a percentage of the tax paid within their area not exceeding 3 per cent. (or 6 per cent. in the case of the more important chiefs). Where they assist in the collection they may receive up to another 3 per cent.

Native treasuries (*caisses des circonscriptions*) also received their first legal recognition in this decree. The customary revenues of chiefs, if the *commissaire de district* so directs, are paid into these treasuries. In return the chief receives a sum provided for in the budget. Their main income is derived from an addition to the poll-tax of not more than 20 per cent., the amount to be fixed for each district after consultation with the native councils. Among other resources are local levies, rents of land, market dues, and court fees and fines. Some mining and commercial companies pay a bonus as compensation for the loss the chief is supposed to incur through the absence of his people at work. The government requires the sum to be paid into the treasury, to discourage abuse in recruiting labour, but a part is eventually paid by the treasury to the chief. This practice of paying bonuses is said to be on the decrease.

The principal objects of expenditure of native treasuries are the purchase of implements, the development of organizations for production, marketing, thrift and mutual assistance, and subsidies to educational and medical work carried on by voluntary bodies. The budget is drawn up under the supervision of the *administrateur territorial*,¹ who can insist on the inclusion of items which he considers necessary, and usually keeps the accounts. Expenditure must be made in the interest of the natives living within the treasury's area, and the administration has powers to insist on expenditure which is considered necessary.

The position accorded to the two sultans of Ruanda and Urundi

¹ See Chap. VI, pp. 243-4.

resembles that of the emirs of Northern Nigeria in the early days of indirect rule. These chiefs, who exercise a quasi-feudal authority similar to that of Hima kingdoms in Uganda, were already recognized by the German administration. Their powers have not been defined in detail; they are authorized to exercise their traditional authority subject to government instructions, conveyed through the medium of the Residents who act as their advisers.¹ Policy has aimed, as in the Congo, at the grouping of subordinate authorities so as to create units of a suitable size for administrative purposes. Customary tributes are maintained, but unauthorized exactions on the part of the subordinate chiefs are punished with dismissal. Incapable subordinate authorities are also dismissed, a successor being appointed with the agreement of the Mwami (Sultan). In 1931 it was decided to remove from office the Mwami of Ruanda on account of his failure to assist in carrying out the government policy of native development; no such difficulties appear to have been encountered with his successor, or with the Mwami of Urundi.

The system above outlined is based on a philosophy which resembles that of Britain rather than that of France, and which in its turn has led to the development in the British colonies of a system of indirect rule as opposed to the more direct type of native administration preferred by the French. There is not in the present policy of the Congo any evidence of an intention to make the introduction of Belgian civilization, or Belgian institutions, the main objective of administration. But it has already been noted elsewhere that the development of much of the administrative organization of the Congo is of recent date, and this in particular applies to the system of native administration. The decree of 1933 involves a gradual change in the treatment of existing *chefferies* and their progressive grouping into sectors. There appears to have been in the past some doubt among local authorities in the Congo as to the value of this development; the sector was informally recognized before 1933 but there was some hesitation in creating these units. It has been contended that they invite conflict between the authority of the traditional chief and that of the sector chief, who, as such, is placed in a position of superiority to other

¹ M. Halewyck de Heusch, *op. cit.*, pp. 49-50.

authorities in the sector. But this feature is not without parallel in some of the British East African colonies, where the process of amalgamation often has the same result. It is perhaps too early to attempt a precise characterization of the Belgian system or to estimate its results; it is proper to say, however, that it bears every evidence of a desire to study native requirements, and, as far as possible, to respect their institutions.

XX. NATIVES IN NON-TRIBAL AREAS

(a) *The Urban Native and 'Detribalization'*

The systems of native administration which have been so far described have been devised primarily with a view to the situation of the pastoral or agricultural populations, resident on their own lands, who still form the majority in every territory. These systems, as will have been seen, have also to be adapted to meet the needs of those mixed bodies of natives who have been drawn by a variety of circumstances from their customary surroundings, but who still live under purely native conditions. Into this class fall the heterogeneous groups found in some of the coastal areas of East Africa, or, again, the population of some parts of the Victoria division of the British Cameroons, where, apart from the large collection of labourers living on the plantations, there are many strangers from the French territory and Calabar men engaged in fishing.¹ Typical again of such mixed groups are the 'stranger' residents of the Sabon Gari at Kano,² which has been brought into being by the economic development of a purely native city, or the settlements in the Belgian Congo of soldiers discharged at the end of their seven years' service in the militia. In such cases the problems which arise are due to difficulties in finding a common basis of custom on which institutions can be based.

There is another problem of native administration which is of continually increasing importance and greater complexity—that of the natives who live more or less permanently in industrial areas under European control, or in urban locations near European towns. Populations of this type have developed in a variety of

¹ *British Cameroons, Annual Report, 1936*, p. 16.

² M. Perham, *Native Administration in Nigeria, 1937*, p. 101. See below, pp. 521-2.

different circumstances. There are, in the first place, the employeess of large European enterprises, to whose conditions reference is made in the chapter relating to labour problems.¹ The degree of permanency in the composition of such groups varies with the policy of the employer, which depends partly on the distance from which the labour has to come. In the Rand mines the average term of employment is about one year at a time. In the mines of the Gold Coast much of the labour comes from the neighbourhood and is on short contract, so that the problems connected with a resident population are not acute; the question of providing accommodation for the wives and children of the employees is, however, beginning to arise in some of the larger mines. There is a comparatively small resident population at the Nigerian tin-mines. On the other hand, there is now a considerable resident population in the copperbelt of Northern Rhodesia,² where of late years increasing provision has been made for the families of employees. The Katanga coppermines and some of the Congo goldmines³ seek to encourage the growth of a permanently established native population under the control of the mine management, in the hope that, in the course of time, all the labour required will be available on the spot.

Where the population consists chiefly of male labour working for short periods, the problems arising are mostly those connected with welfare conditions; the task of control and supervision is comparatively simple, and is largely left to the employer, subject to inspection on behalf of government. More difficult problems are encountered in areas where the employees are permanently established with their families, for there an obligation arises for the discharge of responsibilities, both in the field of judicial regulation and the satisfaction of social needs created by the special conditions of these populations. They are, however, rendered easier of solution by the fact that the residents are engaged in one type of occupation and are under the industrial control of a single employer. Far more complex are the problems of the urbanized native group which has grown up out of mere proximity to a European centre, and has not even the homogeneity that arises from common employment. Here are found shop assistants,

¹ See Chap. XI, p. 672.

² Ibid., p. 675.

³ Ibid., p. 681.

garage mechanics, unskilled labourers, persons making a livelihood from such new trades as the existence of the group provides, such as letting lodgings or trading, where this is allowed, and the margin of unemployed which the organization of modern industry seems inevitably to involve. These groups are not linked up with any one economic enterprise, and their administration must be a matter of general policy. Adequate housing, education, medical services, and facilities for recreation are regarded in Europe as social services essential in every urban centre, but African administrations have not all been equally ready to accept responsibility for making such provision. All these groups are, again, alike in the fact that their members do not accept any common code of ethics or system of law; yet this does not mean, as was too readily assumed in assimilationist theories of a generation ago, that they have so far cast off the shackles of tradition that they may be expected henceforth to live in accordance with the principles of European civilization. That assumption was the basis of the *immatriculation* procedure provided by the Congo Free State, whereby natives might be registered as subject to European law—a procedure which modern authorities in the Congo are not eager to popularize.¹

The fact that in many ways these populations have inevitably departed from the manners and practices of their ancestors has led to their being generally described as 'detribalized'. The term is widely used in discussions on African questions, and is conspicuous for the variety of implications it carries. It is sometimes assumed that there are two distinct categories of native society, the 'tribal' (or even 'tribalized') and the 'detribalized'. To those who attach importance to the tribe or group organization as the source of social standards and as providing the sanctions for social behaviour, any African who leaves that organization is liable to be considered as falling, in greater or less degree, into the category of the 'detribalized' or *déraciné*, and, in this condition, to be deprived of the standards of conduct which have hitherto been his guide in life. There are also those who believe that the African, when once he has passed out of the 'tribal' condition, should be regarded as having abandoned his African mode of life for one more closely

¹ See Chap. VII, pp. 277-8.

resembling that of the European. The reality is far less simple. If the use of the term is intended to divide the native population of Africa into those who are and those who are not europeanized, it merely introduces a false simplicity into a complex situation. Educated Africans by no means always dissociate themselves from their tribal allegiances; indeed, on the Gold Coast educated men proudly acknowledge membership of native stools.¹ Both inside and outside tribal territory an indefinite gradation of reactions to European influences can be observed; in the Transkei we find the African doctor, a University graduate, living in close touch with his own people, though doubtless with different material standards, while in the urban locations we see the unskilled labourer who, born and brought up there, still pays the bride-price for his wife, and would slaughter an ox on the appropriate ceremonial occasions if sanitary regulations did not prevent it. It is again noticeable that families to whom some mining enterprises offer inducements to settle down and found a permanent industrial population, and who work at the mines for years, appear to retain their traditional relations with their chiefs during their absence at the mines, and return home in their old age. If there is any unequivocal sense in which the term could be used, it would be applied to those natives who have lived for some generations in urban centres, have no close connexions with their tribal society, and cannot make good any claim to land in its territory. It will be desirable, when dealing in the following pages with the native in urban centres, to give a general description of the conditions in which he lives, without attempting to discriminate between those who are in greater or less measure 'detribalized'.

(b) *South Africa*

It is not necessary for the present purpose to dwell on the situation created by the very large number of natives, amounting now to over 300,000, who live in the compounds of the Rand mining area. As shown elsewhere, they present special problems of their own;² our concern here is rather with the general problems arising from the growth of African populations as part of, or in the neighbourhood of, European residential or industrial towns. These

¹ E. H. Brookes, *op. cit.*, 1934, chap. vi.

² See Chap. XI, pp. 672-4.

problems have assumed increased importance owing to the action taken in recent years to implement the policy of territorial segregation. This implies in principle that no natives will reside outside the areas scheduled for their occupation except those in the employment of Europeans, or handicraft workers and others essential to the needs of resident natives; but though the growth of a permanently resident native population in the urban areas has always been regarded as undesirable, it has now been proved inevitable, and the aim of policy is to restrict the numbers as closely as possible. The insanitary conditions in which such populations lived in some of the larger towns of the Union were the subject of comment by successive commissions of inquiry from 1903 onwards, though action was not taken till the high death-rate among them in the influenza epidemic of 1918 had made a profound impression on public opinion. In 1921 the census revealed that, in the decade from 1911, the number of native women in urban areas had increased by 50 per cent. as compared with an increase of only 7 per cent. in the male population, a development which was held to indicate the extent to which the permanent resident in the urban area was taking the place of the migrant labourer.¹ By 1936 the urban native population was over 1,000,000, approximately one-fifth of the total native population of the Union, the number of women in urban areas having more than doubled since the preceding census; of the total number, only some 300,000 were registered at the end of 1935 as employed in mines and works.² A recent survey of forty-one towns, with a total native population of 537,284, showed that, of this number, 72 per cent. had no intention of returning to the native areas.³

The aim of the Natives (Urban Areas) Act introduced in 1923, with its subsequent amendments, has been to provide satisfactory accommodation for native urban populations in separate areas and at the same time to limit the numbers resident. These measures apply, upon proclamation, to all urban natives except those who are allowed to reside on their employers' premises, the employees of large enterprises which undertake responsibility for

¹ J. F. W. Grosskopf, *Weltwirtschaftliches Archiv*, vol. xxxviii, p. 430.

² *Official Year Book of the Union of South Africa*, 1934-5, p. 1014.

³ *Report of the Interdepartmental Committee on Native Education*, 1935-6, U.G. 29, 1936, para. 454.

the provision of housing for the labourers, and certain classes specifically exempted. Every municipality is required to set aside land, known as a location, for native occupation and to provide housing on a plan approved by the Ministry. Employers of natives who do not make other provision may be required to provide or hire approved accommodation for their employees in these locations. The Governor-General may, by proclamation, prohibit the residence of unexempted natives outside their approved locations, if suitable accommodation has been provided in them. Section 12 of the Act empowers municipal authorities in areas proclaimed for the purpose to take measures to control the entry and residence of natives within their boundaries. The measures generally adopted are that every male native entering such an area must report for registration and obtain a visitor's permit or a permit to seek work, and that he must be registered, a fee being charged for registration; and that a native who does not find employment within a prescribed period may be ordered to leave the urban area, though this period may be extended by the administrative officer. Under an amendment introduced in 1930 the entry of women may be prohibited, except in the case of a woman whose husband or father has resided in the urban area for two years and for whom suitable accommodation is available. This rule is not enforced with any success, as women do not carry passes and their movements cannot be easily checked. Natives adjudged by a magistrate to be idle, dissolute or disorderly, habitually unemployed or without honest means of livelihood, may be summarily removed to their homes or to a labour colony. The law exempts certain classes of natives from registration—namely, Cape voters and persons exempted from native law, registered owners of urban property, approved chiefs and headmen, and approved ministers, teachers, and interpreters.

A further amendment of 1930 provided that in urban areas specially proclaimed the entry of natives might be prohibited altogether, except in accordance with prescribed conditions. By March 1935 nine areas had been so proclaimed. A recent measure has proposed to go much further in this direction. The Native Laws Amendment Act of 1937¹ provides that the municipal

¹ See Chap. XI, p. 665.

authorities may be required by the Union government to introduce measures for controlling the entry of natives which are much stricter than those of section 12 of the Act of 1923 as amended in 1930. Under the Act of 1937 permission to enter a proclaimed area may be refused if there is already a surplus of labour available; employers, other than mining companies, seeking to introduce natives into the urban area must obtain permission and must repatriate them at the termination of their employment. Every two years the municipal authorities must render reports to the Minister for Native Affairs, showing the numbers and occupation of the natives resident within the urban areas, the numbers estimated as necessary for reasonable labour requirements, and the surplus which the urban local authority desires to have removed. In areas proclaimed for the purpose the Minister may require the removal of surplus natives, specifying the individuals to be removed. Apart from the obvious hardship of eviction, the Act would seem likely to involve great practical difficulty in calculating the amount of labour required; the process of choosing the individuals to be ejected lays itself open to obvious abuse. Moreover, it is clear that the Act has a wider implication than a mere restriction of the numbers of natives in town areas; its objective is to prevent the growth of a stabilized native urban population. It makes it a criminal offence for a native to acquire land in an urban area (including a location) otherwise than from a native already holding rights therein. Again, it strengthens the 1930 provision regarding the entry of women: the certificate of residence may be cancelled at a month's notice.

The maintenance of the location is provided for by the local authority out of a separate Native Revenue Account, into which all income derived from the locations is paid. The main sources of revenue are rents and fines; special grants may be made from general municipal revenues. The only statutory contribution of the European taxpayer to location funds is the fee, usually of about 1s. a month, paid by employers for each service contract, a charge which in the absence of a minimum wage can be shifted to the employee. In the Transvaal, however, the fee is collected by the administration and paid into the provincial council funds. Some local authorities make up annual deficits in the Native Revenue

Accounts. In Bloemfontein in 1933 a deficit in the fund created by an extension of sanitary services was met by an increase of 6*d.* per month in stand fees and 6*d.* per month in lodgers' fees.¹ In Natal the Native Revenue Account derives a large income from municipal beer and trading monopolies.

Whatever views may be entertained as to the policy underlying the original Act of 1923, it will have been seen that it contained one provision of great advantage to urban natives—that which laid on local authorities the obligation to supply adequate accommodation for those natives whose residence in or near the urban centre was held to be desirable. Up to the end of 1932 Johannesburg had expended £1,100,000, Capetown £300,000, and Durban £170,000 on the improvement of native housing.² By the end of 1936 the Union government had authorized, under the Housing Act of 1920, loans totalling £1,537,666 for non-European housing schemes to various municipalities; of these £503,467 was for subsidized housing.³ On January 24, 1937, it was announced that the government intended to make at least £4,000,000 available to local authorities for housing improvements, but the proportion in which this will be distributed between the European and native population was not stated. The municipal authorities either themselves construct the houses in the new locations and rent them to natives, as has been done at Johannesburg, or make advances to natives for the purchase of materials with which they build their own houses, repaying the loans by instalments added to the site-rent; this is the policy of Bloemfontein, Kroonstad, and Uitenhage. In the former case the effect of the colour-bar policy, directly through the employment of 'civilized' labour, indirectly through the purchase of materials in whose production the colour bar has been applied, has meant that the cost of building has been so great that a rent sufficient to yield an economic return is beyond the means of the native tenant; the provision of adequate housing then becomes a drain on general municipal revenue to an extent which tends to deter the local authorities from making any further provision.⁴ It was estimated by a member of the Central Housing

¹ Evidence of Mr. J. R. Cooper to Industrial Legislation Commission (unpublished).

⁴ *Report of the Native Economic Commission*, 1930-2, U.G. 22, 1932, para. 506.

Board that a three-roomed dwelling is the best type of accommodation that most municipalities can provide at an economic rent, whatever the size of the family to be housed, this estimate being based on the assumption, generally made in connexion with these schemes, that a fair rent represents one-quarter of the tenant's wage. On the recommendations of a conference on slum clearance held in Capetown in January 1936, it was decided to reduce the interest rate on loans for subsidized housing schemes to $\frac{3}{4}$ per cent. In these schemes the local authority is required to forgo $2\frac{1}{2}$ per cent. of the economic rental, while the Union government contributes a further $2\frac{1}{2}$ per cent. A number of municipalities have objected that even this is a heavy charge.¹ It would appear that the burden of the subsidy is the principal obstacle to the development of social amenities in these areas; Bloemfontein was described in 1935 as 'the only centre where rentals for native dwellings come within economic reach of the natives' wages'.²

In some of the new locations the standard of housing is high. In Port Elizabeth electric light is provided in all houses, while in Durban, though the sole provision for married couples consists of 120 cottages, these have electric light and water laid on. At Bloemfontein the native residents have themselves erected houses of a very good type, and are noticeably 'house-proud'; here areas have been set aside for garden allotments, and the conditions generally are among the best in the Union, a result to which the declaration of a minimum wage for natives in this area³ has possibly contributed. In Pietermaritzburg and the Bantuli location, Pretoria, the houses have gardens, and in Langa Native Township, Capetown, the Native Economic Commission stated that the type of house would attract European tenants. This, however, is clearly not true of the Capetown bachelor quarters, with their concrete beds; and 1,403 of these have never been occupied.⁴ Johannesburg has two sets of such quarters, the Wemmer and Wolhuter Hostels, with iron beds, hot and cold water, and facilities for cooking. In the Wolhuter buildings an attempt to meet the needs of educated men is made by providing rooms to be shared by

¹ *Race Relations*, vol. iv, no. i, 1937, pp. 29-30.

⁴ Minutes of Cape Town Municipal Council (unpublished).

two lodgers only, but the usual complement of a room is ten. In spite of the large accommodation provided in the hostels, they are overcrowded. Even public rooms are filled with beds to relieve pressure. Johannesburg has opened a new location, the Orlando Native Village, which is described by the Central Housing Board as 'a self-contained model native township with schools, parks, recreation hall, hospital, churches, shops owned and run solely by natives, administrative buildings and a railway station';¹ most of these amenities have, however, yet to be created.

The Native Economic Commission visited the native locations of the nine principal towns of the Union, and their report gives a brief description of each.² They note the lack of amenities provided for recreation; in the large locations there is an area available for sport, but it is frequently a mixed blessing, since the dust created by a concourse of people causes serious discomfort to the surrounding houses. Johannesburg, Port Elizabeth, Kimberley, Pietermaritzburg, and Durban have municipal recreation halls, the two last named using the beer halls for this purpose; in Bloemfontein a full-time native welfare officer has his head-quarters in a recreation or community hall which is maintained by the Town Council; in Pretoria a hall has been privately donated to the location natives. Johannesburg has recently opened a swimming-bath.³

Schools run by missionary bodies are found in both large and small locations. Except in the case of small schools which do not conform to any standard, the work is subsidized by the Provincial Education Departments in so far as the teachers' salaries are paid. The buildings are often inadequate and the equipment insufficient.⁴ Public hospitals in the Union have native sections in which attention is given free of charge in almost all cases. At Johannesburg a non-European hospital has 300 beds for natives, though there are usually more than this number receiving attention; Bloemfontein, Pietermaritzburg, and Pretoria finance provision for natives in municipal hospitals; other hospitals provide attention in out-patient departments. Bloemfontein maintains a dispensary with a full-time European doctor in charge, and a child

¹ *Report*, op. cit., U.G. 18, 1936, p. 8.

² *Op. cit.*, U.G. 22, 1932, pp. 65 ff.

⁴ *Report of the Interdepartmental Committee on Native Education*, 1935-6, p. 74.

welfare clinic with a staff of three native nurses. Kimberley has two dispensaries with child welfare centres under qualified European nurses in two of its three locations. In the Pretoria locations a Health Officer conducts a daily dispensary for children; the Johannesburg locations are visited by a doctor three times a week, and two trained native nurses are permanently resident in each village. Pietermaritzburg employs one native midwife, Port Elizabeth one native nurse, Pretoria a coloured midwife and native nurses. In many of these cases the provision of health establishments is obviously on a small scale.

In the Orange Free State native trading is not encouraged; the Municipal Association for that province in 1932 expressed the opinion that 'the native is permitted to be in urban locations only for the convenience of the European employer and no trading facilities may be granted to him',¹ and this policy is still adhered to. On the other hand, although trading licences are not granted, hawkers' licences and licences to deal in foodstuffs are allowed. In the other provinces, especially where Indian trading takes place, many local authorities actively encourage native trading; there the difficulties in the way of native commercial enterprise may be said to lie rather in the native peoples' preference for dealing with the more experienced non-native trader than in official discouragement. In Pretoria, and in other locations such as the Langa Township and the Orlando Native Village, trading is restricted to natives, and the local authority often owns shops which are hired to natives. Licences, however, tend to be granted mainly for the sale of food. In the Western Native Township a co-operative store, opened in 1931, is a new venture in native trading. The previous policy of prohibition of the brewing of native beer in the Transvaal has been considerably modified by the Native Laws Amendment Act of 1937. This Act prescribes that, if beer is not supplied through a municipal beer hall or by natives allowed to brew and sell, domestic brewing shall be allowed;² all the towns on the Reef have applied for, and are being granted, a monopoly to brew and sell beer. In Johannesburg itself the municipality has decided to erect municipal canteens, not as yet in the locations,

¹ *Report of the Native Affairs Commission, 1932-3, U.G. 3, 1934, p. 5.*

² See sections xix, xx, and xxi.

but to cater for the men living in the hostels or resident as domestic servants in the suburbs. The conditions prevailing under what was virtually prohibition were not satisfactory; in most locations beer is brewed and sold,¹ and the enforcement of the law resulted in police raids and prosecutions which in 1936 totalled over 70,000.² In the Free State it was usually permitted to private persons to brew subject to licence, while in the Cape this system and prohibition were equally prevalent.³

The facts regarding the authorized locations have been given in some detail, for, whatever drawbacks some of them may have, they still represent an attempt to discharge the obligation to provide accommodation for the native urban population. But these locations are limited both in size and number. To some extent the standard of building adopted has, in itself, prevented its extension; it is at all events the fact that a large population continues to live outside the locations in most unsatisfactory conditions and often in slum areas. The condition of most of the slum areas can only be described as deplorable, and the government has admitted the urgent need for improvement. An Elimination of Slums Act, passed in 1934, increased the powers of local authorities to order the demolition of insanitary premises, and was applied from the date of its promulgation to eight of the large municipalities of the Union. A study of the existing situation in these centres was made at the end of 1935 on behalf of the Union Housing Board. In Durban at least 30,000 non-Europeans, nearly half of whom were natives, were reported to be living in 'primitive insanitary shacks'.⁴ In East London, in 1935, 20,000 non-Europeans were living in peculiarly insanitary conditions out of a total non-European population of 25,368. Johannesburg had established by 1936 four native villages with a total population of some 54,000.⁵ The population of Orlando Native Township was 12,000 in 1935, and is expected to amount to 60,000 by 1940; the maximum contemplated is 80,000. It is estimated that 9,000 more dwellings for natives are required, and the municipal authorities consider that the need is too urgent to allow of their construction by native labour. In

⁵ *Municipal Native Affairs Department Report*, 1936.

Pietermaritzburg satisfactory housing is available for such natives as remain within the municipal boundaries, but only because of a drastic reduction in their numbers by expulsion, as a result of which 'large numbers of families are squatting in rack-rented shacks on privately owned Indian and other freehold land'.¹ In Pretoria the three native locations in 1930 had a population of 9,663, while the total native population in 1936 was 34,334. It must, however, be remembered that some of those included in the numbers of total population live outside the locations in small huts or in rooms on their employers' premises or in compounds maintained by businesses and industries; in many cases this accommodation is superior to that provided by the municipalities.

Other considerations besides actual lack of accommodation militate against the transfer of natives from the slum areas. The new locations are, in most cases, farther from the natives' place of employment, so that both the time and the cost of travelling are increased; indeed, Durban and Johannesburg have recognized the necessity of meeting this by reductions in the rents charged. Residents in the new locations are debarred from a number of subsidiary sources of income, some legitimate, others not, which are open to the slum dweller. The number of lodgers is controlled, though in practice this control is often evaded,² and it is said that in at least one of the locations, Bantule in Pretoria, some 50 per cent. of the houses are occupied by more than one family. Illicit beer-brewing is more profitable in the slums, since the clientele is closer at hand and the practice less easily detected.³ It is indeed clear that the attempt to improve the standard of native housing cannot be fully effective so long as general economic conditions render life at the new standard difficult for the great majority of natives.

Subject to the financial control of the Department of Native Affairs, the administration of the locations is in the hands of the local authorities. Some of the large municipalities have their own Native Affairs Departments, whose officers in many cases give evidence of having been selected for their knowledge of the special problems with which they are confronted. Consultation

¹ *Report*, op. cit., U.G. 18, 1936, p. 8.

² *Race Relations*, vol. iv, no. 1, 1937, p. 28.

of native opinion is provided to a limited extent through the creation of native advisory boards, consisting of not less than three native members, with a chairman who may be a European and is usually the location superintendent; in Johannesburg and in other centres this official is *ex-officio* chairman; their members may be either elected or nominated. The presence of the location superintendent is the subject of criticism by natives, who feel that it hampers the free expression of grievances. The functions of these boards are at present purely consultative; but by extending their powers and responsibilities, as for instance in the oversight of roads or the control of sanitary services, it might be possible to develop them as organs of native self-government. Experience has shown, too, that sympathetic European chairmen can use the good offices of these boards for a variety of purposes in which the interests of natives are concerned; while they can be relied on to explain to the general population the object of local regulations, and to bring before the authorities demands for additional services and complaints of other kinds. The advisory boards now elect, on behalf of their locations, a senator under the Representation of Natives Act,¹ a provision which has added importance to their status.

Since it is a principle of South African policy that only natives living under tribal conditions shall be subject to the jurisdiction of native courts,² the urban populations are subject in all criminal matters to the European code, and in civil matters their cases are tried by courts with which the application of native law is discretionary.³ The legal problem is in some measure mitigated by the fact that native standards of conduct in the larger urban areas show signs of a gradual adoption of European observances; monogamy is accepted as the usual pattern of urban marriage, and tribal customs of marriage and inheritance tend to become modified or disappear. In the absence of any recognized native authority, the responsibility for the maintenance of order rests upon the European magistrates and police, and it is achieved largely by regulations restricting individual freedom of action. Control, in effect, rests upon the system of registration of all native inhabitants, the pass system, whose operation is discussed elsewhere,⁴ and

¹ See Chap. VI, p. 152.

³ See Chap. VII, p. 283.

² H. Rogers, *op. cit.*, p. 231.

⁴ See Chap. XI, pp. 664-72.

the use of the wide authority given to expel natives from the locations. Curfew regulations, the right of the superintendents to enter premises at any time, to exclude undesirable visitors, to limit the length of visits, or prohibit entertainments, are other characteristic features of the system. There are not wanting instances of authorities who seek to rely upon co-operation with native opinion rather than on the use of these powers, which, however, remain the legal basis of urban native administration.

(c) South-West Africa

In South-West Africa Proclamation no. 34 of 1924 provides for the establishment and control of native locations in urban areas. Locations have been established in the six municipalities of the territory. Only natives may reside or carry on business in these locations. Revenues received from natives residing in the location, also pass fees collected from employers, are spent on the improvement of the location. At Walvis Bay £6,000 was spent in 1924 on buildings and sanitation in the location controlled by the administration. The proclamation provides for the establishment of advisory boards, consisting of not less than three natives resident in the area of jurisdiction of a local authority, to advise upon the management of the location; no location regulations may be made or withdrawn without consultation of the board. The sale of Kaffir beer is controlled in urban areas, and profits from this source are also devoted to the improvement of locations.

(d) Southern Rhodesia

In Southern Rhodesia the position of the native in urban areas has only of recent years presented itself as a problem. Though the average numbers in industrial employment in 1934 were 79,116 indigenous and 104,963 non-indigenous Africans, the Chief Native Commissioner's report for that year estimated the number permanently resident in both mining and urban areas at only 6,906. Of this number, the proportion resident in the urban centres is small, though in certain cases settlements, so far brought under no regular system, have grown up at a short distance from them, and are beginning to present the usual problems. The

Native Urban Locations Ordinance of 1906 empowered the administration to establish native locations and require the residence of natives in them, to introduce a registration system and pass and curfew regulations, and to impose conditions on the entry of visitors. Under this law the government undertakes responsibility for the provision of housing, and dwellings other than those provided by government may not be occupied without written consent.

Native locations have been constructed at Salisbury and Bulawayo. In the former there are some 1,000 rooms, with a population of between 4,000 and 5,000; the cottages were constructed by white labour, and the rent, 11s. a room monthly, is high; the residents are either better-paid natives or those who can take in numerous lodgers. Quarters are provided for unmarried men, where a room can be shared by four at a cost of 2s. 9d. a month to each person. Both the locations appear to be overcrowded. There is as yet no advisory body appointed. For some time little action was taken under the sections of the Ordinance of 1906 which provide for the restriction of entry of natives into urban areas, but a recent law, the Native Registration Act, 1936, applies a more extended system of control to the entry and residence of natives in such areas. Natives entering proclaimed townships to visit or to seek work must obtain a pass, which may be refused for prescribed reasons; provision is made for the erection of hostels to furnish temporary accommodation for such natives as are not allowed to find lodging on native premises. The Land Commission of 1925¹ recommended that native village settlements, of a semi-rural type, should be provided in the neighbourhood of the large towns, a measure which would seem to recognize the existence of a stabilized non-rural population; so far one such village has been created in the vicinity of Bulawayo,² and another will be built near Salisbury. The Native Urban Locations Ordinance prohibits the sale of intoxicating liquor, and the sale and brewing of Kaffir beer is, in the larger locations, confined to beer halls controlled by the local authorities. Since native local government institutions here are relatively undeveloped, the anomaly presented by these mixed populations in territories where traditional native

¹ *Report*, C.S.R. 3, 1926, paras. 384-90.

² *Native Land Board Report*, 1936, C.S.R. 24, 1936, pp. 7 and 8.

authorities have been endowed with extensive powers does not arise; the impending recognition of native courts will raise the question whether any counterpart to them should be devised in the urban centres, or whether the administration of justice should there be left in the hands of European magistrates.

(e) *Northern Rhodesia*

In Northern Rhodesia there are urban populations of mixed tribes in the municipal compounds at Livingstone and Ndola; and in the compounds at Lusaka, Broken Hill, Luanshya, and elsewhere there are considerable numbers of natives, domestic servants, and employees of industries and stores, living on their employers' stands, often with their wives and children. No figures are available, but the total native urban population, exclusive of mine employees, cannot be far from 30,000, of which the old and the new Ndola locations alone house about 3,000. The majority of these people are temporary residents and are likely to return to the rural areas.

The management of native locations is controlled by regulations under the Municipal Corporation Ordinance of 1927 as amended in 1929 and, in the case of the areas other than municipal, by the Townships Ordinance of 1929. Both municipalities and townships erect houses or lease plots on which the occupier builds his own house. The location superintendent may for any reason give an occupier a month's notice to quit; but compensation must be given for buildings which he has erected, and he may appeal against the order. Trading rights are not at present regulated.

In many of these locations housing conditions are far from satisfactory; the natives often live in insanitary huts erected by themselves on plots leased from the local authority, and subletting causes overcrowding. In the larger locations, however, some effort has been made in recent years to improve conditions. At Ndola an insanitary location is being replaced with brick huts rented to natives and to employers for their native staff. Rents are as high as 7s. 6d. a month for married quarters, and although employers are obliged by law¹ to provide housing, the burden of payment often falls on the native himself. There is a

¹ The Employment of Natives Ordinance, *Laws*, cap. 62, sect. 45.

public hall, also a well-equipped government native hospital at some distance from the location, and a government school staffed by a European education officer and native teachers. Good progress is being made in replacing the present Lusaka Township location, which is poorly built and inadequately supplied with water. But it has so far been found impossible to provide adequate housing at an economic rent.¹ The hospitals at Livingstone and Ndola are good. That at Lusaka is to be rebuilt.

In most of the compounds tribal elders assist the compound superintendent in a purely advisory capacity. These elders had in some cases assumed a quasi-judicial role and sat as an informal court, but a move towards forming native authorities and courts from among them has been stopped. The newly formed native Industrial Labour Board considered the advisability of setting up a central native authority whose function would be to formulate a common customary law in cases of conflict, and suggested that native courts with civil and criminal powers should be established, their members being selected by the District Officer after consultation with the local population. Particular importance was attached to the grant of criminal powers on the ground that this would counteract the existing tendency for native administration in the mining and urban areas to fall largely into the hands of the police. The appointment of such authorities was also recommended by Sir Alan Pim.² However, the practical difficulties in the way of forming native authorities and courts among mixed tribes or among people who are in employment and subject to municipal, township, and mining rules have been considered insuperable for the time being.

The unsuitable conditions of the existing locations, both old and new, has led the government to consider the formation of 'African towns' or locations on the lines of a native village at some distance from the European townships. A small model African village was established at Lusaka in 1936, but the desire of employers to have their labourers close at hand, and the reluctance of the native, with his experience of industrial fluctuations, to sink his savings in building, have hampered the formation of such towns elsewhere.

¹ *Report on the Economic and Financial Position of Northern Rhodesia*, Colonial 145, p. 204.

² *Ibid.*, p. 208.

The Industrial Labour Advisory Board advocated the formation of these towns not only to relieve housing difficulties but also to provide opportunities for the development of local self-government in urban areas, by the formation of a native authority composed of a council nominated among the inhabitants, a system which would resemble that of the Belgian *centres extra-coutumiers*. Such a council was set up in 1936 for the African village at Lusaka.

A different problem is created by the large populations living in the locations of the mining companies on the copper belt and at Broken Hill.¹ Fifteen thousand men are employed in this industry and are housed free of rent in huts or rows of rooms; as the companies encourage the residence of a growing proportion of the employees' families, conditions differ considerably from those in the South African mines, where provision is made for unmarried workers only. The number of married employees in the mines tends to increase, and a recent return shows that at the Roan Antelope mine 52 per cent. of the employees were married and the average service was nearly two years.² At Broken Hill the mining company has allowed long-term employees to settle on plots of land on which they are able to keep gardens; at the Roan Antelope mine married employees were given land to cultivate, and extensive gardens were made, though by hired labour rather than by the employees' families as was originally intended; these, however, have now been reorganized to stop cultivation by hired labour. There are now only 203 as against 1,086 previously. The majority of employees live under 'compound' conditions.

The standard of housing is high, and the workers' 'lines' are generally well laid out; there is, as described elsewhere,³ a very adequate provision of health and welfare services. The compounds are in charge of managers; appointed by the companies, subject to the approval of government; on their character and experience much of the wellbeing and contentment of the workers depend. It is clear, however, that much of the detailed management rests with the mine police, though efforts have been made to obviate this by giving the managers the assistance of tribal elders at the

¹ See Chap. XI, p. 675.

² F. Spearpoint, 'The African Native and the Rhodesian Copper Mines', Supplement to the *Journal of the Royal African Society*, vol. xxxvi, no. cxliv, 1937, p. 53.

³ See Chap. XI, p. 675.

mines. Tribal elders exist at the Roan Antelope, Mufulira, and Broken Hill mines; their duties are to supervise the workers of their tribes and bring complaints to the notice of the compound manager. These elders are paid employees of the mines; at the Roan Antelope mine they form a council or workers' committee.¹ The legal affairs of the workers and their families are dealt with directly by the European administrative officer in his judicial capacity or by resident magistrates. In an attempt to meet the need for native assistance in dealing with the civil causes involving questions of native custom, the government has invited chiefs to send representatives to act as assessors in the courts of the District Officers. These men receive salaries: they have no judicial authority but are expected to endeavour to compose disputes.

The sale or brewing of beer in defined areas is forbidden except under licence.² Large beer halls are found in municipal and township areas, the revenue from which finances native welfare schemes: the illicit brewing and sale of beer is a frequent offence.

(f) *East Africa*

In Nyasaland the question of the urban native is not one of importance, as it largely concerns provision for the accommodation of domestic servants, clerks, and the like. The practice in the townships is not uniform. Blantyre and Limbe prohibit the residence in the townships of natives not in employment; Port Herald excludes all who are not domestic servants; Fort Johnston provides for the issue of special permits to other natives, but its town council in 1935, and that of Zomba in 1934, passed by-laws empowering them to order exclusion in the future. In Zomba a model village is in process of construction, and it was expected by the end of 1936 to accommodate all those domestic servants employed in Zomba, together with their families, who cannot go to and from their own homes to work. The village is provided with electricity, water-supply, and a sports ground.

The heterogeneous groups in the coastal districts of Kenya represent the result of that intermingling of Arabs and Africans to which is attributed the origin of the Swahili language,³ and

¹ F. Spearpoint, *op. cit.*, p. 20.

² Native Beer Ordinance 11 of 1930.

³ See Chap. III, p. 89.

which has led also to peculiar difficulties regarding land tenure.¹ The development in these areas of subordinate magistrates' courts has been described elsewhere.²

The problems of urban native administration in Kenya arise from the European character of the newer towns, rather than the size of their native population; these problems were the subject of some suggestions in the report of the Feetham Local Government Commission of 1927, a number of which were subsequently put into practice. The control of native locations and provision of housing is the responsibility of the local authority in municipalities and of the central government in townships. Of the four municipalities, Nairobi, Eldoret, Nakuru, and Mombasa, all but the last have established locations where housing is provided by the authorities. The Nairobi by-laws may be taken as typical: they provide for the establishment of a location in which only natives may reside. They are only permitted to reside elsewhere in the municipality on special permit, except in the cases of employees who are housed by their masters. In the location, plots in contiguous residential blocks are as far as possible allotted to natives with similar religious or tribal associations. Single-roomed and two-roomed quarters have been erected as part of a municipal housing scheme to provide lodgings for natives who cannot build their own dwellings. Plots may also be rented from the municipality on which natives may build their own houses in conformity with building regulations. The by-laws provide for eviction only in case of failure to pay rent, or of more than one conviction under the Liquor Licensing laws. Natives not in employment are prohibited from residence for more than thirty-six hours without a permit, a measure the enforcement of which resulted in the expulsion of more than 1,000 natives from Nairobi in 1930.³

In that year a loan of £50,000 to the Nairobi municipality for native housing was sanctioned by government. The provision made is, however, far short of the requirements; the numbers for whom accommodation is provided were given in 1931 as 6,987, while in the following year the total native population of Nairobi was estimated at 24,000, including a number of employees housed

¹ See Chap. XII, p. 850.

² See Chap. VII, p. 289.

³ *Local Government Report*, 1933, p. 22.

on their masters' premises. About 8,000 not provided for in the township have hitherto resided in the two native villages of Pangani and Pumwani; the insanitary condition of Pangani had long been a matter of adverse comment, and the government as far back as 1922 decided to close the village,¹ but the process of removing the residents has not yet been completed. Pumwani was opened in 1922, and the majority of the houses have been built by natives. It is the intention that this shall be the chief native quarter of Nairobi; both the government and the municipality have undertaken housing schemes for it. Only natives are allowed to trade in the locations and there are many native shops. In Nakuru and Eldoret the natives number only some 4,000 and 1,000 respectively, but in neither case is municipal accommodation provided for all this population. These small locations are laid out on the village plan, and at Eldoret allotments for vegetable growing are provided free of charge.²

The principal source of revenue of all these locations is the municipal beer monopoly, the income from which is paid into a special trust fund. In Nairobi, the District Commissioner is appointed to serve as a member of the municipal council, with a special view to the safeguarding of native interests, and is chairman of the Native Affairs Committee. A government officer has been seconded for service as municipal native affairs officer. Social services are provided for on a more extensive scale than in many native locations farther south. There is a recreation hall, a sports stadium, a maternity home, two dispensaries, and three clinics. A school, erected in 1935 at the expense of the Municipal Trust Fund, is maintained and staffed by government. Since there is, in Kenya, no restriction upon the employment of non-Europeans in building, there has been no complaint that municipal housing cannot be provided at a rent within the natives' means.

Mombasa stands in a different position from the three municipalities above referred to, for it has always had a large native population. The native residents now number some 24,000. There is no municipal provision for native housing. A number of 'native villages' have been laid out on private land by African

¹ *Report of the Kenya Land Commission*, Cmd. 4556, 1934, para. 589. See also J. Huxley, *Africa View*, 1932, p. 271.

² *Local Government Report*, 1933, p. 19.

and Arab landlords, and are marked by the usual features of villages of this class. In 1934 it was announced that no more such village housing schemes would be sanctioned.

In Nairobi some approach to the provision of native local government has been made by the constitution of a council of twelve influential natives who represent different tribes and creeds; it has no statutory authority, but is advisory to the municipal native affairs officer and is said to be helpful. In Kenya, where government throughout the territory is based on councils which nearly always represent more than one native unit, this is less of a departure from the established system than it would be in an indirect rule area. A tribunal, as far as possible representative, was constituted in 1932 by warrant under the Native Tribunal Ordinance of 1930: fees paid by litigants go to the Native Municipal Trust Fund, from which the members of the tribunal are paid; fines are paid to central revenue.

Tanganyika, like Kenya, has heterogeneous populations outside the urban areas. The conditions in some of the coastal districts resemble those described in the coastal areas of Kenya.¹ In the Tanga coastal district the large numbers of non-tribal natives are ruled by village headmen who are appointed and paid by the government, and act under the directions of the District Officer. The principal headmen are appointed native authorities, and are thus able to make orders and rules. The administration of justice is carried out by native subordinate courts of the same type as those in Kenya; there is no native treasury. In other parts of the territory also it has been impossible to find a suitable native authority for a mixed population, and it has been necessary to entrust these functions to a *liwali*, usually a selected headman. A typical case of this nature is that of Ujiji, near Kigoma, on Lake Tanganyika.² The large mixed populations of natives from the western part of the territory, which have settled near the sisal plantations in the east, constitute a somewhat similar problem, and also the 20,000 natives, coming largely from Northern Rhodesia and Nyasaland, who are employed on the Lupa gold-fields. In the former case the difficulty has been met, though not always with entire success,

¹ See p. 515, above.

² *Tanganyika Territory, Annual Reports of the Provincial Commissioners, 1936*, p. 64.

by making alien natives subject to the ordinary tribunals. The conditions of the Lupa gold-fields are exceptional, for most of the labourers come for very short periods, and the chief problems are those connected with the relations between them and the prospectors. Two travelling courts have been instituted to deal with minor disputes and civil cases among natives; the courts consist of the headmen of each of the five 'minor settlements' on the gold-fields; this term describes areas, other than townships, in which sanitary regulations are applied.

The largest urban native population is at Dar-es-Salaam, where it numbers about 26,000. Here an advisory board has been created which consists of six elected elders from the most important tribes. These elders, who are paid salaries, deal informally with disputes which are not important enough to go before the *liwali*, assist in tax collection, and act as a medium between the local population and the municipal secretary. It is proposed to divide the town into six areas, each with one of the elders as a headman, not less than three of whom will preside over a subordinate native court with a right of appeal to the court of the *liwali*; a district officer will then replace the municipal secretary and supervise both the headmen and the courts.

In Uganda it may be said that there is no urban housing problem; the towns are small, and as they do not form part of large segregated European areas, most natives who are employed there are able to live on their own land in the vicinity.

(g) British West Africa

The British territories of the West Coast are distinguished by the fact that an attempt has been made to develop African municipal corporations on the European model. Lagos in Nigeria, Accra, Cape Coast, and Sekondi in the Gold Coast, and Freetown in Sierra Leone, were early constituted as municipalities with partially elected councils, entitled to levy rates. In Lagos the African population is over 100,000 and the non-African about 2,000. Municipal administration began about fifty years ago with a 'Board of Health' which has developed into a town council,¹ consisting of five official members, four elected members, and four nominated members; this council is

¹ Townships Ordinance, cap. 57.

responsible for health and employs two medical officers of health as well as inspectors and social workers: it also provides maternity centres; but other services, such as education, are carried out by the technical departments under orders from government and at the cost of general revenue. The government also assists with special works, such as drainage schemes in public areas. Revenue is collected by an improvement rate and a water rate: the latter is paid to the government, which established and still maintains the water-supply. In the past a government grant of £60,000 was made to the council to cover the difference between expenditure and revenue; owing to an increase in revenue this grant has been reduced to £20,000, out of which the council may retain any unexpended balance. Town planning and slum clearance are in the hands of an official body, the Lagos Executive Development Board. There is, therefore, a considerable element of divided responsibility, and local interest in the services directly administered by government can be expressed only through the elected members of the legislative council; it may be remarked that this interest never seems to be strong except when it takes the form of opposition to taxation.

In the colony outside Lagos there has been a gradual abandonment of local government institutions, such as native town councils, in favour of the rehabilitation of customary authorities, and it has, indeed, been suggested that the degree of loyalty that is still shown to the traditional chief of Lagos, the representative of the house of Docemo, might justify his recognition as part of the administration, thus making the first step towards the development of a local administration with an inherent authority behind it.¹ It is open to doubt, however, whether the extent of the interests which have grown up in Lagos would not involve a degree of control that would inevitably deprive a native authority administration of any reality.

In the Northern and Southern provinces of Nigeria the Township Ordinance provides for the institution of second- and third-class townships, administered by an official appointed as local authority, who, in the case of a second-class township, is assisted by an advisory board. There are thirteen second-class townships and

¹ M. Perham, *op. cit.*, pp. 264 ff.

thirty-six third-class: these are usually government stations or centres of European trade with a mixed native population, which cannot suitably be placed under a local native administration. The native towns are under the jurisdiction of the native authorities. The large native city is a peculiar feature of Yoruba culture; in the Southern Provinces about five-eighths of the people live in towns. In Bantu Africa the largest native town is Serowe in Bechuanaland, with 25,000 inhabitants, while in Nigeria twelve native towns have over 34,000 inhabitants, of which nine are entirely Yoruba; Ibadan has a population recorded in 1931 as 387,133, of which only 226 were non-native. Many of these towns contain a considerable non-Yoruba element, but their long-standing association with the traditional rulers has removed some of the difficulties which a mixed population ordinarily presents.

Kano, a city of 97,000 inhabitants, presents a different problem. The township, which has grown up outside the walls of the native city, contains a considerable number of Europeans and also of non-Europeans, the majority of whom approximate more closely to European ways of life than the local natives.¹ It became clear at an early stage that the emir of Kano, though a powerful and long-established native authority, would have difficulty in dealing with the new elements which a change in economic and administrative conditions had brought to his city. At the period when indirect rule was interpreted to mean that the widest possible freedom of action should be given to native authorities, it was proposed in 1930 to solve this and similar problems by extending their jurisdiction so as to cover all persons within their local limits. The 1933 Native Authorities Ordinance rejected such a solution by which, in Sir Donald Cameron's words, 'we reach again the realm of pretence';² it retained the old provision, which placed all natives who are ordinarily subject to the jurisdiction of a native court under the native authority, but to meet the difficulties arising where non-native or 'stranger native' groups reside in native cities, such as Kano, it empowered the Governor to extend this jurisdiction to persons not ordinarily so subject. Such an extension of authority was made dependent upon the approval of the Secretary

¹ *Ibid.*, pp. 101-3.

² *Address to the Legislative Council*, Mar. 6, 1933, p. 18.

of State, and, in the Southern Provinces, to the consent of the legislative council. At the present time the township area at Kano has its own administration, under a British magistrate and government police, but an arrangement has been made by which the Sabon Gari, the part of this township inhabited mainly by stranger natives, has been given an African ward-head approved by the emir, and assisted in judicial functions by representatives of important tribal groups; appeals from his tribunal go to the alkali's court at Kano.

In 1893 the management of Freetown, in Sierra Leone, was placed in the hands of a council of fifteen members, twelve of whom were elected by the people and three appointed by the Governor. The council elected a mayor from its members. The African population thus controlled the government of the town. The municipality had to be dissolved in 1926 after a series of financial scandals; the Commission of Inquiry found that the council had no practical knowledge of what was implied by the provision of satisfactory municipal services and no standard of comparison by which to measure the success of their activities.¹ It was replaced by a town council with an official majority.

There exists in Freetown a system of tribal control of considerable interest. The Governor recognizes tribal headmen over tribal groups living in the town. Headmen are supposed to be traditional authorities, but the government may appoint a person other than the one on whose behalf representations are made by the community concerned. Until 1932 the headmen had powers to make rules regarding such subjects as indebtedness, the relief of the poor, burials, and education, subject to the approval of the Governor and the town council, but they are not now allowed to make rules, and retain only police powers: they report births, deaths, and new arrivals, and must repatriate natives who have left their chiefdom without authorization. Each native pays 6*d.* a month to his tribal headman; these sums are paid into a bank and are distributed in relief to the sick and poor of the tribe and for burials. The ordinance does not apply to the Kroo natives.

¹ *Report of the Commission of Inquiry into the Affairs of the Freetown Municipality, 1926*, p. 23.

In the Gold Coast the town councils of Accra, Cape Coast, and Sekondi were constituted in 1894.¹ They consist of five official and five unofficial members; of the latter, one is European, nominated to represent the local chamber of commerce, and the remaining four are elected. The councils may levy rates and also receive grants-in-aid from central revenues. In the past, local interest in them has not been great; in the elections of 1922, for example, only forty-six persons voted in Accra, out of an electorate of 1,117; in Cape Coast, none at all; in Sekondi, two out of 299; but if the last elections at Accra and Cape Coast, which were hotly contested, are to be taken as a criterion, the electors are no longer apathetic. The local administration of Kumasi, the administrative headquarters of Ashanti, is in the hands of a Public Health Board constituted in 1925 with resources similar to those of the town councils, and consists of five official members, two members nominated by the Kumasi council of chiefs, two by the Kumasi chamber of commerce, and an African ratepayer, nominated by government, who is not an Ashanti native.

In 1924 it was proposed in the Municipal Corporations Ordinance to give the town councils an elected majority; at the same time the head chief of every division included in a municipality was to be an extraordinary member of the council with the right to address any meeting. The burden of rates was to be redistributed as between owners and occupiers, and new sources of revenue were created. This measure met with opposition, particularly in Accra, partly through the fear of the chiefs that an elected mayor would be in a position to encroach upon their traditional authority;² in 1926 it was announced that its application would be postponed, and no further steps have been taken to put it into effect.

(h) *The Belgian Congo*

In the Belgian Congo the development of a permanent population in the industrial areas is a deliberate aim of policy. The *Forminière*,³ for example, has induced whole villages to migrate

¹ *Laws*, cap. 167.

² *Report on Objections to Municipal Corporations Ordinance*, Sessional Paper I, 1925-6.

³ *Société internationale forestière et minière du Congo*.

to the neighbourhood of their mines, where they continue to live in accordance with native tradition, selling their surplus food-stuffs to the company.¹ The *Huilever*² has followed a similar policy in order to provide a permanent supply of labour for its enterprises. The *Union Minière* of Katanga, on the other hand, when they adopted their 'stabilization' policy in 1927, had not only to look for their labouring population much farther afield, but had to establish it in an area where the soil is poor and the climate unfavourable to agriculture. Although the type of accommodation provided for their employees is that characteristic of the native village, its character, in contrast to that of the *Forminière* villages, is definitely urban. The huts are of good pattern and well built; they are laid out on carefully planned lines. Social services are provided on a generous scale; medical treatment is exceptionally well organized. A bonus is paid to every mother who is confined in a maternity ward; infants are examined weekly at welfare clinics; the proper feeding of young children is ensured through a common refectory at which they have two meals a day. Education is compulsory from five to twelve years; a medical examination of all school children is made once a month.³ A similar system is observed in the villages attached to the Kilo-Moto mines. The administration has not, however, initiated any system by which differences between natives in the mine villages can be settled by a native agency; the matter is left to the superintendents of the locations, who, as observation shows, have a very close acquaintance with their conditions.

In the larger towns a regulation, similar to that adopted in some Rhodesian town areas, limits the number of servants or employees who may reside on the premises of their employers; all others, and such labour as is required in the town or its trades, reside in a *ville indigène* or *cité noire* outside the town. These bear the appearance of being well planned and managed; plots are allotted on leasehold, on which natives erect their own huts or houses of an approved pattern. There is evidence here, as in Bloemfontein,

¹ L. Mottoule, *Déterminisme fonctionnel de l'industrie dans l'éducation de l'indigène congolais*, 1934, p. 18.

² *Cies. Réunies des Huileries du Congo Belge et Savonneries Lever Frères*.

³ See P. Charles, 'Le problème des centres extra-coutumiers' in *Record of 23rd Session of International Colonial Institute*, 1936, Annex II, pp. 33-180.

that the native under this system can evince a great pride in his house and its surroundings. In the Katanga the African and European quarters are separated by a 'neutral zone', occupied either by parks or by native hospitals, schools, and prisons;¹ elsewhere it is usual to find the location at a short distance from the town, and there is a general regulation that non-natives are not allowed in the 'native city' without permission. Trading by natives is freely allowed; there appear, indeed, to be very few non-native traders.

The Belgian administration has recognized that special provision is required for mixed groups, and persons living in circumstances in which they cannot suitably be brought within the jurisdiction of a traditional native authority. For this purpose it has instituted the system of *centres extra-coutumiers*,² and placed in this category the 'native cities' and the settlements of ex-soldiers. The local authority here is a chief with a council of five to twelve members, nominated by the *commissaire de district*; the chief is frequently an ex-employee; the members are chosen from residents in the *cercle*. The chief is responsible for the good order of his *cercle* and can detain natives who cause a breach of the peace in public places up to a maximum of twenty-four hours. The council may make rules on all matters of local interest not regulated by general legislation, and impose a penalty of seven days' imprisonment for offences against them. They may impose taxation for local purposes; as an example of the sources of revenue the Stanleyville *centre* may be quoted, where, in addition to the supplementary tax generally levied for local purposes, there are taxes on musical instruments, on plots of land allotted by the council, on shops, and on palm wine, and a hut tax is levied on unmarried women. The constitution of the *centres* provides that they may receive subsidies from the general revenue of the colony, but the policy seems to be only to give such subsidies when local resources cannot meet essential needs.³ All *centres* in a province are subject to the general supervision of a *comité protecteur*, nominated by the Governor-General, consisting of official and non-official Euro-

peans, with the *commissaire de district* as chairman, which is charged to supervise the improvement of the moral and social conditions of the inhabitants. The local *agent territorial* attends all meetings of the council of the *centre* and as representative of the government may preside and may veto its proceedings; he also advises it on lines recommended by the *comité protecteur*. It is clear that he exerts over the proceedings of the council an influence which differs little from control. The *centres* have their own tribunals, whose members are *ex officio* members of the council. Their jurisdiction is usually limited to civil cases, in which the development of a common body of law can be left to them; criminal matters are generally dealt with under statute law by a magistrate's court.¹ By the end of 1935 there were twenty-one such *centres* in existence.

(i) *The French Territories*

The problems presented by the urban native populations have arisen in some territories from the policy of segregation, and in others from the difficulty of bringing such communities under the jurisdiction of native authority of the type established under the system of indirect rule. Since the doctrine of segregation is alien to French policy, which admits no colour bar, and the traditional native authority is given no independent executive or judicial powers, difficulties of this particular type do not arise in the French territories. If the numbers in urban centres are anywhere regulated, it is mainly on sanitary or police considerations, and there is no bar on the residence of the 'advanced' native in the urban areas.

Only Senegal and the Upper Volta appear to have made legislative provision for the reservation of certain areas at urban centres for native occupation;² in the Sudan, however, it is the practice to set aside such areas, separated by an open space from the European quarter.³ At Bamako there are native quarters separated from the European town, but only a few minutes distant from it. At Pointe Noire the native quarter is laid out on a circular plan, with roads radiating from an open space in the centre and

linked by concentric avenues. Where no commune has been created, these native locations are under direct charge of the administration; chiefs are frequently appointed to act as agents, but without any independent powers.

The theory on which judicial policy is based admits that Africans living under their customary law must be regulated by that law; but the *tribunaux indigènes*¹ are so constituted that the existence of a variety of custom within their jurisdiction does not necessarily create a difficulty. While French policy recognizes the existence of a personal law regulated by custom, its objective—or at all events its tendency—is to bring all its subjects eventually under one system of law and administration based on an adaptation of European conceptions and methods; and the native who passes out of the sphere of his own law is regarded as having taken a course which assists this process. An illustration of the methods adopted to assist its development will be found in what is said elsewhere on the subject of the *immatriculation* of land,² and the special status of French ‘citizens’ as opposed to ‘subjects’.³

XXI. CONCLUSIONS

It was pointed out, at the beginning of the present chapter, that the term ‘native administration’ has a special significance, peculiar to African conditions. It will now be obvious that the terms ‘direct’ and ‘indirect rule’ must also be understood in the special sense in which they are used in Africa.⁴ It has been deemed advisable to describe at some length the different methods of native administration now in actual use, since such a statement of fact appears to be the best contribution which this Survey can make to the controversy on the respective merits of systems of direct and indirect rule. But it may also be of some value to define the issues, often obscured in debate, on which that controversy turns. Neither system owes its origin to any preconceived theory of rule. Every government in Africa has been faced by the initial difficulty of administering an extensive area with a small European staff, frequently ignorant of the local native custom and language; in every

⁴ See above, p. 413.

case it has found itself obliged, in the early days of its rule, to make use of chiefs or other native authorities, and the extent to which it has done so has depended on circumstances rather than on any difference of principle. There has succeeded everywhere a period when administrations, having passed the stage at which their chief effort has been devoted to securing the first essentials of law and order, have had to consider the type of agency best suited to assist in implementing their policy of material and social development. As has been seen,¹ there is a wide difference in the national philosophies of rule which have determined the character which such policies have taken, particularly in respect of the position assigned to the native in the political and administrative life of the country. It is in effect at this point that the difference of opinion begins which has given rise to the controversy as to the relative merits of direct and indirect methods of administration in native affairs. The advocates of the system of indirect rule have not merely attached importance to it as an agency in local self-government, of the value of which they have found evidence in particular in Nigeria and Tanganyika, but have seen in it a special virtue as indicating the correct line of approach to all questions relating to the social and political development of the native. There are, however, many who have not realized that the virtue to which they point is not that of the system of indirect rule, but of the whole political philosophy which has inspired it. The zeal with which the system has been supported in some quarters has encouraged in British colonies an attitude towards it which is not always as critical as could be desired, and also some tendency to employ it in circumstances to which it is clearly not appropriate. In the second place, it has produced from the advocates of the methods of direct rule an answer which, while in terms critical of the efficacy of the institutions utilized under a system of indirect rule, is in reality an expression of distrust in the political theory which has influenced its adoption. The attitude taken on either side has tended at times to some confusion of issues; if it has a justification, it is only to be found in one consideration. It is doubtless inconvenient that a comparison of the merits of two alternative methods used in native administration should involve, on each occasion, a debate on the

¹ See Chap. V, pp. 130 ff.

merits of the ideals of rule which influence different colonial powers; but it is nevertheless difficult to treat any one type of native administration merely as a part of the machinery of government.

If the administration of native affairs is viewed simply in that light, its problem might not unreasonably be described as the search for the most effective means of inducing native opinion to accept innovations which it does not actively demand. In the solution the emphasis may be laid on the necessity for genuine acceptance or on the importance of rapid development. The former is the end sought in the system of indirect rule, which relies on the appeal to the respect of a people for its own leaders, and its pride in institutions which it can call its own. The latter considers rather how best to make rapidly effective the decisions of superior authority, and sees its most efficient agency either in the council system, or in the training of chiefs as subordinate agents of the executive government. But such an analysis fails from its very simplicity. The efficacy of any type of native administration must be viewed not merely in relation to the part it bears in the machinery of government, but in the light of the purpose it is intended to serve in the development of the native population. It is clear, for example, that the form which native administration has taken in the Union of South Africa has been dictated by the conviction that the problem of Bantu development must be viewed primarily in relation to the position which the native must occupy in a society whose principal institutions are European in character. In this view, and it is one which will inevitably regulate South African politics for many years to come, it is not unnatural that the Union should prefer a system of direct administration in native affairs, and should rely on the council system as most suitable to provide the native areas with organs of local self-government. There is another fact which must be taken into account in considering the current policy of the Union in native affairs. There are parts of the Union, such as the Ciskei, where it would now be impossible to find native institutions possessing that traditional position, or likely to find that amount of popular support which would make them suitable agencies of local government. In some other areas, such as Natal, native authorities still retain a position of influence;

and, as has been seen, the Native Affairs Department has lately shown itself prepared to give them a larger measure of recognition, particularly in regard to the exercise of civil and criminal jurisdiction. It is not to be doubted that the type of support which it is now proposed to give to the chiefs in these areas may have its value in providing tribunals, dealing with a limited range of civil and criminal issues, whose decisions will give more satisfaction to Africans than those of the courts now available to them. But, taking the longer view, it is doubtful if a policy of utilizing traditional native authorities, in the manner in which they are utilized under systems of indirect rule, is one which could be advocated in the interests of the Union natives. It is admittedly difficult to envisage the day when the Bantu will be admitted to full rights of citizenship in the Union, but that day would certainly not be hastened by the adoption of a system which seeks to give vitality to the customary institutions of the native, as being the medium through which his development is to be achieved, and assigns to them in consequence a position of increasing importance in the state organization. Nor is the traditional authority suitable for adoption as an agency for managing the large native populations resident in the urban centres of the Union.

The sentiment which manifests itself in support of the council system in South Africa is based on the conviction that the circumstances of the Transkei, and of other territories where the play of europeanizing influences is producing very rapid changes in every aspect of life, call for the creation of new institutions which respond to new needs, rather than the preservation of authorities whose bonds with their subjects are broken. The positive advantages of the council system are its procedure, designed with a view to its functions, and its representative composition. This is held to be not only a necessary safeguard against misgovernment, but to have in African circumstances the special advantage of enabling educated natives to take part in local government. The details of the system as it now operates in the Union have already been given at some length. It is natural that attention should concentrate on the performances of the most conspicuous of its institutions, the General Council in the Transkeian Territories. The achievements of the Bunga¹ are

¹ The Councils in the Transkei and in the Ciskei are known as Bunga.

undoubted. Every one who has been present at its sessions has been impressed by the dignity of the proceedings; no one denies that genuine opinion is freely expressed. In the sphere of general politics it has now become the core of a central native council for the discussion of questions affecting the native population, while in Tanganyika, such a native council, envisaged by Sir Donald Cameron¹ as the ultimate development of indirect rule, has not yet come into existence. The extension of the council system to other parts of the Union is progressing slowly; the powers of the Native Council are at present not wide, and at all parts of the system European control is close. Nevertheless, the constitutional framework for a series of representative local governments covering all preponderantly native areas, culminating in a Native Council for the discussion of general policy, is in existence in the Union, alone of African territories.

General Smuts has written of the councils:

'They look after their own local interests, find useful expression for their political energies, and get an invaluable training in disinterested public service. A sense of pride in their institutions and their own administration is rapidly developing and, along with valuable experience in administration and public affairs, they are also acquiring a due sense of responsibility; where mistakes are made they feel satisfied that they have only themselves to blame . . . in this way they will get an outlet for their political and administrative energies and ambitions which will give them the necessary training for eventual participation in a wider sphere of public life.'²

The picture drawn by General Smuts applies in particular to the Transkeian General Council, but it does not perhaps take sufficient account of the limitations placed on its executive responsibility. As has already been remarked, the true character of the institution as an organ of local self-government will only appear when magisterial control from within gives place to supervision from without. The possibilities of internal development depend partly on the degree to which responsible magistrates regard the councils as a training ground for future native leaders, and partly on the aptness of the native members for such training. The European element in the Bunga is rightly regarded as its strength; to

¹ *Principles of Native Administration and their Application*, 1934, pp. 3, 7 ff.

² *Africa and Some World Problems*, 1930, pp. 84-5.

its initiative and guidance the constructive work achieved, and the efficiency of the public services maintained, are admittedly due. But so long as all authority remains in their hands, there must be a danger that the councils may be overtaken by the fate of all bodies so constituted; they may decline into apathy or they may, on the other hand, be driven by a sense of their own powerlessness into an unreasoning and irresponsible opposition.

In Southern Rhodesia the system of direct rule, though it rests in principle on the same basis as in South Africa, is seen in a less fully developed form. The liberal provision made for native lands is a noticeable feature of Southern Rhodesian policy; but the extent of the consideration so far given to the native's need for suitable tribunals to try civil or minor criminal issues, or for institutions which will give him some responsibility in matters of local concern, makes it difficult to say that the government has yet evolved a comprehensive scheme for the regulation of native affairs. Kenya, on the other hand, has in operation a fully developed system of native administration, based on the creation of district councils presided over by an administrative officer, with native courts whose members are nominated for the purpose. The adoption of this system is not due to a conviction, such as is entertained in the Union, that the real welfare of the Bantu lies in his rapid assimilation of the use of 'civilized' institutions; it had its origin in the fact that the experiences of the Kenya government did not give it a confidence in its traditional authorities sufficient to justify their use as judicial tribunals or agencies of local government. It is claimed for the Kenya system, that it is that best adapted to areas where Africans are continually in close contact with Europeans, and that it has an advantage, which is of much importance in those conditions, in that it provides opportunities for educated natives to take a part in local government.¹ It is possible, however, that the system is not equally well fitted to all parts of the colony, and that some adaptation of the system of indirect rule might perhaps be better suited to the tribal areas which are not in close contact with Europeans.

¹ *Report on the Financial Position and System of Taxation of Kenya*, Colonial 116, 1936, p. 109.

In the French territories the support given to a system of direct rule is deliberate. If British sentiment tends to favour the creation of institutions which furnish a training in self-government and appear to point to possible autonomy in the future, that is no essential part of the French theory of rule. The goal to which it seeks to conduct its colonies is not independence, but a progressive association with French methods of administration and with French economic and social institutions. It is natural that, in this scheme of development, the traditional institutions of the native should not appear to have that intrinsic value which the scheme of indirect rule assigns to them; they may be said to have a value only in so far as they can be utilized in order to serve the general purpose of the policy of association. From the earliest days the French have, like other colonial governments, made use of the chiefs, and up to recent years, if the traditional chief did not prove himself to possess the requisite capacity as an agent of the administration, there was little hesitation in replacing him by a nominee, not necessarily from a family possessing local authority, and sometimes even an ex-soldier or other subordinate. To-day the French recognize the value of the influence which the traditional chief or headman can bring to the service of the administration; on this point they are in full accord with those who favour the system of indirect rule, and in principle at all events persons who have no traditional claim to authority are not now appointed as chiefs in French West Africa. But chiefs continue to be only the agents of the administration, with no independent powers of their own, either judicial or executive; and France has less hesitation than Britain in removing them from office. It is, for example, noteworthy that in the Cameroons a number of lamidos who had ruled for many years have lately been removed from their posts.¹

It is claimed, not without some justice, that this system places in the hands of the administration a more efficient and better controlled agency for development than any alternative system now to be found in Africa. The chiefs are now an educated class, trained at one of the chiefs' schools where the policy for which they

¹ *Rapport annuel au Conseil de la Société des Nations sur l'administration du Cameroun pour l'année 1934*, p. 38.

are to be the agents is thoroughly explained to them.¹ If the system of *justice indigène* provides for a smaller number of tribunals than are found in British territories,² the French would claim that at all events they are not subject to the vagaries of tribal conceptions of justice. Again, the traditional authorities on whom the system of indirect rule depends are necessarily conservative; the French would contend that their system of direct administration is better fitted to make the necessary adjustment of native institutions to changing economic and social needs. In that, and in many other respects, they hold that their method is calculated to make an appeal to the *évolué* class and the educated native, for whose position the system of indirect rule, concentrating its attention mainly on tribal institutions, seems to them to show inadequate concern.

The critics of the French system address themselves in the main to two points. They are not, in the first place, prepared to accept the fundamental assumption on which the system appears to them to be based, namely, that it is to the African's own interest to pass as rapidly as possible from the use of his own institutions and his own language to a régime of French civilization and French language. They hold, again, that the operation of the system, which denies independent powers to the native authorities whom it employs, must inevitably prejudice the development of a spirit of responsibility and initiative. The first of these criticisms, however, raises more far-reaching issues than the merits of the system of direct rule as current in the French colonies. The assumption to which the critics point is an essential part of the French philosophy of rule, and the method adopted in native administration is only one of the many agencies directed to achieve the purposes which it has in view. The second point is more definitely pertinent to the present discussion. In the course of previous chapters reference has more than once been made to the opportunity which the French system affords for the abuse of authority by the chiefs and headmen.³ The report on the Cameroons for 1934 explains that the removal of the lamidos was due to their abuse of their powers, and it is not difficult to quote other evidence of the same nature. It is

¹ See Chap. XVIII, p. 1266.

² See Chap. VII, p. 291.

³ See above, pp. 585 ff.

possibly true that, as critics of the system state, if a chief brings in the requisite sum in tax revenue, builds the prescribed roads, and extends the area of cotton, coffee, or ground-nuts under cultivation in his district, his superiors are unlikely to ask in what way he has brought his powers to bear on his subjects in order to achieve these ends. But it is at the same time proper to remark, that this is not necessarily a direct consequence of the system itself; where abuse occurs, it is due to the lack of supervision by administrative officers. Abuse, as the French can with justice contend, is equally liable to occur under methods of indirect rule if supervision is inadequate. In colonies with slender financial resources and ambitious ideas of development, the use of the customary authority as government agent must equally involve the risk of the abuse of customary obligations in the interest of the achievements by which the chief knows that he will be judged. It may be that the apparent ease with which the French system of direct rule achieves its purposes makes the administration at times oblivious of the need of adequate supervision; its lack is occasionally due to shortage in the administrative staff, as in Equatorial Africa; but it must be agreed that there are other areas in which the supervision exercised is progressively reducing the opportunities for abuse.

Occasion has already been taken to remark that in the Belgian Congo there are many aspects of policy which cannot as yet be said to be fully determined; the system of native administration is, in particular, in a state of transition. The Congo government may be said to be now as fully convinced as the British that a traditional chief can render better service to the administration than one who is 'appointed'; it is not, however, as yet prepared to give the chief either the same judicial authority or the same position in local government administration as would normally be assigned to him in British territories. Like the French, the Belgians have less hesitation than the British in removing their chiefs. A striking illustration is to be found in the report to the Permanent Mandates Commission on the administration of Ruanda-Urundi for 1935, which records the dismissal of twenty-eight chiefs in Ruanda and fifty-two in Urundi.¹ Part of the reason for the unwillingness of

¹ *Rapport au Conseil de la Société des Nations au sujet du Ruanda-Urundi*, 1936, p. 73.

the Belgians to entrust their chiefs with larger executive powers is perhaps to be found in the fact that their European service of *agents*¹ is able to discharge some of the obligations which would otherwise fall on native authorities; in part also they have doubtless been affected by the fact that in the areas now under Belgian rule, with the exception of Ruanda-Urundi, they have encountered few traditional authorities who have commanded a wide measure of support among their own people.

The policy of indirect rule is now so firmly established in the British territories that areas, such for instance as the Gold Coast, which previously followed a different method in native administration, are now moving towards the adoption of institutions framed on the Nigerian model. In the form which it has now taken, the system is characteristic of the British tradition; the support given to customary institutions accords with the sentiment of a people to whose sense of trusteeship the tribal rather than the educated native makes the first appeal; all the imperial experiences of Great Britain argue in favour of a policy which affords to native peoples at once an opportunity for self-development, and the possibility of adjusting themselves, with the least possible disturbance of their own lives, to the new conditions which they now have to face. It is also important, from this point of view, that the native authority recognized is not, as in the French system, the chief in an individual capacity, but the chief and his customary council, or even, in some cases, a village or clan 'moot'.² Though, however, the principles of indirect rule are in full accord with British political sentiment, the actual development of the system has in some measure been due to fortuitous causes. The part taken by Lord Lugard in building up the system, and by Sir Donald Cameron in extending its application, has already been acknowledged.³ But it was the existence of a well-developed political organization in Buganda, and of the emirates in Northern Nigeria, constituted as Moslem principalities, which made it possible to contemplate a use of native authorities which could hardly have been envisaged if experiences had been confined to the amorphous societies of Southern Nigeria or the infirm political units of some parts of East

¹ See Chap. VI, p. 244.

³ See above, pp. 417, and 434 ff.

² See above, p. 287.

Africa. It will be realized that the most significant innovation involved by the development of indirect rule was not the grant of judicial powers to native authorities. This in effect only amounted to a systematization of the methods by which a function attached by custom to native executive authorities was exercised; the actual innovation lay in the recognition of the executive authority as a 'native administration' for the purposes of local self-government, with its own sources of revenue and a defined sphere of expenditure. The manner in which it discharges this function is the real test of the capacity of a 'native administration', and it was the success attained by some of the large organizations in this respect which encouraged the wide extension of indirect rule.

It is perhaps due to the experience gained of the working of the more important organizations that Great Britain, in pursuing its intention of developing native authorities with a wide measure of local responsibility, has given evidence of a view of African potentialities more optimistic than any held elsewhere. It recognizes, indeed, that local authorities of this type are less likely to carry out government programmes with efficiency and speed than agents selected for their qualifications and kept under close control; but it holds that this disadvantage is outweighed by the greater readiness of the governed to accept innovations which are not forced upon them. In this view it has the support of many who have made a study of African social conditions; they have been able to show in more than one case the unfortunate effects upon primitive cultures of changes forced upon them too rapidly for a satisfactory adjustment, and to point to the value of continuity with the past in social development. But it has also the support of direct experience, as for instance in the South-Eastern provinces of Nigeria, or the Northern Territories of the Gold Coast, of the value of associating traditional authorities with the introduction of changes for which it has, in other circumstances, been difficult to gain acceptance.

In spite, however, of many favourable experiences, it is clear that the scheme of indirect rule has not only its unsolved problems, but some noticeable points of weakness. It has already been pointed out that, from the administrative point of view, the traditional native authority is perhaps a less efficient agent of develop-

ment than a nominated and trained chief; it must be added that the varied responsibilities now placed on these authorities demand the exercise of close and continuous supervision by the administration. To some degree the traditional restraints against abuse of power by a chief may operate; but the system also implies the withdrawal of those summary remedies to which chiefs were liable who misused their powers or neglected their tribal obligations. However strongly government may insist that the loyalty of the people to their chiefs must be 'freely given and without external cause', the external cause is there in government support. The claims of the chiefs to tribute and service, with the irresistible force of government behind them, clearly may become oppressive, and when tribute in kind, or the crops cultivated by the subjects' labour, are convertible into cash, the chief has a strong incentive to exploit for his private ends rights which in the old economy could not be turned to any but tribal purposes. As land acquires a commercial value the authority entitled to allot it may gradually assume the position of a landlord. Again, unlike the French system, that of the British gives to the native authority an important responsibility as a judicial tribunal. It may be true generally that, as has been observed of South-Eastern Nigeria, the large number of judges and the publicity makes injustice more difficult;¹ but where there exists a native press, as in Nyasaland, the partiality of the native tribunal is a frequent subject of attack. The matter is one on which it is unsafe to generalize; it is sufficient to say here that the multiplication of native authorities, and the growing tendency to entrust to them the control of matters lying outside their traditional sphere of authority, appear to involve a need for the exercise of superintendence which is certainly not less than that required by the French system of direct rule.

There remains another question of great importance from an administrative standpoint. It may readily be admitted that the use of traditional authorities has its psychological value in facilitating the introduction of measures which might otherwise have encountered suspicion or distrust; but this need is experienced mainly at an early stage of administration. There has already arrived in some parts of Africa a stage when natives readily

¹ M. Perham, *op. cit.*, 1937, p. 244.

welcome an expansion of the health, educational, agricultural, and other social services. If in those circumstances we rely on the agency of the native administrations, we admittedly make ourselves dependent on inexperienced and inexpert bodies, whose activities, as was shown in describing the native administration in Northern Nigeria, are difficult to co-ordinate; if we make the native administrations subordinate to the central departments, we materially reduce the measure of independence which in principle they ought to enjoy. The problem thus presented is not lessened by the recognition of the fact that, if our only aim is technical progress, it can obviously be achieved most effectively by entrusting authority to centrally organized departments operating according to a comprehensive plan, as is done in French and Belgian colonies. Some of the practical aspects of this problem are now being considered by the government of Nigeria, and its decisions should prove of interest to other administrations.

The preceding observations refer to certain external aspects of the system of indirect rule; there are at the same time other difficulties which appear to be inherent in the nature of the institutions on which the system bases itself. Many observers have questioned whether the traditional native authorities, or at all events a large number of the weaker units, will not be strained beyond their powers by the tasks now laid on them. They were chosen for use as agencies of local government in order that the administration might avail itself of the influence which long-established custom had given them. But the authority which they wield, the duties they perform, the remuneration they receive, are not now those which were prescribed by custom; the greater the advance made towards the requirements of European civilization, the further do the functions of the native administrations depart from those they performed when native custom was their only law. There is, indeed, in some territories a tendency to use them as a convenient agency for carrying out functions which are not even those of local self-governing institutions, but would normally be discharged by the general administration. Everywhere the supervision exercised over them must bring home the lesson that the sanction for their authority is no longer the goodwill of their own people, but the

recognition accorded to them by the administration. There are some observers who feel that if the native authorities do not break down under the burden of the situation in which they find themselves, they can only survive at the cost of a radical alteration in their traditional character.

To feel any grave concern regarding the latter contingency would argue a failure to appreciate the real purposes of the system of indirect rule. The maintenance of native institutions is not an end in itself. They are, in any case, increasingly subject to the disintegrating influence of new economic and social forces, quite apart from any changes which action taken by the state may involve. It is even a matter of speculation whether, with the removal of the external pressures which, before the European occupation, created the need for cohesion, tribal combinations might not tend to dissolve again into their component parts, politically, as in the Gold Coast, where chiefs formerly subordinate to paramounts have been claiming independence in increasing numbers, and in a more literal sense in Central Africa, where small family groups tend to scatter and live in isolation, out of the control of any superior authority. In the long run, therefore, it may well be found that the use made of native authorities by the system of indirect rule, though it may have affected their character, will have helped to preserve their existence. If their use brings to native society the benefits which the system of indirect rule seeks to secure, the nature of the transformation to which they may be subject is of relatively minor importance. The alternative supposition, namely, that many of these authorities may break down under the burden imposed on them, is a consideration of more immediate concern. There is not at the moment sufficient material on which to judge of this possibility, for not only do many of the present authorities owe their recognition to a comparatively recent process of reorganization, but there are also many of the older native administrations which have not yet been tested in their ability to undertake social services of more than a rudimentary type. It is in the discharge of this latter function that the true test of their capacity will be found to lie. It is not unlikely that, with the growth in the demand for higher standards in the social services, the governments of some of the British territories may have to introduce some form

of direct administration in areas where the weaker native authorities have broken down.

There is a further consideration which has been much in the minds of some observers of the system. They have felt that the maintenance of indirect rule is incompatible with the growth of a large educated native population. In their view the educated African will not endure to accept orders from his inferior in civilization; he will not be content to see the government of his country in hands less qualified than his own, and he will not tolerate a judicial system that does not give the guarantees of British justice. Further, we cannot afford to neglect the material consideration that tribal institutions must necessarily afford less opportunity for the employment of educated Africans than would be found in the cadres which a direct system would maintain, and that native tribunals have no place for advocates trained in European principles of law. Just as in the West Indies a deep gulf has established itself between the educated coloured man and the labourer, so it is possible that we may see in Africa a growing breach between the educated and the tribal elements. If these apprehensions are well founded, it is clear that the growth of higher education may create an influence which will prejudice the working, and may even threaten the existence of the system of indirect rule. Here, again, we have insufficient material on which to base a forecast. At the moment, the instances where educated Africans have shown hostility are in fact most easily found in areas where indirect rule in the fully developed sense does not exist. In the Gold Coast, for example, Captain Rattray described the educated natives as feeling 'that the energy they have shown and the progress which they have made in acquiring a European education do not find a sufficient outlet in any present schemes of government based on Indirect Rule'.¹ On the other hand where, as in Uganda, Northern Nigeria, and Tanganyika, the native authorities were recognized by government while the education of Africans was still in a rudimentary stage, secondary and university education becomes available principally to the sons of men holding high positions in the native administration, and the educated class tends to become

¹ R. S. Rattray, 'Present Tendencies of African Colonial Government', *Journal of the African Society*, vol. xxxiii, no. cxxx, 1934, p. 34.

identical with the class from which native authorities are drawn. To apply another test, it does not seem that in practice there is at present any widespread reluctance on the part of those educated natives who live within the jurisdiction of native courts to resort to them: indeed, many still prefer their familiar and informal atmosphere to that of the British courts. Official opinion has always emphasized the advantages of finding a place in native administrations for representatives of the educated classes,¹ and a recent report on higher education in East Africa² suggested that in course of time it should become usual for all persons holding positions of responsibility in the East African tribes to have completed a full course at a college of university type which it is proposed to establish in Uganda. Both in the larger Yoruba states and in the small councils of the South-Eastern Provinces of Nigeria members selected for their education rather than their tribal status have been included in the councils, though they continue to form a minority. It is important, of course, to remember in this connexion that the word 'educated' covers a wide range of meanings. The members of the Nigerian Bar who now sit in the Egbe Council could not hope to find scope for their talents in a little Ibo administration. It is, indeed, likely that for many years to come the 'native administrations' will not provide an open field for the employment of educated Africans; each unit will show a strong preference for persons of its own, or from a neighbouring community.

It would be rash at this stage to attempt to pronounce a final judgement on the relative value of these different systems. In hardly any territory has the form of native authority now in existence been tested for even so long as a generation. One can do no more than speculate as to the different types of problem which they still have to face. The new relations between ruler and ruled, the efficacy of the various forms of native authority as instruments of government policy, and the reaction of this policy itself on native political institutions are among the central sociological problems which deserve to be studied in detail over as wide a field as possible.

¹ Sir D. Cameron, *op. cit.*, p. 10.

² *Report of the Commission on Higher Education in East Africa*, Colonial 142, 1937, pp. 26, 92, 110.

When analysing at an earlier stage of this chapter the form which different systems of native administration take in practice, it was thought advisable to make a separate study of the position of urban communities and of other native peoples not living under tribal conditions. The urban centres have an importance which has not always been fully appreciated by African administrations. In colonial rule the capacity of an administration to secure its purposes depends more on a general acceptance of its authority than on any sanctions it can impose; and such acceptance depends largely on the impression formed of the attitude of the ruling race by its subjects. Those impressions are not always based on the executive action of individual officers; they are influenced largely by views formed by more advanced or educated natives regarding the character of the administration, and it is largely in the towns that such experiences are formed. The influence of the urban element in the formation of public opinion will have an especial significance in French territories, where the *élite*,¹ which the government is preparing to associate with itself in the administration, will be largely urban in character. In the Belgian Congo the administration, recognizing the influence of urban centres in moulding native thought in the rural areas, aims at providing urban native communities with administrations and social organizations which will be complementary to those of the rural areas, and avoid any sharp division. The more stabilized urban communities of West Africa present, in many respects, an easier problem than the urban and industrial areas of the Rhodesias and the Union of South Africa. In the former, governments are mostly concerned with problems of control or of the development of local government; in the other cases problems are more complex and are closely related to those of labour supply.

Opposition to the growth of a native urban community is a marked feature of policy in certain African territories, particularly in the Union and Southern Rhodesia. The arguments which underlie this policy are both social and economic: it is felt that the urban native may enter into competition with the lower grades of European labour, and that his existence may create both social and political embarrassments for the white community; he breaks, in

¹ See Chap. XVIII, p. 1283.

CHAPTER X

SYSTEMS OF DIRECT TAXATION

I. INTRODUCTION

THE direct tax has an unusual importance in modern Africa. Save in certain areas under Moslem rule, a regular system of taxation was unknown before the European occupation; in many areas the tax has constituted the first step in the introduction of the native to a cash economy, and there are still parts where money is earned only to pay taxes. It has, as shown elsewhere,¹ formed at different times an important element in labour policy; the circumstances attending its collection have everywhere an important influence over the attitude of Africans towards the administration. The allocation of a share of the tax to native treasuries has its special significance in the development of the system of native administration.² The amount raised from natives by direct taxation has, again, been used by some administrations as a measure of the expenditure which should be incurred directly for their benefit.³ Though the problems incidental to the imposition of the tax among native populations will form the principal subject of this chapter, it will be convenient to preface their study by some details of the methods followed in the taxation of non-natives.

The table opposite shows the proportion represented by direct taxation in the total revenue, and the relative contribution of the different sections of the population in the territories under review for the year 1934.

II. DIRECT TAXATION OF NON-NATIVES

In the Union the collection of an income tax is governed by Act 40 of 1925 which replaces the original Act of 1917. The tax is imposed on incomes of over £400 in the case of single, and £600 in that of married, men; the maximum rate is 2s. in the £. Supertax, with a maximum of 5s. in the £, is levied on incomes over £2,500. Act 28 of 1935 introduced a rebate of 30 per cent. on the amount due both in normal and supertax. In 1933 a special tax was

Note 2. *European and Asiatic taxation*. Direct taxation of non-natives is not, in the financial statements, subdivided into Asiatic and European, but the notes indicate all cases in which Asiatics form an appreciable proportion of the non-native population.

Note 3. Source of revenue figures. Statistical information supplied by Dr. C. Leubuscher.

imposed by Act 33 on the proceeds of gold-mining;¹ this tax has not been extended to South-West Africa.

Each province levies, for the purpose of the provincial budget, an addition to the normal income tax, calculated as a proportion of that due to the Union government. In the Cape this is 15 per cent. of the normal income tax for married and $22\frac{1}{2}$ per cent. for unmarried persons, and 20 per cent. of the supertax for married and 30 per cent. for unmarried persons. In Natal it is 10 per cent. of the total assessed. In the Transvaal the rate is 15 per cent. of the total for married and $22\frac{1}{2}$ per cent. for unmarried persons; in the Orange Free State 20 per cent. for married and 30 per cent. for single persons.

A personal tax on non-natives, calculated on a different basis in each province, is also imposed by the provincial councils. In the Cape the tax is graduated, rising, in the case of married persons, from 10s. on an income of £250, with an increase of 2s. 6d. for every additional £10 to a maximum of £3; for unmarried persons the minimum taxable income is £150, the minimum tax £1, and the maximum tax £5. A 30 per cent. rebate was granted in 1935, and 50 per cent. in 1936. In Natal the general rate is £1 on incomes under £450 and £2 on higher incomes; in certain circumstances persons pay only 10s. on incomes under £250. In the Transvaal there is a flat-rate tax of £1 10s. for married persons, and for unmarried persons under 25. For unmarried persons over 25 the rate is raised to £2 5s. on incomes over £100. In the Free State the minimum is £1, with an increase of 2s. for married and 3s. for unmarried persons on each £10 above £100. In Natal and the Transvaal this tax is payable by men only. In the Free State unmarried women with incomes under £100, and married women not liable to income tax, are exempt.

The income-tax system is so designed as to relieve the poorer European of taxation; in 1935-6 there were 48,538 individual taxpayers in the Union, and of these only 468 persons paid tax on incomes less than £400; they came under assessments for periods of less than twelve months. Farmers paid income tax during 1931-2 on a taxed income of only £858,233 out of the total taxed income of £58,590,992; in 1932-3 their taxed income fell

¹ Repealed in 1936 and replaced by Act 34 of 1936. See Chap. XXII, p. 1533.

to £496,727, but rose again to £717,309 in 1933-4 and £2,256,496 in 1934-5, and in 1935-6 fell again to £1,621,487. It is stated that a large number of farmers escape the income tax;¹ this is due mainly to liberal rebates for expenditure on fences, dams, water-furrows, and other farm improvements. As regards the personal tax, it will be seen that considerable numbers of Europeans escape taxation; thus, in the Cape, married persons with less than £250 income, and unmarried persons with less than £150 income, are not taxed. There is also a liberal system of exemptions. In 1931 the exemptions in the Transvaal were 14,141,² and though the numbers were less in other provinces, it is of some interest to compare the fact that the total number of natives in the Union exempted from the native tax was in 1930 only 17,528.

Income tax is levied in the High Commission territories on the same basis as in the Union. In addition a poll tax of £2 is payable by every male over 21 who is not liable to native tax. In his report on Swaziland³ Sir A. Pim suggested a land tax at an all-round rate of 1*d.* per morgen, partly as a means of bringing the large landowning companies and non-resident owners of large estates within the field of taxation. No action has as yet been taken on this proposal.

Income tax was first introduced in Southern Rhodesia by Ordinance 20 of 1918, amended in detail in later years. It is levied on incomes of £360 for single and £800 for married men, with allowances of £75 for each child or dependant. The rate since April 1935 commences at 6*d.* in the £, rising to a maximum of 3*s.* chargeable on all incomes, company and individual, over £6,500. In 1928 an Act to tax unoccupied land was introduced, and amended in 1931.

Of the British dependencies, Northern Rhodesia introduced an income tax in 1921, Nyasaland in 1921, Nigeria in 1927, and Kenya in 1937. The minimum taxable income in Northern Rhodesia is £300 for single and £720 for married men; the rate rises from 6*d.* on the first chargeable £100 to 3*s.* on every pound in excess of £1,500, while the rate of tax on companies is 4*s.*

¹ *Report of the Native Economic Committee, 1930-2*, U.G. 22, 1932, pp. 225 ff.

² *Ibid.*, pp. 224, 225.

³ *Report of the Commission on the Financial and Economic Situation of Swaziland*, Cmd. 4114, 1932, pp. 30-1.

in the pound. In Nyasaland the minimum taxable income is as in Northern Rhodesia, but the rate rises from 3*d.* and incomes of married men are exempt up to £600. In Nigeria the minimum taxable income is £30; in the colony the tax is levied both on natives and non-natives, the number of natives liable being about half the total adult male population; the incidence (in 1931-2) was about 8*s.* 6*d.* per taxpayer;¹ in the protectorate and the Cameroons, non-natives only are liable.

Northern Rhodesia, Nyasaland, Tanganyika, Kenya, Uganda, and Sierra Leone impose a poll tax on non-natives. In Northern Rhodesia the rate is £1, payable by every non-native over 21, except married women living with their husbands. In Nyasaland the non-native poll tax, introduced in 1928, is £2 levied on males over 18. In Tanganyika a poll tax was imposed in 1932 in place of an education tax of 30*s.* which was levied from 1930. It is payable by males over 18; the rates range from £2 to a maximum of £500 on incomes over £10,000. A tax of 5 per cent. on the net annual value of houses not subject to hut tax was levied from 1923 to 1936. It has been recently stated that the territory is considering the introduction of an income tax.²

In Kenya the poll tax is additional to the income tax introduced in 1937 to replace the former graduated poll tax; the rate varies from £1 to £2 payable by males over 18. Direct taxation of non-natives has had in Kenya an interesting and significant history. When, in order to meet the financial depression of 1920-1, the Kenya government raised the native poll tax to 8 rupees, the Colonial Office stipulated that the non-native tax should be increased at the same time. Hitherto, Europeans and Asiatics had paid only a poll tax of 30*s.* a year.³ An income-tax ordinance was passed in 1920, but met with passive resistance by settlers; of the estimated yield of £328,413 for 1921 only £95,073 was collected,⁴ of which by far the greater proportion was from government servants and other employed persons.

The opposition of the settlers was sustained by a number of argu-

⁴ *Report by the Financial Commissioner (Lord Moyne) on Certain Questions in Kenya*, Cmd. 4093, 1932, p. 59.

ments; only one of them, however, had any real value—it was certainly the fact that they had themselves been hard hit by the depression. This plea served to secure the abolition of the income tax in 1922, but it did not secure any equivalent concession in the native tax. Up to 1927 the non-native community continued to pay only the poll tax of 30s.; in that year a special levy of 30s. for Europeans and 20s. for Asiatics was sanctioned to cover the cost of European and Asiatic education.

The depression of 1931 again brought into discussion the question of increasing non-native taxation. A levy on official salaries was imposed in 1932; shortly afterwards the imposition of income tax was sanctioned by the home government, but the protests of the European community again succeeded in persuading the Secretary of State to withdraw it; a number of minor financial measures was substituted, some of which were from the first unremunerative. An additional poll tax was imposed in 1932, and subsequently in 1933 a graduated non-native poll tax based on income. The rates fixed were 30s. on incomes up to £100, reaching to £500 on incomes exceeding £10,000. The increase effected by this measure was not considerable; the poll tax in 1930 had brought in £43,702; it yielded £61,866 in 1932, £64,243 in 1933, and £68,307 in 1934. The levy on official salaries was bringing in sums varying in the same years between £48,188 and £53,815. The graduated tax gave a wide scope for evasion, and left out a large proportion of taxable incomes; Sir Alan Pim, while recognizing the difficulty of making a correct assessment of farming income, strongly advocated an income tax as a substitute for the various duties imposed in 1933,¹ and an Income Tax Ordinance was brought into effect from January 1, 1937. The first £700 is taxed at 1s. in the pound, the next £500 at 1s. 6d., the next £1,500 at 2s., and higher incomes at 2s. 6d. The deductions permitted are a personal allowance of £350 for residents and £150 for non-residents. There are family allowances, also special provisions to meet the conditions of agriculture. Taxation on companies is at the same rate, with a flat rate of 2s. after the chargeable income reaches £1,200. The tax was accepted by the European members

¹ *Report on the Financial Position and System of Taxation of Kenya*, Colonial 116, 1936, pp. 233 ff.

of council,¹ but a Taxpayers' Protection League has been formed to move for the repeal of the law.

In Uganda the non-native poll tax was introduced in 1919; in its present form, imposed in 1934, it applies both to males and females, with exemption for females with taxable incomes under £150. The rates are the same as in Tanganyika.

In Sierra Leone a non-native poll tax of £2 was imposed in 1931 on all non-natives over 18 except married women living with their husbands. In 1932, 1935, and 1936 the rate was raised to £4 as an exceptional measure.

The French colonies impose an income tax, similar to that paid in France, on both natives and non-natives. It is payable only on a minimum income of 15,000 francs for single persons and 20,000 francs for married; few natives qualify for payment. A scheme is under consideration for the introduction of a graduated system for the taxation of town incomes. There is also a personal tax payable by European and native citizens, the rate of which is fixed by the local administrations. In Senegal it varies from 8 to 15 francs, the same rate being imposed on French citizens, European and native, and on other natives; in the Sudan the rate for citizens is 60 francs; in the Upper Volta 30 francs; in Guinea, the Ivory Coast, and Dahomey 100 francs; in the Niger 25, and in Mauretania 50.² In Senegal this tax becomes payable by persons of both sexes at the age of 10 years; here, the obligation to furnish four days' *prestation* labour annually,³ which extends to citizens as well as to subjects, can be commuted for cash. In French Equatorial Africa a uniform personal tax of 80 francs is imposed. In the French Cameroons the personal tax, originally fixed at 25 francs, was raised to 75 in 1927. In Togo, the basic rate was raised in 1933 from 100 to 130 francs, and an additional levy was imposed on incomes over 10,000 francs, which rises from 10 francs to a maximum of 30 francs on incomes above 100,000 francs. This tax is payable also by natives with incomes above 10,000 francs. In the three communes of Senegal, in certain areas of the Cameroons, and also in Guinea, a house tax is imposed on Europeans

¹ Cf. Chap. VI, p. 169.

² A. Girault, *Principes de colonisation et de législation coloniale*, vol. ii, 1929, pp. 764-8.

³ See Chap. XI, pp. 624-6.

and natives, the rates varying between 5 and 6 per cent. of the rent. Land taxes are imposed in urban areas in Senegal, the Sudan, the Upper Volta and Dahomey, and in Equatorial Africa. These are payable by all owners of landed property on individual tenure, whether native or European. In Senegal the rate is 6 per cent. of the rental value of house property, 1-4 per cent. on the saleable value of undeveloped land; in Dahomey 3-5 per cent. on the rental value of house property, and 0.25-0.5 per cent. on the saleable value of undeveloped land.¹

The Belgian Congo introduced an income tax in 1920.² The rate is graduated from 1 per cent. to 10 per cent. of taxable income; the taxable minimum is 9,000 francs for Europeans, with an allowance of 1,500 francs for each dependant, and 3,000 francs for coloured persons, with an allowance of 500 francs for each member of a monogamous family.

It will be seen that, in certain British territories, a preference still exists for imposing a personal tax instead of the tax on income which is normal in European countries. The former has some advantage in the comparative ease with which it can be applied, particularly to Asiatics and other traders, or to Europeans of the class who keep no regular accounts. But it presents difficulties in graduation; in most cases it moves upward by arbitrary stages; and, as will have been seen, it is in some areas subject to a maximum which relieves high incomes of taxation. There is the further objection, that under a system of personal tax the commercial or industrial company practically escapes taxation. In the controversy which took place regarding the introduction of income tax in Kenya, it was urged by Europeans not only that the tax involved difficulties of assessment, particularly in the case of income derived from agriculture, but that the European community made its full contribution to the revenue of the colony through indirect taxation. There is admittedly some substance in the former argument; as regards the latter, however, it must be remembered that the customs tariff of Kenya has been designed mainly to assist producers by protective duties on the importation

¹ A. Girault, *op. cit.*, pp. 764 ff.; *Annuaire de documentation coloniale comparée*, vol. ii, 1929, pp. 233-4.

² *Codes et lois du Congo belge*, 1934, pp. 1346 ff.

of competing products and by the free import of articles necessary to their industries. In truth, neither argument is convincing, and there appears no good reason why the non-native section of the population should not everywhere make its contribution to the general revenue in the form of income tax.

III. SYSTEMS OF NATIVE TAXATION

(a) *Union of South Africa*

In the chapter dealing with labour problems reference is made to the part which the imposition of the native tax at one time bore in the labour policy of South Africa. As there shown, the tax no longer has the same significance as an incentive to wage-earning;¹ it has become a normal factor in the general native economy; but some aspects of the system have an important bearing on native policy. Up to 1925 taxation varied with each province, ranging from 12s. in the Cape to £2 in the Transvaal. With the exception of taxes from the Transkei and certain similar areas, the whole of the tax was paid into the general revenues, and there was no special allocation for native purposes. The power of imposing direct taxation was withdrawn from the provincial councils, and a unified method of taxation was introduced by the Natives Taxation and Development Act 41 of 1925. The aim of this measure was to fix the rate at a level that would provide revenues commensurate with those previously derived from native taxation, and at the same time to supply funds for the extension of native education. It was based on the principle that services for the benefit of natives must be met from native taxation; the merits of this principle will be discussed in the chapter dealing with education.² As a result, a poll tax of £1 on every male over 18 was imposed; four-fifths of this was to be paid into general revenues and the remaining one-fifth to be devoted to native education and welfare. As from April 1, 1935, this proportion was increased to two-fifths.

In addition a local tax was imposed on natives living in rural locations or reserves, except those who hold land on quit-rent tenure; this was fixed at 10s. for every hut, with a maximum of £2

¹ See Chap. XI, p. 639.

² See Chap. XVIII, pp. 1213-17.

for any individual. These revenues are paid into a Native Development Account, in which the revenues from general and local taxes are kept separate. The 'A' account, or general fund, is devoted chiefly to native education, but a portion has been expended on agricultural development, more particularly in making provision for agricultural instruction at the Fort Cox School, and on the employment of native demonstrators. The 'local' fund is expended in the areas in which it is collected, through the medium of local native councils or location boards where these exist; one of the principal objects of expenditure from this fund has been the dipping of stock.¹ The total revenue of the general fund from its inception to 1936 was £6,219,414, of which £5,687,004 was expended in grants to the provinces for native education, and £146,879 on agricultural education.² Up to the end of March 1935 a total of £1,553,890 had been paid out from the 'local' fund to native councils and location boards; expenditure from this fund on dipping-tanks totalled £455,873, and on location fencing £8,981: no grants are, however, made for the Transkeian Territories, as, under special provision of the Act of 1925,³ collections of local tax and quit-rent accrue to the Central Council; the objects on which the Council expends its funds are explained in the chapter dealing with Native Administration.⁴

Though the regulations provide that chiefs shall assist in the administration of the tax, the collection is in practice made directly by administrative officers. Native Commissioners,⁵ or magistrates, where no Native Commissioner is stationed, are charged with the duty of maintaining a register of taxpayers. Liability for tax commences at the age of 18, when a native is obliged to register in the district of domicile. He may, however, pay wherever he is, and a high proportion of the payments is made by wage-earners away from home, the native remaining on the register of the district so long as the family continues to live there. A duplicate of the tax receipt is forwarded to the district of domicile by the office which receives the tax, a procedure which frequently leads to confusion and double registration, especially as in some areas, e.g. Natal,

⁵ Government Notice 2250 of 1928.

the native's clan name is registered as a surname, while in others, as in the Transkei, only his family name is shown. The taxpayer is expected to make payment at the office of the receiver; in extensive districts, however, especially in the Transvaal, tours are usually organized. The tax is due on January 1 in each year;¹ but later dates have been fixed in certain districts,² in order to take account of harvesting operations; in some areas action is not taken against defaulters till July 1, and till September 1 in others.

The great majority of natives pay their taxes before the final date; as regards the remainder, collection is attended with the difficulty which must always be faced in realizing a personal tax from a population characterized by a considerable degree of movement; it is this difficulty which must be held accountable for the fact that recovery is enforced so largely by criminal processes. Tax receipts, or certificates of exemption and extension, must be produced on demand to a receiver of tax, or his agent, to a European member of police, and to a recognized chief or headman; failing compliance, a native may be arrested without warrant, subject to the observance of the general instruction that this power must not be exercised when a reasonable explanation is offered. In reserves and tribal areas it is customary for a messenger to collect the tax from defaulters, who pay an additional fee of 2s. 6d., or, failing payment, to attach the defaulter's cattle. Elsewhere, the convicted tax-defaulter is usually made to pay a fine in addition to the tax; if he cannot meet the obligation, he is imprisoned, the maximum period being three months; unemployed natives who have not been exempted are invariably imprisoned. Punishment does not cancel the liability for the tax.

In view of the wages paid to natives in the mines, and in some of the secondary industries, there must be large numbers on whom the incidence of the tax is not heavy; it bears more hardly on those who are employed as labour-tenants on farms or who live in the less developed reserves. The incidence of the tax, however, is less important than certain aspects of its assessment and collection. It is an inherent feature of a flat-rate tax of this nature that it permits of no graduation between individuals, and the Union does

¹ Act 41 of 1925, sect. iii.

² Government Notice 1712 of 1931.

not attempt, as do a number of territories, to mitigate this fact by differentiating between the richer and poorer areas. Unlike an income tax, again, there is no automatic relief for the individual who by reason of physical or other incapacity can earn no income; exemption may be granted on the grounds of age, chronic disease, or other causes of incapacity; some considerable measure of relief was effected by Act 49 of 1935 which exempted all natives over 65, but in other respects the grant of exemption depends on the discretion of the magistrate. The Native Economic Commission of 1930-2 showed that, in 1930, 17,528 natives were exempted from the tax, of whom 9,931 were exempted on grounds of indigency; the relative figures of Europeans exempted on various grounds from the personal tax¹ would seem to show that there is some lack of liberality in applying the rule to natives. Part of the difficulty thus arising is no doubt met by the strength of the Bantu family custom, which accepts collective responsibility for the tax on individual members; but that custom must be of declining force in the conditions of industrial and urban life.

Even more noticeable, however, is the use to which the tax receipt is put for what may be described as police purposes. It is a provision peculiar to the Union that, in areas proclaimed for the purpose, failure to produce the tax receipt is in itself an offence for which natives may be arrested without warrant. This provision is freely used, particularly in the Transvaal; the police not only stop and question individuals, but raid houses for persons who do not possess their tax receipts. The power seems also to be used for purposes which have little reference to the payment of tax. At the 1936 meeting of the Transkeian Territories General Council a magistrate referred to two such cases; in one a meeting of an African nationalist movement was broken up and forty-nine persons arrested for failing to produce tax-receipts; in the other a chief complained of the unauthorized settlement of strangers on his land, and 149 were arrested under the Taxation Act. The system no doubt has a convenience for certain administrative purposes; but the results could be attained in a more normal manner by a specific provision in the criminal law, which would avoid the prejudice against the administration which must be created by the

¹ See above, p. 549.

use of fiscal provisions for police purposes. The result of the rigidity with which the tax is collected and of the use of the receipt for police purposes is seen in the number of convictions under the Native Taxation Act; they numbered no less than 68,915 in 1935. The manner in which the tax is administered, rather than the tax itself, makes an unusual and perhaps unnecessary addition to the amount of 'statutory offences' committed by natives.

(b) *South-West Africa*

In South-West Africa no general flat-rate tax has yet been imposed, and the basis of native taxation is the imposition of grazing fees, which are charged at different rates on Crown land and in reserves. A dog tax is levied on natives and Europeans alike. The revenues received from natives in reserves are credited to the reserve funds. The South-West Africa Commission of 1936 reported that the Herero had expressed a preference for a uniform poll tax in place of the grazing fees; the Commission, however, were opposed to this, their ground presumably being that the grazing fee allowed of a more effective discrimination between rich and poor. It is noticeable that the Commission also stated that 'the Legislative Assembly has been disinclined to be liberal with appropriations for services peculiarly in the interests of the natives', on the ground that 'it would be inequitable further to tax the European for services conceived entirely in the interests of the natives, who hardly contribute to the revenue at all'.¹ They recommended an increase in native taxation; they did not, however, commit themselves as to the form which this should take.

(c) *Basutoland*

Each of the three High Commission Territories has its own system of native taxation. The declaration of British rule over Basutoland in 1869 was followed in 1870 by the imposition of a hut tax of 10s., payable in cash, grain, or stock. An increase to £1 imposed by the Cape government in 1880 was one of the causes leading to the Gun War of that year, and the old rate was restored on the assumption of direct control by Great Britain in 1884. In

¹ *Report of the South-West Africa Commission*, U.G. 26, 1936, para. 384.

1898 the rate was again raised to £1, in order to enable the territory to dispense with the annual contribution of £20,000 from the Cape government, which had been agreed upon as part of the settlement of 1883. The raising of the tax to £1 in 1898 was with the general consent of the Basutos, as they were very anxious to be independent of the Cape. In 1911 a poll tax was substituted for the hut tax, thus for the first time extending taxation to unmarried men. The principle of the hut tax was retained by the imposition of an additional £1 for every plural wife, but the maximum was fixed at £3. The basic tax was increased by 5s. in 1920, and an additional levy of 3s. for educational purposes was imposed in 1926, making the minimum tax £1 8s. The age at which tax becomes payable is 21, except in the case of contract or voluntary labourers proceeding to work in the mines, who are liable to pay at the age of 18.

The chiefs are, in principle, responsible for collecting tax, and up to 1899 they appear to have carried out this responsibility without assistance from the British officers. With the increase in the tax difficulties arose, and the administration assumed a direct share in collections; the function of the chiefs is now limited to rendering such assistance as is required by the administration. Tax registers were introduced in 1911-12, but inefficiently kept, and receipts were rarely issued. In 1928 collectors were appointed; they make intensive collections, with the assistance of the police, during the second half of each year. Of the total collected, 5 per cent. is returned to the chiefs and their messengers: the collectors receive a share of this, but it has been asserted that the actual work continues to be done by village headmen. The paid collectors are responsible for the maintenance of the registers, which are not checked by any superior authority; that the receipts never approach the amount which is indicated as due by the registers is accounted for, in part at least, by failure to remove the names of dead persons. Sir Alan Pim¹ considered that if there is to be any attempt to arrive at a system of real indirect rule, a return to the system of collection through chiefs, under strict supervision, is desirable as a first step towards a native treasury; he has recom-

¹ *Report on the Financial and Economic Position of Basutoland*, Cmd. 4907, 1935, pp. 57-8.

mended a periodical check of the registers by assistant commissioners—a practice which, in his view, has the further advantage of bringing the European official into closer touch with native life.

(d) *Bechuanaland Protectorate*

In Bechuanaland the poll tax was fixed at 10s. in 1899 and raised to £1 in 1909. In 1919 a levy of 3s. on every hut was imposed in order to constitute a native fund, and the contribution for this purpose was raised to 5s. in 1930. In 1932 this levy was amalgamated with the general tax, which thus became 25s. for each adult male, with an additional 25s. for each wife in excess of one, up to a maximum of £3 15s. In 1933 the rate was reduced to 15s. with 15s. for each plural wife and a maximum of £2 5s., the payment of 5s. per tax to the native fund being maintained. The tax becomes due at the age of 18. It may be paid in cash or in kind; contributions of grain are used directly by the administration, while cattle and other goods are sold to traders. In Ngami-land in 1933, 75 per cent. of the collections were made in kind.

The chiefs have a more definite position in the collection of the tax than in Basutoland. They stipulated from the first that the collection of the tax should be left in their hands,¹ and they attach equal importance to this position to-day. Their execution of this duty, however, has been open to criticism. Collectors appointed by them maintain the registers and organize the collection through subordinate chiefs and headmen; the chiefs receive a commission of 10 per cent. on collections made before the end of October, and 5 per cent. on those made after that date. In each year since 1933-4 it has been found necessary to double the rate of commission. Magistrates keep a copy of the registers, scrutinize the collections, and provide police to deal with defaulters, but do not check the lists, which are clearly defective. A special check made in the Bamangwato Reserve resulted in the striking off of some thousands of names. In the Batawana and Bakwena Reserves the magistrates in 1928 assumed responsibility for the collections, in the former case on the discovery of embezzlements by the head collector, in the latter on the deposition of the chief for inefficiency; in the Batawana Reserve further embezzlements in 1931 led to the

¹ See Chap. IX, p. 407.

appointment of the European police as head collectors. The chiefs, however, continue to receive their commission and to be responsible for the registers. Sir Alan Pim recommended the restoration of responsibility to the chiefs under stricter supervision, on the ground that the exercise of financial powers is an essential function of a modern native authority, and that it would be difficult to make effective a system of collection to which the chiefs were opposed.

It is clear, however, that the present system of assessment and collection by chiefs, though it may help to maintain their traditional authority and may perhaps be more acceptable to many members of the tribes, is in other ways far from effective. It may be assumed that with the introduction of the more systematized form of native administration, to which reference has been made,¹ the tax system will also be regularized. It is of even more importance to note that in the special conditions of Bechuanaland the incidence of the tax is at times severely felt. It was calculated that as the result of the economic depression there would be 10,000 taxpayers in default in 1933; and though the rate of the tax was, as already explained, reduced in that year, it is necessary to recognize the special need for elasticity in collection of the tax in Bechuanaland.

(e) Swaziland

In Swaziland the rate of taxation is higher than that of the other High Commission territories or the Union. It is 35s. for every adult male, single or with one wife. A man with more than one wife pays 30s., with 30s. for each additional wife up to a maximum of £4 10s. This includes a levy of 2s. per head for the Swazi National Fund.² There is also a dog tax of 5s. per dog. Here the great difficulty in collection is the prolonged absence in employment outside the territory of a large proportion of registered taxpayers. Collection is made by the administrative officials at camps to which the natives are summoned. Native chiefs and headmen are responsible for bringing in defaulters.

The problem of the collection of tax from absentees constantly presents itself in all these territories, dependent as they are economically on the export of labour to the Union. The Bechuanaland

¹ See Chap. IX, p. 409.

² For the Swazi National Fund, see Chap. IX, p. 402.

chiefs and their collectors formerly spent a considerable time in Johannesburg for this purpose. In 1932 the Basutoland government opened a tax office in Johannesburg, and in 1933 its scope was extended to include Bechuanaland and Swaziland; it appears to have justified its existence as a revenue-collecting agency.¹ Recruiting organizations which engage labourers for the mines pay on their account one year's tax which is subsequently deducted from their wages, but in the case of labour outside the Rand which is not obtained through an agency, no provision exists for the collection of tax in the Union.

(f) *Southern Rhodesia*

In Southern Rhodesia there is a poll tax of £1 for every adult male with an additional 10s. for each wife in excess of one.² Exemptions are granted by the District Commissioner to persons prevented from working by 'age, chronic disease, or other sufficient cause'. There is a tax of 5s. on dogs, of general application, which brings in more revenue from the native than the European population. The law provides that, as an alternative to fine or imprisonment, a tax defaulter may enter an approved contract of service, and have the amount of the tax deducted from his wages; it is estimated that it requires at least two months' work to earn the necessary tax. This provision does not seem to be applied in practice, and up till 1934 the normal course was to send defaulters to prison; in that year convictions for non-payment of tax numbered 8,595. In 1935 the government instituted detention camps in the reserves in order to segregate natives convicted of minor and statutory offences from habitual criminals. Tax defaulters sentenced to a period at these camps are usually set to work on roads in native reserves, the amount of the tax being debited to the reserve fund. The extent of the annual arrears, which were £58,830 in 1933-4 and £58,612 in 1934-5, and which involve annually a considerable write-off, seem to indicate the need for a re-examination of the present system, both in regard to the territorial graduation of the tax and the method of collection.

(g) Northern Rhodesia

In the British East African Territories the characteristic form of taxation is a poll tax or hut and poll tax, which is graduated in the sense that the rate is varied from district to district. In Northern Rhodesia a poll tax is levied on every male over 18. Up to 1911 different systems were in force in north-western and north-eastern Rhodesia, the former having a poll tax of 10s., with an additional 10s. on plural wives, the latter a hut tax of 3s. After 1914 the poll-tax system was extended throughout the country and the rate in the north-eastern districts was gradually increased. In 1929 the plural wives tax was abolished, but the rate was increased by 2s. 6d. in all cases, giving a rate of 12s. 6d. in the north-western districts other than Balovale, where it was 7s. 6d., and 10s. in the north-eastern districts. Taking the proportion of recoveries as a criterion of the incidence of the tax, it may be noted that in 1929 the average collection was 60 per cent. of the total demand in the native areas, while in the settled districts it was over 80 per cent., and in one district 95 per cent. With the economic depression, however, this percentage fell sharply. In 1932 only 47 per cent. of the persons liable paid. In 1933 the percentage from three Barotse districts was only 8.9 in Mankoya, 17.5 in Senanga, and 15 per cent. in Lealui; these percentages, however, improved slightly in 1934. The total arrears outstanding were £146,132 in 1933, of which £56,017 were due from Barotseland, and £189,089 in 1934.

Largely as the result of the difficulty experienced in recovery of the tax in the depression period, a revision of the system was undertaken towards the end of 1934, the rate being reduced in most districts, but it remained at 12s. 6d. in the northern urban and native areas on the railway line, and was increased to 15s. at the three larger coppermines. Since it was regarded as inequitable that natives working in identical conditions should be taxed at different rates according to their place of origin, those who had already paid tax at a lower rate were required to pay the difference if resident for more than one month in an area assessed at a higher rate. The principle may have been equitable, but the decision had the effect of doubling the original tax for persons normally resident

in an area at a low rate of assessment; and the circumstances in which it was announced to workers in the mines was undoubtedly one of the principal causes of the rioting which broke out in the copperbelt in 1935. The incident seems to illustrate the difficulty of devising a system of taxation appropriate to the circumstances of populations dependent upon migratory labour. The rate of 12s. 6d. was estimated in 1935 to represent as much as three months' effort, many natives spending a considerable time in travelling from outlying districts to places of work, and it must be remembered that it is still a common practice for a man to earn one or more relatives' taxes as well as his own. From 1935, therefore, the rate of tax was reduced to 7s. 6d. for all districts away from the line except Fort Jameson, and for that district also in 1937. In the three central districts (Livingstone, Broken Hill, and Ndola) it remained at 12s. 6d., but in the other districts of the railway belt it was fixed at 10s., except at the mines, where it was 15s. It has been pointed out that the increased rate in the mining areas might well be offset by the reduction in the amount that had to be earned on account of relatives living at home.¹

The annual report for 1936 considers the percentage of current taxes paid in many districts encouraging, being from 84 to 87 per cent. in various districts, though in one (Balovale), only 3 per cent., partly owing to political disturbances. Some further experience of the working of the tax in normal conditions would seem to be required before it is possible to decide on its real incidence. There are few opportunities of earning money in Northern Rhodesia, save in the coppermines, and some 40 per cent. of the taxable population leaves the country in search of employment. In certain parts of the territory the exodus of males is a conspicuous and recurring feature. In spite, therefore, of the fact that the tax is lower than in Southern Rhodesia, it would seem to have a more marked effect on native life, and it was recommended in 1938 by Sir Alan Pim, who considers that rates are still too high in outlying districts, that, failing the introduction of an alternative system, a reduction in receipts will have to be accepted. The system which he recommends is a general minimum tax plus a

¹ *Report on the Disturbances in the Copperbelt, Northern Rhodesia*, Cmd. 5009, 1935, pp. 5, 7.

percentage of wages above a fixed rate.¹ The government has declared its intention of considering the introduction of a more equitable system.

The law provides that the tax may be paid in kind, but not in labour. The punishment for default is, since 1934, one month's imprisonment, or, in the case of persistent offenders, six weeks; the District Officer may grant exemptions to natives unable to pay for economic reasons; since 1935 provision has been made through a Native Tax Relief Grant for programmes of public works in which natives who cannot raise the necessary cash by other means are allowed to earn the amount of the tax. In 1935 the value of relief work done was £18,328, and in 1936 £12,744; the estimated expenditure under this head was £10,000 in 1936 and £7,000 in 1937. In its first year it was said to have resulted in the collection of considerable arrears in cash, the natives preferring payment to work; in 1936, however, it was reported from Barotseland that there was a tendency for taxpayers to fall into default deliberately, so as to defray their obligations by the easy course of tax-relief labour. The number of defaulters committed to prison was 1,951 in 1936 against 6,080 in 1934, and in that year a circular was issued which greatly tightened the procedure in tax-default cases. Nevertheless the prevention of deliberate default has become increasingly difficult.²

Under the rule of the British South Africa Company the assistance of chiefs and headmen was enlisted in collecting tax and arresting defaulters; at a later date collections were made by clerks or messengers in the direct service of the government, and it is noteworthy that the same complaints of arbitrary action that have been used elsewhere as an argument against the employment of native authorities for this purpose have been brought against the native officials. Since it is clearly impracticable for the actual work of collection to be done by European personnel, it would seem to follow that the essential factor in the prevention of abuse is the degree of supervision exercised rather than the status of the native agent employed.

¹ *Report on the Financial and Economic Position of Northern Rhodesia*, Colonial 145, 1938, pp. 127-8.

² *Ibid.*, pp. 123-4.

(h) Nyasaland

In Nyasaland the hut and poll tax¹ is relatively low, being at a flat rate of 6s. imposed upon males over 16; unmarried men are covered by the poll, married men by the hut tax. A hut tax is payable on account of any wife in excess of one, whether or not she occupies a separate hut: it is also payable by any adult unmarried woman who owns a hut. For taxes not paid before September 30, the rate is raised to 9s. Payment may, by special authorization of the Governor, be made in instalments or in kind. The Emigrant Labour Committee² drew attention to the difficulties which arise from accepting payment in kind if there is no organization for the disposal of the produce accepted. The penalty for default is imprisonment up to six months, and the forfeiture of the hut. Exemptions are given to widows and persons prevented from raising the tax by age, disease, or infirmity. Nyasaland makes the same provision as Southern Rhodesia for the payment of tax by deduction from wages earned under an approved contract. In practice available employment, for example on road work with the Public Works Department, is indicated to defaulters, and judgement is 'suspended' and cancelled if the tax is paid. Statistics are not published which would show the number of criminal cases in the territory as a whole. A tax-relief grant similar to that described in Northern Rhodesia was made in 1935; but only £3,601 was spent out of an estimate of £6,377. Only persistent defaulters are imprisoned.

The tax here is considered to be equivalent to about one month's wage, but the burden is relatively heavy in the undeveloped Northern Province, owing to the absence of local employment, and this was regarded by the Emigrant Labour Committee of 1935³ as one of the principal causes of the exodus of young men from the territory.⁴ The Committee noted that it has become a point of honour with the wives of absent husbands to pay the tax due on their behalf rather than admit that the husband has ceased to send any money home, and they are driven in some cases to

¹ *Laws*, cap. 52.

² *Report of the Committee appointed to enquire into Emigrant Labour*, 1935, p. 20.

³ *Ibid.*, pp. 17 ff.

⁴ For this exodus see Chap. XI, pp. 701-2 and 707.

illicit brewing and prostitution.¹ It recommended the abolition of the hut tax and the substitution of a graduated poll tax based on the relative opportunities of earning money in different districts: the graduation was to include the imposition of higher rates on Nyasaland natives employed in other territories, the rates suggested being 15s. in Southern Rhodesia and £1 in South Africa.² A further inquiry in 1937³ repeated the proposal for a graduated poll tax, the basic rate to be 8s. It also recommended that the native authorities be allowed to levy additional local rates in the more prosperous districts, and that the Governor be given power to reduce the basic rate to any level in the poorer districts. Ordinance 26 of 1936 provides for the exemption from local taxation of Nyasaland natives who have paid tax elsewhere, subject to reciprocity on the part of the territories concerned.

It appears to have been hoped that with the introduction of the system of indirect rule the native authorities would take an active part in the collection of tax. The powers given to the native courts, on their institution in 1933-4, included competence to decide cases under the Native Hut and Poll Tax Ordinance; but these were abrogated in 1935, as it was considered inequitable to convey any impression that the native authorities were government servants and were responsible for the actual collection of the tax. It is impressed upon these authorities, however, that it is in their own interest to supply information regarding defaulters, and to ensure that their people discharge their tax liability. Native treasuries do not receive a proportion of the tax for general purposes; the 6d. rebate given on each tax is earmarked for the payment of salaries to native authorities.

(i) *Tanganyika*

In Tanganyika the German administration introduced a hut and poll tax in 1897, the first payments for which were made in kind; when the circulation of money became general, the rate was fixed at 1 rupee, and raised in 1905 to 3 rupees. In 1912 the tax was converted into a poll tax of the same rate; this tax was continued by the mandatory government until 1922, when hut and

¹ *Report*, op. cit., 1935, pp. 33-4.

² *Ibid.*, p. 48.

³ E. Smith, *Report on the Direct Taxation of Natives*, 1937, pp. 10, 28.

poll tax was imposed; the poll tax was payable by men over 16 who were not liable for hut tax.

A new system was introduced in 1935.¹ A community tax, assessed on the group as a whole, is imposed on two tribes, the Masai and Barabaig cattle nomads, among whom the patriarchal family head had been held responsible in practice for procuring the sum due from the taxpayers of his family. Where this is not levied a house tax is imposed. The definition of 'house' under the ordinance represents an important innovation. It may include any number of huts grouped together in such a way as to constitute the dwelling of one family. The house tax thus ceases to discourage the building of separate huts where a family cannot live in one hut without unhealthy overcrowding.² Where a man has more than one dwelling, as is the case where a man has two wives in two different villages, he must pay house tax in respect of each dwelling. In such a case no 'plural wife' tax is levied. If, on the other hand, a man has more than one wife living in one dwelling, every wife after the first is taxed at a rate which is in most parts of the country half the house-tax rate, but in a few districts for special reasons is equal to the house tax. Provision is made for the exemption by government order of any person, class, or tribal or territorial unit. Students, for instance, are so exempt.³ Individuals may be granted permanent or temporary exemption by administrative officers on grounds of age and infirmity. The ordinance provides for the discharge of the tax obligation by labour on public works, but this provision applies only to males under 45 years of age. The penalty for refusal to accept such labour is three months' imprisonment. The rate of tax varies from district to district, and with a view to avoiding injustice may be varied for different classes of natives in one district. Thus at Arusha alien natives are taxed differently from Arusha natives, and in the Lake Province migratory Congo natives benefit from a considerable reduction. The rate is fixed annually. In 1937 rates in rural areas varied from 4s. to 15s.,⁴ and in townships from 7s. to 20s.⁵ This is estimated as equal to one month's wages.

¹ Native Tax Ordinance 20 of 1934.

³ Government Notice 174 of 1935.

⁵ Government Notice 185 of 1936.

² See Chap. XVII.

⁴ Government Notice 169 of 1936.

The system of indirect rule is here held to imply the responsibility of the native authorities for the collection of the revenues both of the native treasuries and of the central government; the native treasuries are financed by a rebate, the amount of which varies in different cases; the total paid to native administrations is between 20 and 25 per cent. of the revenue from native taxation.¹ The native authorities are subject, however, to strict supervision; remittances must be made at least fortnightly and tax books taken to the district offices for checking at the end of every month. In areas not falling within the jurisdiction of any native authority, the tax is collected by headmen and paid collectors. The assessment and compilation of the registers is the duty of District Officers. The practice has been to rely on lists of names furnished by native authorities, but house-to-house assessments are sometimes made. The estimated total number of taxpayers is 1,539,000 and the maximum collection appears to have been made in 1929-30, when 1,527,000 taxes were paid, including some 25,000 arrear payments. The collections reacted sharply to the depression period; in 1930-1 the figure was 1,433,000; in 1931-2 it fell to 1,132,000 and in 1932-3 rose again to 1,184,000. The extent of intervention by District Officers in the process of tax collection varies with the circumstances of the district; there is always a certain measure of action on their part; in the depression period it largely increased in some districts, a fact which cannot have failed to prejudice the relations which should exist between the District Officer and the people.

There has been an interesting development in the effort to facilitate the payment of the tax by instalments. In some areas cards are issued to which stamps may be affixed, a completed card being exchanged for a tax receipt. This has been found satisfactory in the case of natives working for regular wages; but the opinion has been expressed that in the purely native districts it will tend to reduce collection through the difficulty of insisting on full payment if once a partial payment has been accepted. In Bukoba in 1936 rules were issued permitting the payment of tax in two instalments only.

In many respects Tanganyika is distinguished by efforts made to adjust the burden of the direct tax; but it has not been able to

¹ See Chap. IX, pp. 439-40.

remove some of the difficulties which are inherent in the nature of the tax itself. The house tax appears to correspond roughly with differences in wealth; but the plural wives tax is not only exceedingly unpopular: in some cases it results in taxing what are liabilities rather than assets. There appears to be no recognized system of granting exceptions in periods of climatic or other vicissitudes. An interesting proposal has been made for the imposition, in areas proclaimed for the purpose, of a graduated personal tax on taxable wealth;¹ this is to be assessed on the profits of any trade or employment and the value of livestock, the amount represented by obligations to dependants under tribal custom, as estimated by the native authority, being deducted. This tax has not yet been levied; doubts have been expressed as to the desirability of leaving the assessment to the native authorities, and the method of calculation to be adopted has not yet been worked out in detail.

(j) *Kenya*

In Kenya the Hut Tax Regulations of 1901 imposed a tax of 2 rupees, raised in 1902 to 3 rupees, and the Hut Tax Ordinance of 1903 allowed variations of the amount of tax with a maximum of 3 rupees; it was described as payable in cash, kind, or labour. The Commissioner was empowered to direct that, where two or more adults lived in one hut, each additional adult should pay an amount equivalent to the hut tax, and this was done in the Coast Province in 1905 and in the Kikuyu area in 1908. The combined hut and poll tax was applied throughout the territory by Ordinance 2 of 1910, which imposed a tax of 3 rupees on every hut, payable by the owner, and a poll tax of 3 rupees on every male over 16 not liable for hut tax; the aim of the latter was to encourage young men to seek employment. The tax was raised in 1915 to 5 rupees, with certain exceptions, including the Masai, who continued to pay the old rate. In 1920 the maximum was raised to 10 rupees and this rate was imposed on the Masai, who from this time onwards have been assessed at a higher rate than the other tribes on account of their potential wealth in stock. The general rate was fixed at 8 rupees, but lower rates were imposed on certain

¹ Native Tax Ordinance 20 of 1934, sect. vii.

districts, with a minimum of 5 rupees. After the introduction of the shilling currency in 1922 the general rate was fixed at 12s., that for the Masai remaining at 20s., the equivalent of 10 rupees at the rate fixed at that time. In the years of the economic depression these taxes were recognized as constituting a very heavy burden, and on various occasions taxation was reduced or remitted in the case of tribes which were particularly hard hit. The standard rate has also been modified to meet local conditions. Lower rates, varying from 10s. to 3s., were imposed in 1935 in twenty areas. The local rate imposed by the native councils,¹ which varies from 1s. to 2s., is additional to this tax; it is payable only by residents in reserves.

The Native Hut and Poll Tax Ordinance 40 of 1934 increased the provision for the exemption of impoverished persons by making lack of means, apart from infirmity, a sufficient ground of exemption; it also provided, however, that women hut-owners should pay tax, if financially able to do so. The card instalment system on the lines adopted in Tanganyika was introduced in 1936, and has not so far met with the same criticism; it is held that it protects the native from the exploitation to which he was liable when the whole sum had to be raised at once. A proposal has been made that payment by the stamp system should be obligatory on natives in employment; it is claimed that this will automatically bring in a large proportion of the total native tax, while the employer will be free from the risk of losing his labourers owing to prosecutions for tax default. It will, however, be necessary to regulate the system in such a way that the employer does not become responsible for paying the tax by deduction from wages, a procedure which has generally been rejected in the British colonies as liable to abuse. It would appear that the proportion of exemptions granted in different districts varies more widely than can be explained by differences in economic circumstances; it is as high as 27 per cent. in Kavirondo, and as low as 5 per cent. in Kikuyu.

The original Hut and Poll Tax Ordinance provided that defaulters might be made to work on public works, one month's labour being taken as the equivalent of 3 rupees. This provision

¹ See Chap. IX, p. 391.

was little used, and was deleted in 1921 on the ground that its application might be regarded as a resort to forced labour. There is now no organized system of defaulters' labour; the penalty for contumacious refusal to pay is imprisonment, but the ordinary defaulter is sentenced to from one to three months in a detention camp, in which there is usually no organized work. In 1935 some 175 persons were sentenced to imprisonment and 8,791 to detention camps for offences under the Hut and Poll Tax Ordinance. The employment of detainees on road work was recommended by a local commission in 1936.¹ The commissioners who reported on native taxation in the same year² advised that the liability for payment should not be extinguished by a sentence of imprisonment, and that the rate should be raised by 2s. on payments made after July 31. It has been calculated that the sum of £550,000 represents a fair annual native contribution to direct taxation.³ Revenues from this source exceeded this sum in 1926-8 and 1930, the latter being the peak year with a total collection of £591,424. After a decline to £515,277 in 1932, it rose in 1933 to £557,796 and then dropped to £514,480 in 1934 and £502,302 in 1935.

Under the procedure in force up to 1934, registers were prepared annually. The Report of 1936⁴ pointed to many deficiencies in the procedure followed, and recommended a closer co-ordination between the system of registration for native control and the tax census. Tax was collected on a fixed date by the District Officer at the local native authority head-quarters; lists of defaulters were sent to the native authorities, who dealt with them with the assistance of their own retainers or tribal police.

In 1934 a beginning was made of entrusting collection to selected chiefs and headmen.⁵ Alleged abuses by these authorities were the subject of inquiry by the local commission, already referred to, appointed in 1936. It was pointed out that the native authorities with their low salaries cannot pay their retainers sufficient to overcome the temptation to corruption; there was held to be good ground for revising the salaries of headmen

⁴ *Ibid.*, p. 45-6.

⁵ See Chap. IX, p. 388.

entrusted with tax collection, and for giving them the assistance of uniformed tribal police paid by the government. As regards exemptions, the Report on Native Taxation¹ recommends the appointment each year of committees of elders to consider applications for exemption, thus making the District Officer less dependent on the advice of the headmen; it has also been represented that there is considerable hardship in requiring persons exempted on account of age or infirmity to make a fresh application each year, but a more reliable system would clearly be necessary if permanent exemptions were to be granted. Sir Alan Pim² supported the commission in its further recommendation for the appointment of special tax officers, engaged as members of the local civil service, who would be responsible for the actual work of receiving taxes, leaving to the administrative officer the function of general supervision; this would have the further advantage that the administration of justice and the collection of tax would not be in the hands of the same European authority. The arrangement proposed appears to be regarded as a temporary system, which will gradually give place to one in which the native authorities are entrusted with the collections, subject to adequate supervision by the administration; it is noteworthy that the local commission, differing from official opinion in Nyasaland, recommended that tax-default cases should be heard by native courts.

The possibility of following the example of Tanganyika in raising the age of liability for poll tax from 16 to 18 has been under discussion for some years. Lord Moyne, in the course of his inquiry made in 1932 into the finances of the colony, advised against a change on the ground, among others, that the territory could not afford a loss of revenue which he estimated at £40,000.³ The 1936 Report on Native Taxation also holds that the payment of taxes should be considered as an obligation inherent in adult membership of the tribe, which is recognized at 16.⁴ Sir Alan Pim, however, considered that the case for alteration was strengthened by the action of Tanganyika, and that the loss to

² *Report*, *op. cit.*, Colonial 116, 1936, pp. 98-9.

³ *Report*, *op. cit.*, Cmd. 4093, 1932, pp. 7-8.

⁴ G. Walsh and H. R. Montgomery, *op. cit.*, p. 49.

revenue would not be more than £20,000.¹ The Chief Native Commissioner's estimate was £25,000. The Standing Finance Committee in 1937 agreed that it did not appear practicable to defer any longer the taking of this step.

The possibility of injustice from the imposition of the hut tax on women was discussed by Lord Moyne, who rejected the proposal that no tax should be levied on huts occupied by widows, but recommended that a distinction should be made between widows capable of bearing children and those past child-bearing age. But it is clear that an exemption from hut tax in the case of women too old to be an economic asset would be unfair in its incidence unless it applied to wives as well as to inherited widows. Sir Alan Pim recommended that the additional hut tax should be fixed at half the basic rate, as it is in Tanganyika.² The local commission of 1936 recommended also that independent women hut-owners should pay the lower rate;³ the proposal was considered by the Standing Finance Committee in 1937 but postponed. It has also been proposed that the hut tax should be abolished altogether, and replaced by a higher poll tax,⁴ a measure which would certainly be free from such anomalies as arise from the assumption that the number of huts is necessarily an index of wealth, but would involve the abandonment of any principle of taxation in accordance with capacity.

Lord Moyne's proposal for the introduction of a graduated tax will be discussed later in connexion with proposals of this kind made in other territories. Another scheme for the reorganization of the Kenya system of taxation, which does not, however, provide for any graduation in accordance with individual wealth, is that two main taxes should be imposed on the native community, a poll tax payable to central revenues, to be devoted to the general cost of administration, and a local rate to be assessed and levied by native councils to meet the cost of all special services for which the councils would then assume responsibility. This scheme would provide for local reductions in rates and would make possible the establishment of native treasuries with substantial funds; the local

⁴ *Ibid.*, p. 25; *Report of the Commission upon Allegations of Abuse, &c.*, op. cit., pp. 14-18.

commission of 1936, however, considered that the difficulty of finding a basis of assessment for the local rate would make this system impracticable.¹

(k) *Uganda*

In Uganda the direct tax presents one unusual feature; it was, so far at least as Buganda is concerned, introduced by agreement. Article 13 of the Agreement of 1900 fixed the hut tax at 3 rupees or 4s.; this was changed to a poll tax and increased to 10s. in an agreement of 1910, and again raised to a maximum of 15s. in an agreement of 1920.² In the territory generally, discrimination is applied as between different districts, 10s. and 5s. being levied in the poorer areas. The native authorities are responsible for the keeping of registers and the collection of tax, exemptions being granted by the District Commissioner. The poll tax rebate payable to native treasuries is normally 20 per cent.; in Lango District and the Eastern Province it is 10 per cent.; in Bunyoro 30 per cent.

Though there is no tax on plural wives, there are other demands on the native which materially raise the incidence of taxation. The Buganda landlords have in virtue of their quasi-freehold tenure³ the right to take from tenants a rent fixed by law at 10s.; a land tax is levied by the native government on owners of more than 10 acres of land. The rate is 5s. for any landlord with fewer than five tenants; for others, 15s. or 25s. according to the district. In addition 1s. 6d. out of every rent payment is payable to the native treasury, and is in fact collected by their agents from the tenants, who themselves deduct it from the rent payable to the landlord.

Outside Buganda occupiers of land do not pay rent, but tribute ranging from 1s. to 7s., known as *busulu*, is collected for the purposes of the native administration; the maximum rate payable in combined poll tax and *busulu* is 21s. in Busoga.

A further obligation to which the male native population of the whole protectorate is liable is the provision of thirty days' unpaid labour on public works (*luwalo*) at the order of the native authorities. The obligation to maintain the roads was imposed in Buganda

¹ G. Walsh and H. R. Montgomery, *op. cit.*, p. 37.

² *Lawu*, vol. iii, p. 478.

³ See Chap. XII, p. 762.

by the Kabaka before the British occupation, and was confirmed in Article 14 of the Agreement of 1900; it is now regulated in Buganda by the *Luwalo* law of 1930; it has been extended to the rest of Uganda by the Native Authority Ordinance. The obligation can be commuted for a cash payment which varies from 4s. to 10s. Outside Buganda, persons approved by the native authority or the District Commissioner, according to the district, may be allowed to commute at half the standard rate. The proceeds of the commutation of *luwalo* are paid to the native administrations; about one-third of the adult males avail themselves of commutation in Buganda, and large numbers in the other provinces. Persons who, having opted to commute, fail to meet their liabilities by the due date, may be required to pay a fine of 10s. and to work for a period up to two months, failure to work being punishable with imprisonment; neglect or refusal to discharge the penalty within two months of due date is punishable by a fine of 20s., and the defaulter remains liable to work for two months. Exemption may be granted by proclamation, and this has been given collectively to certain classes of persons.¹ The native administrations of Bunyoro and Toro have imposed a shilling education rate.²

(1) *Nigeria*

The problems of direct taxation have played a more important part in the general policy of Nigeria than in that of any other administration; but in a great part of the territory the tax itself is a comparatively late development. As will subsequently be seen, there has always been opposition to direct taxation in the coastal areas of West Africa, and in the colony of Lagos the British government for many years contented itself with indirect taxation; when in 1895 it proposed to levy a house and land tax, the scheme met with such opposition that it was abandoned. It is noteworthy that there was even more pronounced agitation in 1915 against the imposition of a water rate to finance the city water-supply, and it was only enforced after considerable difficulty. In the western districts of the Southern Provinces the larger states were before the War controlled on a treaty basis; the administration

¹ *Luwalo Law, 1930: Laws, cap. 60, sect. vii.*

² See Chap. XVIII, p. 1240.

did not impose the direct tax on them, except in Benin, which was brought under direct administration as the result of the rising in 1897. In the eastern provinces no tax of any kind was imposed. It was not, indeed, until the system of native administration, introduced into the Northern Provinces, was extended to the south after the amalgamation of Northern and Southern Nigeria in 1914¹ that a regular system of taxation was contemplated, and the purpose of the tax was found mainly in the need for providing incomes for native rulers and funds for native administrations.²

As has been shown elsewhere,³ Lord Lugard had found in the northern emirates a strong political organization, in which the 'tribute-tax' followed the lines common in Moslem systems of rule. He regarded direct taxation as an integral feature of the system of native administration which he introduced; the revenue secured from it was to be shared with the native authorities, 'not as a dole from Government, which would destroy their self-respect, but as their proper dues from their own people in return for their work as Rulers or Judges'. The share allotted to these authorities was to replace their former tributes and also to compensate them for the economic loss involved in the abolition of the legal status of slavery; its corollary was the suppression of other forms of exaction. It was characteristic of the system that in the Northern Provinces the tax was at first collected in the name of the emir and not of the British government; it was equally a characteristic of the system that the native authorities were allowed to retain for their own purposes, or subsequently for the native treasuries, an exceptionally large proportion of the proceeds of taxation.

The first measure introduced in order to give effect to this system was the Northern Nigeria Land Revenue Ordinance of 1904, which simply directed chiefs to pay one quarter of their revenue to government; a Proclamation of 1906 provided for the regularization of the system of taxation by authorizing Residents to assess the tax and to appoint village and district heads responsible for its collection. The earlier multiplicity of dues was consolidated into two taxes, a general tax representing the variety of levies made on settled agriculturists and traders, and a cattle

¹ See Chap. IX, p. 420.

² F. D. Lugard, *Political Memoranda*, 1918, p. 167.

³ See Chap. IX, p. 417.

tax or *jangali* imposed on nomad pastoralists. The system of a flat-rate tax was rejected as suited only to communities at a low economic level where incomes are identical for the majority of the members. The tax actually imposed is described in the Native Revenue Ordinance of 1917¹ as a property or income tax; in Lord Lugard's *Memoranda* it is described as a tax 'on the income and profits of each individual', and 'profits' is defined as 'the gross income derived or derivable, regardless of the appropriation of the whole or any part of it to the use of the owner'; in the case of agriculture it means 'the yield of the land if cultivated to a normal standard'.² The ordinance does not provide for commutation by labour or service.

The imposition of a tax on income had some precedent in the system of the emirates, which had accustomed the people to pay, however roughly, in proportion to taxable capacity. The principle followed in assessing the tax from 1906 onwards was that known as the 'lump-sum assessment', which has in practice taken various forms. In its most complete form the system involves the preparation by the District Officer of an assessment report for each group of villages. The average annual cultivation of the area concerned is estimated, and a cash value assigned to it; the amount taxable is a proportion (usually 5 per cent.) of the gross value thus ascertained. An estimate is also made of other earnings, such as those from livestock, trade, and industries; it is typical that even the assumed income of the drummer, the beggar, or the seller of magic charms enters into this calculation; the amount taxable is taken as a percentage (between 2½ and 10 per cent.) of the total estimated earnings. The sum of the amounts taxable under these two heads represents the 'lump assessment' of the unit, subject to deductions which may be made in view of the condition of the units in question; it is left to the village head and his counsellors to divide the tax among different hamlets; it is again distributed over the family heads, who then make a final division over the members of the family, on their own computation of the income of each individual. The safeguard for the fairness of the final distribution lies in the public character of

¹ *Laws of Nigeria*, revised edition, cap. 74, pp. 807-12.

² F. D. Lugard, *op. cit.*, pp. 165-212.

the procedure, and in the provision of a power of appeal, which seems to be fully exercised, to the District Officer. In some of the emirates the procedure has taken a somewhat different form. In Kano the Survey Department has mapped the lands in a number of the native 'districts' in the neighbourhood of the capital, and the assessment in these areas has largely the character of a land tax, though economic earnings are also taken into consideration. In Bornu the assessment has been left largely in the hands of the native authority, which has issued individual tax-papers showing the amount assessed on each person. Elsewhere, a simple process has been followed involving merely a rough calculation of a suitable average tax per head, with an addition for the richer part of the community; in the pagan areas, a flat rate, which is in effect a poll tax, has been adopted as the only possible expedient; it is assessed separately in small units, and is varied to meet local circumstances.

In the northern emirates the system of assessment results in practice in a wide range of payment by individuals; in Bornu, for instance, the actual amount payable may vary from 1s. to 20s.; the incidence per adult male varies from 1s. 6d. to 11s. 4d.; an average over seven districts is 6s. 9d. The flat rate in pagan areas varies from 6s. to 9s., and is estimated to represent about six weeks' work for an unskilled and a fortnight to three weeks for a semi-skilled labourer. The *jangali* tax is assessed and collected when the cattle owners return with their herds to the districts in which they are deemed to be resident; the rate of the tax is now 1s. or 1s. 6d. per head, and its assessment is necessarily left to the local native authorities. Where the system of lump-sum assessment is in force there is considerable variety of practice followed in its revision. In the more advanced native administrations there is an annual revision of the tax by the native authorities, subject to a periodical inspection by an administrative officer; elsewhere village heads are responsible for such rough-and-ready modifications as may obviously be necessary, a full reassessment being made only where an administrative officer is available for the purpose. Save in the pagan areas, the collection of the tax is everywhere in the hands of the native authorities, the village heads issuing individual receipts and bringing the tax to the native 'district heads', who in turn pay it in at

the capital; the function of the administrative officer is that merely of general inspection, or the hearing of complaints. In the pagan areas he takes a more direct part in supervising the collection of the flat rate.

When direct taxation was introduced in the states of the western provinces of Southern Nigeria, after the amalgamation of 1914, the assessment of the 'income and profits tax' differed in detail from the system of lump-sum assessment adopted in the northern emirates. Thus in Oyo the tax is in theory assessed at $2\frac{1}{2}$ per cent. on the gross income of the farmer, but in view of the general equality of such incomes it actually takes the form of a flat-rate tax of 6s. a head; native traders are, however, taxed at 5 per cent. of their estimated income. In Ibadan the flat rate works out at 8s. per head; but extra charges at a fixed rate are made on owners of cocoa trees and of produce scales, or on persons in receipt of house rentals.¹ There is a similar system in Abeokuta. Under this system the calculation of the number of taxpayers is more important as a basis of revenue than as a means of bringing home individual obligations; it is made in some cases by family or village heads, in others by native authority assessment clerks.

In the large towns of these states the assessment is made by wards, the head of the ward having the same duties as the village head, usually with the advice of a committee representative of various elements in the population. The rate levied in practice in the towns is usually a fixed one for each trade or profession; in Benin, for example, letter-writers pay 20s., shoemakers 6s., and so on; there is also a rent of 5s. on strangers and a 10s. farming rent. For incomes above the average, graduated assessments are made; in Benin, for instance, incomes between £50 and £100 pay 10s., incomes between £100 and £200 pay £1, and so on progressively.

Taken as a whole the system in the south-west allows to some extent of the apportionment of tax in accordance with means, but this is mainly in respect of the charges which fall outside the general flat rate imposed on the ordinary cultivator. The incidence of the tax is 4s. in Benin, but in Abaja it is only 2s. 8d. The collection of the tax rests with the native authorities; the actual collection

¹ M. Perham, *op. cit.*, p. 182.

is made by compound heads, who on making payment to the chief receive a receipt for the whole sum, and a separate numbered ticket for each taxpayer on the list. The supervision of the District Officer is directed mainly to seeing that the total assessed amount is paid in. The system appears to work smoothly; the substantial proportion of the tax-revenue which is allocated to the native authorities serves to maintain their interest in the completeness of the assessment and the collection of the tax; it has been estimated, for instance, that in Benin only some 3 to 5 per cent. of persons liable manage to escape taxation. On the other hand, the right of appeal to officers of the administration affords a safeguard to the individual assessee.

In the south-eastern provinces the direct tax was not introduced until 1928; the only obligations imposed on the native population up to that date took the form of providing labour for public works on the orders of the native authorities. Lord Lugard considered the imposition of a tax in 1914, but abandoned the proposal.¹ The question of reforming the system of native administration came under discussion in 1924 and 1925, and it was decided to impose direct taxation as indispensable for the creation of native treasuries. The original proposal was for a poll tax; this was rejected in favour of the extension of the Native Revenue Ordinance then in force in Northern Nigeria and the south-western provinces; it was proposed to take $2\frac{1}{2}$ per cent. of the average income of the peasant farmer as the rate of tax. Assessment began in 1927, and was followed by disturbances, which were repeated on a larger scale during the attempts made to collect the tax in 1929. As has been shown elsewhere,² the inquiry made into the causes of these disturbances, generally known as the 'Aba riots', pointed not merely to dissatisfaction with the tax, but to discontent with the existing system of native administration. The steps subsequently taken to reorganize that system, and the working of the native treasuries since instituted, appear to have been successful in removing the causes of discontent, and the tax is readily collected by the native authorities now recognized. The assessment has in practice taken the form of a flat rate, varying in different localities; its general incidence, according to one

¹ M. Perham, *op. cit.*, p. 203.

² See Chap. IX, p. 424.

estimate, averages about 4s.¹ per adult male, though in one area the figure is as low as 1s. 6d. per adult male.

The study of the development of direct taxation in Nigeria is of especial interest, partly owing to the intimate relation of the tax to the local system of native administration, and also because it represents an effort, on a larger scale than in any other African territory, to adjust native taxation to the capacity of the individual taxpayer. The lump-sum assessment, which permits of the most effective range of graduation, is of course applied in its complete form only in certain areas of Northern Nigeria; elsewhere the tax tends to take the form of a flat rate. Though the flat-rate tax is also described as an income and profits tax, and is theoretically based on an assumed percentage of gross income, it is clearly not based on any actual calculation of individual income, nor does it vary with it. It has, however, the advantage, as compared with a general poll tax, that the rate can be, and in many cases is in practice varied between comparatively small units, in reference to their local conditions. Again, the system followed in taxing urban natives, though it is not a true tax on income, nevertheless allows of a substantial degree of variation between persons practising different crafts and trades. The procedure in lump-sum assessment bears some resemblance to the method followed for calculating the land revenue in India, though in the absence of a land survey, or the registration of holdings or any record of crop statistics, it necessarily partakes more of the nature of the early 'summary settlements' in India than of the later land revenue settlements, which are based on a wide range of recorded data. It is actually designed rather to differentiate between the general taxable capacity of the various units under assessment than to give an accurate calculation of their income. On the other hand, it shares with the Indian system the advantage that it involves close contact between the assessment officer and the people, and compels him to make a detailed study of their material and social conditions. It has the further advantage that the system of distribution over family groups and individuals gives the people themselves some share in the assessment, and, as has been observed, acts to this extent 'as a binding rather than a dissolving force upon the com-

¹ M. Perham, *op. cit.*, p. 248.

munity and its constituent families'.¹ It has therefore definite benefits, apart from the flexibility in the incidence of the tax. The extent to which it can be regarded as suitable for adoption elsewhere in Africa will be considered later.

(m) *British Cameroons*

In the British Cameroons the system of taxation follows generally that of Nigeria, the provisions of the Nigerian Native Revenue Ordinance having been extended to the mandated territory. In the northern areas the procedure of lump-sum assessment is followed, though in a relatively simple form. In the Moslem areas the village or hamlet is the unit; in pagan areas each tribal area is subdivided into units in accordance with the indigenous social organization. The lump-sum assessment is in theory a proportion of the gross income of the ordinary farmer, though, as has been remarked in dealing with Nigeria, a calculation of this nature can be only a rough approximation; it is, however, varied year by year as the result of a census of population and livestock carried out under the supervision of the administrative officer, the detailed record being prepared by a census scribe. Before the lump sum is fixed the administrative officer takes into account factors such as the character of the harvest or state of prices; when it is announced it is distributed over the individual taxpayers by the village head and his elders, or by the village council, as the case may be. There seem to be few disputes as to the fairness of the distribution. In the more advanced areas there is a substantial measure of differentiation in the tax as distributed; in the more primitive areas it approximates to a poll tax, though even here a difference is sometimes made between persons of varying taxable status. In Dikwa and Adamawa about one-third of the total tax is derived from the *jangali* or cattle tax, which is paid at the standard rate of 1s. 6d. per head of cattle. In 1936 the incidence of the general tax in the three districts of the northern areas amounted to 3s. 3d., 3s. 4d., and 4s. 6d. per adult male; this does not include the cattle tax, which for the most part is paid by those who do not pay the general tax. Collections of the tax are made by village

heads or representatives of local councils; individual receipts are not given unless requested for a particular purpose. There seems little difficulty in realizing collections.

In the Cameroons Province the system of lump-sum assessment has now gradually given way to that of a flat rate, which appears to be considered preferable by the people themselves. The rate is assessed annually for each group of villages; in some districts the method of assessment is explained to be a study of the wealth of the people, as shown by estimates of production and expenditure, as a result of which the 'wealth of the average adult male' is computed.¹ Elsewhere, what is described as a more advanced system is adopted, namely, the careful assessment of a typical individual, on which the assessment of other similar individuals is based. In view of the strength of the administrative staff and of statistical material available, it is clear that such computations cannot pretend to any accuracy; the merit of the system lies in the fact that assessments are made as the result of an annual inspection of each unit, and admit of a substantial measure of variation in the light of local conditions. In the four divisions of the Cameroons Province the incidence per adult male in 1935-6 was 6s. 1d., 7s. 9d., 4s. 11d., and 3s. 3d., the tax in some units of the Bamenda Division being as low as 1s. and rising as high as 8s. in some units of the Victoria Division. The nominal roll of taxpayers is compiled by the village heads under the supervision of the native chiefs or councils, but is checked by the District Officer in the presence of the village elders.² Collections are made by the native authorities, and in the Cameroons Province individual receipts are given; this seems, indeed, to be one of the reasons for the local preference for a flat-rate tax. All the evidence goes to show that collections are in normal years made without difficulty. The allocation of the tax to native treasuries is in the proportion of 50 per cent.

As in the colony of Nigeria,³ a sliding scale of income tax at similar rates is here also imposed on natives with 'ascertainable incomes'; it is practically confined to the Victoria Division, where advisory income-tax assessment committees were instituted in 1935;

¹ *Report to the League of Nations on the Administration of the Cameroons under British Mandate*, 1935, p. 22.

² *Report to the League of Nations, &c.*, 1936, p. 32.

³ See above, p. 578.

apart from the salaried employees of government or commercial firms, only fifty-five Africans in that division are assessed to pay more than the flat rate.

(n) *Gold Coast*

The account given elsewhere of the policy adopted in the Gold Coast in regard to native administration¹ shows that there has been a very slow development of the institutions which normally accompany the extension of administrative rule. That is true not merely of the application of a judicial system, or of regulation of land transactions, but also of the imposition of direct taxation. Hitherto, the Gold Coast has imposed no direct tax in its southern territories; a considerable part of its resources is contributed by the export duty on cocoa, the greater proportion of which must fall on the native producer, but it has also a large income from customs on imports. At an early stage of its history, before the development of the cocoa industry, it sought to raise revenue for the extension of education, medical aid, and communications by means of a poll tax of 1s. on each man, woman, or child resident in districts under British protection; for this purpose an agreement, called the Poll-Tax Ordinance, was concluded in 1852 with the chiefs concerned. Great difficulties, however, were encountered in its collection; the ordinance was for some years in abeyance, and was repealed in 1866. As has been explained in the chapter already quoted, the question of the imposition of a direct tax has more than once been considered, as a means of introducing a system of native treasuries, and of replacing the levies and other irregular methods by which native authorities now finance themselves; so far, however, no final decision has been taken on the question.

In the Northern Territories of the Gold Coast the policy in regard to native administration has followed different lines, and a system designed to assign to native authorities a position similar to that in areas under indirect rule was introduced in 1932.² There had, up to this date, been an obligation to provide unpaid labour on road³ works, and it had been customary for most of the chiefs to collect tribute; some imposed levies for various public purposes,

¹ Chap. IX, pp. 465-77.

² *Ibid.*, p. 477.

³ See Chap. XI, p. 620.

such as education or the maintenance of native authority police. Ordinance 10 of 1932 provided for the levy of a tax, here named a tribute tax, since it replaced the traditional tribute in kind, and this was first collected in 1936. The principles indicated for the first assessment were similar to those adopted in Northern Nigeria, and the result gave a rate of 2s. to 7s. per adult male; but as it would not have been possible to collect tax at this rate unless a high proportion was accepted in kind, the rates were scaled down to the amount which could be paid in cash. This process gave a rate which varies from 1s. to 5s. The tax in practice assumed the form of a capitation tax, though varied in its incidence between different units. The nominal rolls of taxpayers were prepared by District Commissioners, on the introduction of the tax, on the basis of the 1931 census returns; the Native Treasuries Regulations make the native authorities responsible for collection, and they appear to have already shown considerable efficiency in this respect, though there are still cases in which the District Commissioners have to collect the tax, in company with the representatives of the chiefs concerned. The proceeds of this taxation are paid wholly and directly into the native treasuries.

(o) *British Togoland*

In the area which is now British Togoland the Germans had imposed a direct tax, but, on accepting the mandate, the British administration followed the system adopted in the Gold Coast, under which the state confined itself to indirect taxation. In the southern section of the mandated territory there is still no direct tax; the subject of taxation by native authorities, with the view of instituting native treasuries, has been frequently discussed, but so far only the Akpini State Council has introduced an annual levy for this purpose. The levy is small in amount and voluntary, in the sense that it is not enforceable under regulation.

In the northern section a number of native authorities had before 1934 instituted native treasuries, but, with the exception of Mamprusi, where a tax of 1s. a compound was levied, their resources were small, as they were financed only by court fees, tolls, rents, and the like. It was felt that native administration had reached a stage which justified the imposition of a tax, not

merely in order to provide the treasuries with resources, but in order 'to impress on the individual his liability to contribute to the social services of the community of which he is a member'. Regulations¹ were passed providing for the imposition of a tax, called, for the same reason as in the Gold Coast, a tribute tax, of which the whole profit would accrue to the native treasuries, and the first collections were made in 1936. It is a flat-rate tax, assessed on the estimated average income of the individual farmer, but varied in accordance with the economic condition of different units; the maximum rate levied is 2s. 6d., and the minimum 1s. It is payable only by adult males. In one area, Gonja, the tax takes the form of a lump assessment,² which is apportioned over family groups on the system followed in Nigeria.³ Collections are made by the native authorities, and were in 1936 effected with an ease which seems to show that the people appreciate the value of the tax, as a means of providing the treasuries with funds for expenditure on the improvement of their local conditions. In accordance with the original scheme of 1934 all proceeds of the tax are paid direct to the native treasuries.

(p) *Sierra Leone*

In Sierra Leone there are two different systems of direct taxation. In Freetown and Sherbro District a rate is assessed on the value of house property; in the rest of the colony and in the protectorate there is a direct tax which has a history of some interest. The ordinance which established the protectorate over the hinterland in 1896 required every chief to collect and pay to the government a tax of 10s. a year for each house with four or more rooms and 5s. for each house with three or less rooms. The attempt to collect this tax led in 1898 to violent disturbances, in the course of which a number of Creole traders and some European missionaries were murdered. An inquiry subsequently made by a special commissioner, Sir David Chambers, condemned the tax as obnoxious to the customs and feelings of the people,⁴ and Mary Kingsley, who had consistently supported the policy of indirect as against

¹ Regulations, no. 5 of 1934, under Native Treasuries Ordinance, 1932.

² Order 1 of 1937.

³ See above, pp. 578-9.

⁴ *Report on the Subject of the Insurrection in the Sierra Leone Protectorate, 1898*, Cmd. 9388, 1899, p. 73.

direct taxation, assisted the movement initiated in England for the abolition of the tax. The British Government, however, decided to maintain it, though at a reduced rate of 5s., and it is still levied, under the name of house tax, at this rate. It is collected by the chiefs, who are also responsible, under the supervision of the District Commissioners, for the preparation of the tax lists; the chiefs receive a rebate of 5 per cent. of the collections. It is noteworthy that both Sir David Chambers and Miss Kingsley had emphasized that the levy of taxation implied in native eyes an assertion by government of proprietorship over the object taxed. The argument has been used elsewhere, in particular in West Africa, as an objection both to a hut tax or a tax based on land. Whatever strength this sentiment may have ever possessed, it may be doubted whether it carries the same force at the present time; experience has shown that the incidence of the tax, and the manner of its assessment and collection, are considerations of greater importance in determining the attitude of natives towards it. It should be added that in Sierra Leone the chiefs are entitled to levy tribute on their own account, the rate of which is in some areas fixed by government; the tribute is collected by village headmen, and is usually paid to the chiefs in the presence of the District Officer. The substitution of a system of native treasuries, on the lines adopted in Nigeria, is, however, under consideration.¹

(g) *The Gambia*

In the Gambia the yard tax is in effect a tax imposed on the compound as a unit. The rate is 5s. on a yard containing not more than four huts, with an extra 1s. 6d. for each additional hut. A further 2s. is payable for every person resident in the yard who is not a member of the family; this rate is raised to 8s. if the person is cultivating land. The whole of the tax is paid into general revenue.

(r) *French West Africa*

In the French Colonies direct taxation has two elements, the capitation tax and *prestation*; as will be shown in the chapter dealing with Labour,² *prestation* is capable in many areas of com-

¹ See Chap. IX, p. 482.

² Chap. XI, pp. 624-6.

mutation for cash payment; in such cases it is in effect an addition to the capitation tax. The latter is imposed on all natives who are not *citoyens français*; there are exemptions, however, in favour of natives in military service, students, and aged persons without means. In French West Africa the rate is fixed in each colony by local *arrêté*, and there is a considerable difference between the rates imposed in each district. Originally the incidence was low, with a maximum of 16 francs and a minimum of 1 franc; but it was imposed on all individuals, including women and children above the ages of 8, 10, or 15 years, according to the colony. In Senegal the *Conseil Colonial*¹ protested more than once against these age limits, and in 1921 the minimum age was raised to 10 for that colony; it has since been raised to 14 in all parts of French West Africa except Dahomey, where it is 16. The average rates were raised considerably in the period following the War, but during the governor-generalship of M. Brévié, which coincided with the worst period of the economic depression, they were again reduced, the combined average of capitation and livestock taxation per head falling from 39 fr. 80 in 1930 to 29 fr. 80 in 1933.

The livestock tax or *pacage*, which is of the same nature as the *jangali* of Nigeria, was imposed in Senegal, Mauretania, the Niger, and the Sudan. It affected principally the horses and cattle of the pastoral tribes, and the goats of the more sedentary tribes. It was discontinued, except for nomad tribes, in many areas in 1935, the capitation rate being slightly increased, and in 1936 was abolished in all colonies except the Niger, where it was considerably reduced.² In Mauretania, the French have adopted the Moslem system of a *zakkat* tax, fixed at one-tenth of the value of all animals, and an *achour* (usher) tax, which is a tithe of all cultivated products; the tribal areas in which this system is in force do not pay the capitation tax.

Assessment of all taxes is mainly in the hands of the chiefs, who are responsible for compiling the tax registers, subject to supervision by administrative officers; but the check exercised is, in view of the strength of the staff available, necessarily in-

¹ See Chap. VI, p. 197.

² *Discours prononcé par le Gouverneur Général à l'ouverture de la Session du Conseil du gouvernement*, 1934, p. 28; 1935, pp. 32-3; 1936, p. 30.

sufficient. In 1933 it was decided to appoint a number of special census officers,¹ part of whose duty would be to carry out a more careful assessment, but by 1935 this had been done only on an experimental scale in Guinea. Assessments for the livestock tax are based on declarations made to chiefs, though indirect sources of information are utilized, such as records of division of herds on the death of the owner, or complaints of defective registration by potential heirs. Each man is responsible for the stock in his charge, whether or not he is the owner, a measure which prevents evasion, but has the effect that the incidence of the tax is not necessarily proportionate to individual wealth. There would seem to be a lower proportion of efficiency in the assessment of this tax than in that of the capitation tax.

Collection of both forms of tax is made by the chiefs, who on making payment are given the appropriate number of receipts for distribution, in some areas in the form of disks (*jetons*), but the administration does not itself keep a record of individual taxpayers, a fact which inevitably places very considerable powers in the hands of the chiefs. The chiefs receive a rebate on collection which varies from 3½ per cent. in Dahomey to 10 per cent. in parts of Mauretania; in the Sudan they receive 2 per cent. of the capitation tax and 10 per cent. of the livestock tax. A system of payment by instalments is in force in Dahomey. Here the head of each family is responsible for the contributions of its members, and on presentation of any sum at the administrative headquarters can obtain stamps representing the amount paid. A record of the amount is kept at head-quarters by means of counter-foils, so that the progress of collection can be estimated at any moment.

(s) *French Equatorial Africa*

In French Equatorial Africa the system is now similar to that of French West Africa. The tax imposed in the earlier days of administration took the form of a delivery of goods in kind, ordinarily rubber, of the value of 3 francs per individual, a regulation made mainly in the interests of the concessionaire companies, whose abuse of the privilege was largely responsible for the move-

¹ See Chap. IV, p. 123.

ment which resulted in the curtailment of the concessionaire system. In 1909 the rubber tax was abolished in favour of a capitation tax, to be paid in cash; payments in produce were to be made only in exceptional circumstances. The tax is varied by districts; the minimum in 1935 was 15 francs and the average perhaps 30 francs; but the lack of transport or opportunities for wage-earning gives to the tax a higher real incidence than in French West Africa; its real incidence is further enhanced by the fact that it is payable by both sexes. It has been mentioned¹ that there has been difficulty in maintaining the administrative staff at the necessary strength, and the cadre has more than once been quite inadequate to conduct the necessary supervision over the assessment of the tax and its collection by chiefs; even in normal times this seems to be noticeably less than in French West Africa; save in the towns, where a nominal roll is kept, no tax receipts are issued. The chiefs are authorized to retain 5 per cent., reduced in proportion to delay in collection. It has been admitted on good authority that the collection of the tax has in some years involved much pressure and some abuses; it was indeed described as the 'nightmare of every official', and as constituting in some areas a 'real disaster for the natives'.²

(t) *French Cameroons*

In what is now the French Cameroons mandated territory, German taxation was based on the imposition of a labour tax limited to thirty days, but commutable for cash. The French administration has substituted a *prestation* and also imposed a capitation tax; as in their other African colonies, the rate is varied by districts. Natives are divided for the purpose of assessment into classes according to the nature of their employment and status; the minimum payable is 37 francs and the maximum 70 francs, including a medical tax of 10 francs, which has since 1934 been combined with the capitation. The tax is payable by both sexes over 14 years and under 60; school pupils, soldiers, and women having more than five children living are exempt. Assessments are made after

¹ See Chap. VI, p. 241.

² M. Archimbaud, *Rapport du Budget Général, Ministère des Colonies, 1925, Chambre des Députés*, no. 518, p. 356.

consultation with chiefs of districts and a council of notables; the collection is made by chiefs. There is a closer supervision exercised over tax procedure than in Equatorial Africa.¹ The floating population, including foreign natives, pay the tax at rates of 40 francs for men and 30 for women.² Natives in towns are also subject to a tax on house property and rent on the same basis as Europeans, and a cattle tax of 3 francs per head is payable in the cattle-owning areas in the north of the territory.

(u) *French Togoland*

In the French mandated territory of Togoland all natives of both sexes have to pay tax, except married women, infirm persons, scholars, and soldiers. The amounts due are graded by income, which is assessed after consultation with a council of notables. Natives whose income is less than 4,000 francs pay from 7 to 20 francs, according to the district. Incomes from 4,000 to 7,000 francs pay 70 francs and incomes exceeding 7,000 francs pay 110 francs. In addition, there is a percentage tax on the higher incomes, ranging from 1 per cent. on incomes in excess of 10,000 francs to 3 per cent. on incomes exceeding 100,000 francs. Until 1937 there was also a medical tax; for incomes over 10,000 it was 70 francs, and it was between 5 and 12 francs in the lowest category, according to district. In the lowest category the payer receives a metal token as a receipt for payment; the superior categories have their payments entered on a nominal roll and receive receipts. Chiefs collecting the tax receive a payment up to 10 per cent.; the government holds the chiefs responsible for a lump-sum payment. A system of *prestation* is in force for labour on works of public utility; payment for commutation varies from 1 to 10 francs, according to districts; the number of days of labour is fixed from time to time and has varied from 4 to 6. Chiefs also receive 10 per cent. of their collections of the exemption payments. A tax on urban house property from 4 to 2 per cent. is assessed by a committee on which native notables are represented. In a reply to the Mandates Commission the average native taxation in 1935 was given as 9 fr.10 per head, European as 251 francs.

¹ See Chap. IX, p. 490.

² *Arrêt* of Sept. 14, 1933.

(v) *The Belgian Congo*

The early history of taxation in the Belgian Congo presents some points of resemblance to that of French Equatorial Africa; the labour tax imposed by the Congo Free State, though limited in theory to forty hours a month, was in practice unlimited in duration; it took the form of a forced collection of rubber for the benefit of concessionaire companies, or the state. One of the first efforts of the Belgian government after its assumption of control was to remedy the abuses of the labour tax system; it passed in 1910 a decree¹ providing that taxes should be paid only in cash, and a capitation tax was imposed on adult males with a supplementary tax for each additional wife. The rates of this tax are fixed locally and may be reduced or increased from time to time or suspended altogether even during the period of collection; exemptions and rebates are given to encourage large families.² Defaulters are employed on public works for two months; only persistent defaulters are imprisoned. In 1933 defaulters numbered 40,000. The rates vary from district to district; in the Katanga area, from the equivalent of 1s. 6d. to 8s., the average being 2s. 6d., with 1s. 3d. for additional wives; in the Congo-Kasai from about 6s. to 7s. 6d. and 3s. for additional wives. The entire proceeds of the tax are paid into general revenue. Native local treasuries are financed by a further contribution calculated as a proportion, usually 10 per cent., of the capitation tax. The fact that the administration has at its disposal a large cadre of *agents territoriaux* enables tax procedure to be carefully regulated. Assessment of tax is based on a census; each taxpayer holds a *carnet d'identité* on which entries of payments are made, and a metal token is also issued to him. Native collectors tour the villages, but their duties are confined to book-keeping and calling payers to certain points, where payment is made directly to the administrative officer; the assistance of the native authorities is also utilized for the same purpose, but the chief takes a less important part in assessment and collection than in the French or in some of the British territories.

¹ Decree of May 2, 1910.

² *Codes et lois du Congo belge*, 1934, p. 1370.

IV. CONCLUSIONS

There is a striking difference in the manner in which direct taxation affects Europeans and Africans. The amount due from the European is usually related to his financial capacity, and where this is not so the flat rate does not impose a heavy burden, save on a very few of the poorest; it must seldom be the case that a European has to work merely to earn his tax. In the case of the native, taxation introduced a money economy into his life which had no relation to his traditional ideas of wealth, and, where the incidence of taxation is based on his capacity for earning the money rather than actual wealth or income, it causes a dislocation in his life, and forces him into an activity in which he would not otherwise engage. While it would not be correct to say that taxation is to-day the main reason which induces the native to seek work,¹ the persistent and recurrent demand by the authorities for money for taxation necessitates a continual individual effort which has little counterpart with Europeans.² The problem of native taxation is, therefore, not merely one of securing that the incidence of taxation should be related to the financial capacity of the individual; it is no less important that an administration should study the social consequences of the burden which it is imposing. The effect of tax systems on the native population, such as the dislocation of native society owing to the migration of adult males, amounting in some areas to 50 per cent.;³ the drift of the population to urban areas; the consequences of the prosecutions for tax default; and the difficulties of collection, involving the administrative officer in activities which cannot but prejudice his relations with the native population, provide sufficient arguments for the need for the most careful consideration of the form which native taxation should take.

It will have been seen that, of the areas dealt with in this Survey, only one, the southern territory of the Gold Coast, has been able to dispense with a direct tax; apart from the exigencies of general revenues, the growing needs of the native treasuries effectively

¹ See Chap. XI, p. 648.

³ *Report of Committee appointed to Inquire into Emigrant Labour*, 1935, p. 36.

commit other governments to the retention of some form of direct taxation. It will be recognized, moreover, that in some areas, such as Nigeria and the northern parts of the Gold Coast and British Togoland, as also parts of Tanganyika, it has been possible to justify taxation as relieving the peasantry from exactions by the chiefs. It has been deemed advisable to give in the course of the present chapter some details of the rates imposed in each area, but comparison even of the cash incidence presents considerable difficulty. Thus the average rate of the direct tax imposed by the French administrations appears moderate in relation to that in force in many of the British colonies, but in view of the fact that the tax applies to most women, and to large numbers of children, it is necessary to refer to the incidence per head of the population as a basis of comparison. The figures are given on page 547, but they, of course, afford material only for comparing the cash incidence; an elaborate study of wages and prices would be necessary to establish the relative real incidence.

It is correct to say that of recent years administrations have shown themselves impressed by the need for moderation in native taxation; there has been no general tendency to increase the prevailing rates, and, partly as a result of the experience gained during the period of depression which began in 1929, there has in most areas been a movement towards a greater discrimination in assessment. It is perhaps true to say that at the moment the procedure followed in taxation demands more attention than the pitch of the rates imposed. This fact lends special interest to the differences which the previous study has revealed between the methods pursued in Nigeria and those in other parts of Africa. In Nigeria among a comparatively stabilized population, most of whom have a ready market for their produce, it has been possible to introduce systems of taxation, varied from district to district, which do not unduly disturb the social and economic life of the people, and as the incidence of taxation is based on lump-sum assessments distributed by native authorities over individual taxpayers, or, in less advanced districts, over villages or groups of villages, there is considerable fluidity and scope for variation according to individual or collective wealth.¹ In Central, East, and South Africa, on the

¹ See above, pp. 578 ff.

other hand, there were, when taxation was first imposed, large areas in which the population was not stabilized in the same sense as in British West Africa, nor was the general economy directed in the same degree to the growing of saleable crops. Uganda may be said to form in some sense an exception to these general conditions, and, as has been seen, its system of taxation actually shows a certain degree of differentiation. But elsewhere taxation has taken the form of hut or poll taxes, imposing a rigid flat rate over whole countries, as in the Union of South Africa, or over districts, as in the East African territories; further, assessment is based on a general estimate of the African's capacity to pay and of the sum required to be raised, rather than on any estimate formed of the wealth of the community; nor is any attempt made to vary the incidence of the tax according to the financial capacity of individuals or small groups, except in the case of a few large incomes. As the history of labour policy given in Chapter XI shows, the flat-rate tax was at one time deliberately used in order to produce a supply of labour for the mining and farming industries; and though other inducements have now in great part taken the place of the tax as an incentive to wage-earning, it still remains the fact that, where African taxpayers are unable to grow saleable crops, the effect of a rigid flat rate is to drive the tax-paying male population to industrial and urban centres, and consequently to disorganize native society to such an extent that, on several occasions, governments have felt obliged to reduce the amount to be paid by men who are without resources other than their labour.

The advantages of a flat-rate tax lie in its relative ease of assessment; the operation should involve little more effort than the preparation of an accurate population record. It is contended again, with some justice, that, as the administration of Northern Nigeria felt when preparing to tax its pagan areas, the flat rate is the only type of tax possible in very backward conditions. There is, finally, some ground for the contention that, even in more advanced areas, the equalitarian sentiment of African society supports a uniform tax. But, as a matter of practical administration, the success of this type of tax may be said to be in inverse proportion to its incidence; its difficulties increase with every step it takes above a figure so low that it has little fiscal value; and, as the

period of depression has proved, it is singularly ill-adapted to meet changes of conditions due to climatic or other vicissitudes. Not the least of its difficulties is the effect which, especially at such periods, its collection inevitably produces on the relations between the people and the administration.

Apart from these difficulties of an administrative nature, it is clear that if a tax is so pitched that it is capable of being paid by the poor, it must be unduly favourable to those who are better off; and in many areas African social economy already shows signs of a growing measure of differentiation. It is probable that if any radical change of system were feasible more than one administration would be glad to adopt it. It may be possible that there are some areas where society is sufficiently stabilized, and the growth of saleable crops sufficiently advanced, to justify the adoption of the principles of taxation followed in Nigeria; Uganda and some other areas round Lake Victoria suggest themselves as possibilities. But there are clearly many areas where this is impossible, and in particular those devoted to cattle-breeding. As has been seen, the case of the pastoral nomads has been met by the *jangali* or an equivalent tax in British and French West Africa; the feasibility of imposing a cattle tax in the more settled conditions of East Africa has been more than once investigated, but the difficulty has been considered insuperable, owing to the complications arising from African customs regarding the ownership and use of beasts, and because such an innovation might offend the sentiments of natives.¹ The need for closer study of native conditions and resources before any direct taxation either of cattle or of property could justly be applied is evident.²

In the absence of means for approximating taxation to individual incomes, a number of governments have now for some years sought to adjust the incidence of the tax by graduation between districts, or even smaller territorial units. Though this has not been attempted in South Africa, it is, as will have been seen, now usual in East Africa, and in the French and Belgian colonies; the latter, indeed, would appear to have carried differentiation down to smaller units than those commonly adopted in the British prac-

¹ *Report*, op. cit., Colonial 116, 1936, pp. 39-42.

² *Report of Native Economic Commission*, 1930-2, U.G. 22, 1932, pp. 97 ff., 224 ff.

tice. The system has very obvious advantages, though at the same time it involves some anomalies; the residents of a 'poor' district, to which industrial wage-earning is easily accessible, may actually be better off than those of an area with better agricultural conditions. Moreover, the investigation made into the possibilities of further graduation of taxation in Tanganyika¹ has shown that even in a country with a relatively simple economic organization the problems presented are numerous and complex. Tax laws provide for exemptions on a variety of grounds, economic and personal, but they cannot, under the present system, take into account the diversity of economic activities and degrees of earning capacity which differ from group to group, nor the varying capacity to pay determined from time to time by fluctuating export prices and wage levels.

Apart from questions connected with the system of territorial graduation, attention has also been directed to a number of minor schemes for securing a better adjustment of the tax. Some of the African governments, however, seem to hesitate to run the risk of the loss of revenue which might result from experiments to remove inequalities in taxation. Thus taxation on additional huts for women is retained, although it is becoming increasingly open to doubt if the assumption that plural wives indicate wealth, and additional capacity to pay is actually a satisfactory basis of taxation. In some territories, again, the age at which youths become liable to taxation is not raised, for fear of loss of essential revenue;² circumstances can hardly justify the diversity of practice observed in deciding when African youth is capable of doing a man's work. There seems also some reluctance to experiment in the methods for paying tax by instalment, which was at one time recommended for adoption by the conference of East African Governors.

A further factor of importance in the operation of the tax is the method adopted for assessment and collection, particularly in regard to the association of native authorities in these processes. The previous pages show that a great variety of practice prevails. Many administrations would no doubt desire that as large a part as possible of this type of work should devolve on native authorities; but there is, in the first place, an essential difference between the

¹ See above, p. 570.

² *Report*, op. cit., Colonial 116, 1936, pp. 37-8.

areas with a fully stabilized and self-supporting population, and those in which for economic or other causes large numbers of persons have to migrate in search of wages. The issue is also affected by the extent of the association established between the tax and the revenues of the native administration treasuries. In Nigeria, the northern parts of the Gold Coast, Uganda, and parts of Tanganyika, where the people raise their tax-money by selling their crops, and rarely leave home to work for wages, the collection of the entire native tax by the native authority is possible, and, as the payment of a percentage of the tax can be made easily and immediately to the native administration, the people can see the direct benefit of taxpaying within their own areas, and the payment of tax-money can be intimately linked to the system of local native government. Elsewhere, however, where large numbers of taxpayers are away from their homes for long periods and pay at their place of work, it is clear that a large part of collection must be effected by government agencies; the alternative which has been mentioned above, of the payment of a basic poll tax and a separate cess, would possibly impose an extra burden on the payer who is able to find his money at home. The position of the native taxpayer has also to be considered; he must naturally desire to be rid of his obligation in the quickest way while work is in hand, and we have seen that governments recognize the importance of collection from migrant labourers by making special arrangements at the place of work.¹

Even in the most favourable circumstances, success in the employment of chiefs or other native authorities in assessing or collecting the tax must depend on the character of the supervision exercised. The experience gained in British areas has shown indeed that even the removal of collection from the native authorities into the hands of agents of the administrative officer does not always protect the payer from oppression, and that where the native authorities can be entrusted with collection it is still necessary for the register on which collection is based to be in the hands of the administrative officers. The most significant feature of the French system is the part taken by the chiefs in assessment and collection. The greater part of their personal emoluments are received from the rebate

¹ See above, p. 562.

on tax collections, a fact which has clearly affected their attitude in voting for increases of taxation in the Senegal *Conseil Colonial*. In the debates of the *Conseil* it has been asserted that they frequently fail, when preparing assessment lists, to take account of deaths and migrations, in order that they may retain the percentage on the total sum due when the village was assessed. It is clear, again, that a system which does not provide for check over the issue of individual receipts is liable to abuse; and there are complaints that in certain French areas chiefs collect tax without issuing receipt tickets. The use of native authorities in the assessment and collection of tax is, of course, common in British territories also; but there is this much difference, that where the system of indirect rule prevails the allocation of a portion of the tax accrues to the benefit of the native treasury and not to the chief personally. A procedure such as that adopted in French areas, if it is not to bear harshly on the individual, needs closer official supervision than is always available in some of the areas concerned. In the Belgian system the chief takes a relatively minor part in the proceedings.

In urban and industrial populations there appear to be two classes of taxable persons. The first might be looked on as a semi-permanent population which has no intention of returning home; the second is composed of migrant labourers who intend to return to native areas as soon as they have earned sufficient money. There are many opportunities for taxing the first class according to financial capacity, but little attempt seems to have been made in the industrial centres of South and East Africa to form registers or make assessments on which the incidence of taxation could be based. The difference in circumstances among the urban populations in the Union must be very considerable; farther north there is a growing settled population in non-native areas, and the imposition of rigid flat rates must produce anomalies which might be corrected if a careful assessment of individual or group capacities were made. The second class is frequently required to pay at the rate applying to the place of work after it has been away from home for a comparatively short period; an investigation into industrial conditions in Uganda¹ led to the conclusion that the home rate

¹ *Report on an Investigation into Industrial Conditions Affecting Unskilled Labour in Uganda, 1937*, para. 107.

should be paid by the migrant unless he becomes a permanent resident; should any extra taxation be imposed on the migrant on account of his wage earnings or of local obligations in the urban area, it might take the form of an immigrant tax or a local cess; where a percentage of tax is paid to the native treasury, this system would allow for more easy distribution than would be the case if the migrant paid the local district rate.

In some of the British areas tax collection has frequently involved administrative officers in tasks as burdensome as they are unwelcome; if there is not the same complaint of the burden of 'tax-hunting' from French territories, it must be remembered that France does not, like Britain, publish reports in which administrative officers are given liberty to express their views. Such activities are undoubtedly prejudicial to an officer's more important functions, and occupy an undue amount of his time. More detailed systems of assessment would occupy his time more profitably and involve less risk of impairing his relations with the people. Nor would revenue necessarily decrease under a more fluid system of assessment, except in cases where the African community has been expected to produce more than can be justly demanded from it. If it be decided in any area to undertake inquiry with a view to improving the system in force, a useful precedent is afforded by the detailed investigations in conjunction with the native authorities which were made in Nigeria preparatory to making the tax assessments, and have been attempted to some extent in Tanganyika. If detailed assessments are attempted in East and South Africa, although individual assessment based on the actual ascertained income of the taxpayer may be impossible at the present stage, it might well be found possible to vary the rate within the district or group, in order to take into account, to a greater degree than has been attempted so far, not only the markets for local crops, the accessibility to labour markets, and the rate of wages earnable, but also the circumstances of certain classes of the community, such as elderly craftsmen and those of poorer physique. These investigations would possibly not only allow a greater degree of fluidity than at present, but also provide studies of native land tenure or conditions of cattle-owning which would in time allow for a further modification of the incidence of

tax, in closer relation to actual financial capacity. They would also allow rigid forms of exemption to give way to partial exemptions based on ascertained incapability, which might help to discourage the migration of persons to urban areas in the hope of obtaining work for which they are obviously not suited.

CHAPTER XI

THE PROBLEMS OF LABOUR

I. INTRODUCTION

(a) The General Nature of the Problems

ON a first view, the distinguishing feature of labour problems in Africa is the inadequacy of the supply of labour to the demand. In some areas this was probably due to the drain on the population from the slave trade in all its branches. African slave labour built up the cotton and tobacco industries in the United States and the sugar industry in the West Indies, while the great deficiency of indigenous labour in Africa has been a noticeable factor not only in its economic but in its political history; and few of its territories have escaped incidents arising from the difficulty of obtaining manual labour in modern economic conditions. The importation by the Dutch East India Company of convict and other labour from its Far Eastern settlements gave the Cape its 'coloured' problem, and the use of indentured Indian labour on the sugar plantations of Natal from 1860 onwards added a new complication to the population problems of the Union.¹ The revelation of the shortage of labour available for the internal development of French West Africa had a decisive effect in modifying the views of that section of French public opinion which saw in the African colonies an inexhaustible reservoir of recruits for the French armies, and the use of Chinese labour on the Rand had reactions which reached as far as the field of British party politics. Railway construction in the French Congo, and in early times in the Belgian Congo, presented painful evidence of the abuses which may attend the resort to forced recruitment in order to supply the deficiency of voluntary labour. If some of these incidents are characteristic of an era which is now passing away, the deficiency in the labour supply still gives rise to problems which are of no little importance both to employers and to the administration.

¹ See Chap. VIII, p. 319.

Another class of problem, of a wider character and of greater importance to the African, is being created by the social consequences of the demands which modern capitalist organization is making on a population whose institutions had hitherto been those appropriate to a subsistence economy. Elsewhere the rapid growth of industrial conditions has produced its reactions on the social organization, but the conditions have seldom been such as to demand an adjustment so sudden or so radical. In Europe the Industrial Revolution marked in effect only the substitution of large-scale processes for domestic or small-scale industry. The change in the character of industry brought with it all the difficulties in social adjustment that result from the quick growth of industrial centres and the substitution of urban for rural life, but it did not produce a problem of adjustment in the basic conditions of life so marked as that which followed the introduction of industrial conditions in Africa. Again, in Japan a capacity for rapid readjustment has given the transition to industrial conditions almost the appearance of a natural evolution; while in India the introduction of modern capitalist enterprise caused little social dislocation in a population which was already experienced in small-scale industries, the production of marketable crops, and the employment of wage-earning labour.

The introduction of capitalist undertakings in Africa found a population that had little incentive to improve its subsistence by wage-earning, and since it was inexperienced in the use of money it was slow to react to the stimulus of cash inducements. The entry of the African into the new economic field was therefore difficult and hesitating, all the more because those who controlled that field were Europeans or Asiatics. Native societies had their own systems of economic organization, the obligations of which were well recognized, but the discipline of regular labour in compliance with the orders of those who had no traditional authority was unfamiliar to them. The practice of slavery had also left a legacy which created suspicion against the new relationship of employer and wage-earner. But the difficulties have not been limited to those attending the entry into a new relationship; the extension of employment has created for the native a series of problems which are far-reaching in their effect on his social life. Even when the

new employment does not remove the wage-earner from contact with his own community it gives him a new economic independence; he is no longer dependent for the essentials of life on close co-operation with his kindred; and when it involves long absence, it is liable to be disruptive of those intimate personal bonds which are the ultimate source of moral restraint.

The migration of large numbers of the male population from their homes to distant places of work is one of the characteristic features of the labour question in Africa. Migrations even on a larger scale have accompanied the introduction of modern enterprise elsewhere; for instance, the development of jute and cotton factories in Calcutta and Bombay, of tea in Assam and Ceylon, and of rubber in Malaya; but in Africa the effect has perhaps been more conspicuous owing to the social consequences involved, and the new problems in health which have been created through the native's susceptibility to disease on any change of his environment.¹ The aggregation of industrial populations has created new problems also in administration, for the labourer passes out of the range of his own customary law and the authority of the tribal organization.² While, therefore, the gradual extension of wage-earning following the expansion of new economic conditions may solve some of the problems of employers, and may also make it unnecessary for administrations to maintain some of the special regulations now in force, the growing entry of natives into a wage-earning economy will tend to enlarge the range of the social problems which it has already created.

It will be convenient first to give some view of the range of these problems as indicated by the numbers of natives now employed in different territories as wage-earners. It is proposed next to consider the questions which are connected with the supply of labour for state or public purposes; except, perhaps, in the Union of South Africa, these were the problems which at the outset occupied the chief attention of administrations. In dealing with them it will be necessary to consider the native custom under which those in management of tribal or group affairs could call for

¹ See statements in *Report of the East Africa Commission*, Cmd. 2387, 1925, p. 43; *Journal officiel de la république française*, 24 novembre, 1927, p. 3185; and *Deuxième Congrès Belge, Bruxelles*, 6 et 7 février 1926. *Comptes rendus et Rapports*, pp. 71-2; also Chap. XVII.

² See Chap. IX, pp. 496 ff.

communal labour, for, as will be seen, the existence of this custom has facilitated the exaction by the administrations of labour for public purposes. The use of compulsion for stimulating native production, whether in the form of subsistence or marketable crops, will next be considered; it is in some sense complementary to the use of 'communal' labour. The methods used in securing workers for private purposes fall into a separate category. Their study will involve some mention of the past influence of slavery, and a description of the special regulations which at the present time control recruitment or provide penal sanctions for breach of labour contracts. Passing from the problems connected with the use of labourers for private employment, it will next be necessary to study the legislation regulating the treatment of workers in respect of health, welfare, and the like, and the administrative organizations created to deal with labour questions.

(b) The Number of Natives Employed as Wage-earners

No complete statistics are available on this point, and such information as it is possible to give has often only an illustrative value. Professor J. F. W. Grosskopf¹ calculated that in 1933 there were 856,184 male natives occupied within the industrial system proper of the Union, of whom 36,026 were in a higher group, including police, clerks, and shop assistants, and the remainder in various classes of manual labour. In January 1937 the number of non-Europeans employed in the South African mines was 393,213, and the agricultural statistics of 1930 showed 475,909 natives as employed on farms, of whom 114,610 were females. In view of the increase in mine labour since 1931, it is probable that the wage-earners in the Union now amount to about 1,250,000,² though it is not possible to distinguish those who are entirely dependent on wage-earning from those who combine it with cultivation.

The Southern Rhodesia census taken in 1936 gave a total of 254,297 natives in employment, of whom only about 42.5 per cent. were Southern Rhodesian natives. In Northern Rhodesia the number of natives employed in the colony was given in 1936 as 53,462, while the number of Northern Rhodesians employed outside was

¹ *Weltwirtschaftliches Archiv*, no. 38, Oct. 1933.

² See Chap. XX, p. 1362.

put at 51,212,¹ though this is probably an under-statement. The Annual Report for Nyasaland for 1929 indicated that 108,000 natives were in employment: there are no later figures published, but the Committee on Emigrant Labour (1935) put the total number of natives employed out of the territory as about 120,000. In Tanganyika the number employed in 1936 was given as 252,106; in Kenya it was estimated in the same year that 182,858 were in regular employment. Uganda gave in 1936 the number of persons employed as 50,636, but the figure seems to exclude the large numbers who come into temporary employment in the cotton-picking season.

In Nigeria the figures given officially in 1936 were 227,451, and in the British Cameroons 18,120. In the Gold Coast the official study based on the census of 1931 gave the Africans employed in industry as 12,769, and those engaged otherwise than in industry as 121,656, but these include certain classes, such as hawkers and artisans, who are not necessarily wage-earners.² In 1934 the official statistics showed 11,319 in general employment and 23,642 in the mines; in 1936 the average daily mining labour force was 34,774. In Sierra Leone 9,445 natives were in mining employment in 1935. There are no complete figures available for British Togoland or Gambia.

In French West Africa in 1935 the number of wage-earners was 178,908, of whom 23,608 were serving under written contracts. In French Togoland in 1936 wage-earners numbered 1,719. There are no figures for French Equatorial Africa, but the number of labourers in the French Cameroons was given in 1935 as 53,604. The Belgian Congo in 1936 gave a total of 409,274, divided as follows: natives employed at a long distance from home, 127,319; at a short distance, 135,315; and near home, 146,640. In Ruanda-Urundi the figures for 1936 were 11,177 as permanent and 31,681 as non-permanent employees.

The figures which it has been possible to quote, incomplete as they are, have certain other defects. They give for the most part only the numbers in regular employ by companies, individual European or Asiatic employers, or in government undertakings;

¹ *Report on the Financial and Economic Position of Northern Rhodesia*, Colonial 145, 1938, para. 93.

² A. W. Cardinall, *The Gold Coast*, 1931, pp. 170 ff.

they must in many cases exclude the numbers of more casual wage-earners and those in the employment of natives, who have in some areas begun to employ labourers for wages, as in Uganda, or for other considerations, as in the Gold Coast, where workers are allowed the usage of land and a share in the profits realized. The chief deficiency of these figures is that they do not, and in the circumstances cannot, provide any basis for calculating the proportion of the population which is dependent on wage-earning. In many types of employment, such as the gold-mines of South Africa, the labourer is not accompanied by his family, which draws its subsistence from its own cultivation. Again, in some cases wage-earning is undertaken only for the sake of meeting the native tax or for personal expenditure, with the result that only a small part of the earnings goes to the support of the family. On the whole, it may be said that the greater part of native Africa is mainly engaged in its own subsistence economy; a further but smaller proportion devotes itself mainly to the production of marketable goods, and only a small proportion is at present dependent solely on wage-earning.

II. COMMUNAL AND COMPULSORY LABOUR

(a) *The Customary Use of Communal Labour*

Native society in Africa appears to have recognized in most areas the custom of supplying labour for common purposes, such as the clearing of paths or bush, or the destruction of mischievous animals. It was also well recognized that the chief or group leader had a claim not only for some form of tribute, but for communal labour for certain purposes connected with his own position. This custom has had two developments, both of which have had their influence on the subsequent history of labour in Africa. The customary use of 'communal' labour for tribal purposes will be seen to have been the basis of the procedure adopted by early administrations in securing labour for a great variety of public uses, and the practice of rendering service to chiefs was subsequently used by the latter to secure resources for personal expenditure on other than communal purposes. It will be simpler to deal first with the latter development, for it is one which has remained

within the field of native custom, and has not had the same influence as the former on the wider field of employment for public purposes or private uses.

The services rendered to a chief, whether in the form of tribute or by way of labour, were not entirely directed to enabling him to maintain his own position; they also served communal purposes in so far as they enabled him to meet his customary responsibility for providing tribal hospitality, for maintaining the destitute, or for laying up a reserve against times of scarcity.¹ When needs were simple this obligation was scarcely felt and readily rendered. But with the growth of a money economy these services acquired a cash value, and the chief, in addition to securing a personal income from tribute in kind, was able to count also on the receipt of what was practically a tax in the form of labour. At the same time his purely personal expenditure increased and absorbed much of what would formerly have been devoted to the discharge of tribal obligations. The process was one for which analogy can be found in the steps by which in Europe the feudal lord, or the owner of a manor, was enabled to realize in the form of rentals what were originally obligations of the nature of personal service.

The extent to which the demand for labour by African chiefs has constituted a real burden has varied widely in proportion to the strength of their political position, and since the discharge of the obligations has rested within the field of native custom, it is not easy to estimate the extent of the labour actually engaged. Some typical cases may, however, be quoted. The reservation to the chiefs in Basutoland of a large area of land, the *Tsimo ea lesa*, cultivated by free labour (*letsema*), was no doubt little felt when the number of chiefs was limited and the chief used the proceeds mainly to discharge his tribal responsibilities, but it became a substantial burden when a large increase in the number of chiefs followed from the adoption of the practice of 'placing' members of the ruling families. The Laws of Lerothodi² empowered the chiefs to summon labour to cultivate their lands, and the increase of the days of *letsema* from four to twelve produced complaints

¹ I. Schapera in *Western Civilization and the Natives of South Africa*, 1934, p. 25.

² See Chap. IX, pp. 396 ff.

with which the government was forced to deal. In Bechuana-land the regimental system is a survival from the days when military service was required by the chief and entry into a regiment followed on the youth's passing through initiation ceremonies and so assuming the responsibilities of manhood. It now survives as a convenient organization for compulsory tribal labour and has been used to call out labour for a variety of tasks, including the building of a mission church, the construction of an aerodrome for government, and even to assist a chief in collecting arrears of hut tax by rounding up the cattle of defaulters. Since 1934 the usage of this compulsory labour is defined by proclamation.¹ Again, in the French Cameroons the large farms which the Germans encouraged the chiefs to maintain, and which still exist, must necessitate the use of a large body of compulsory labour. One of these chiefs maintained at one time a force of police which was in part used to secure this labour. In Sierra Leone the Forced Labour Ordinance of 1932 (section 4) contains detailed provisions relating to personal services for recognized chiefs, and provisions of a general nature are found in the Ashanti Labour Ordinance of 1935, the Gold Coast Northern Territories Labour Ordinance of 1935, and the Nigeria Forced Labour Ordinance of 1933. Personal services are prohibited in the Gambia, Kenya, and Tanganyika.²

As has been shown elsewhere,³ the existence of this practice was one of the factors which weighed with the British administrations in their decision to adopt a system of assigning salaries to chiefs in substitution for the right to take tribute or free service, and though chiefs may in some cases still have sufficient influence to secure labour on their own lands, the practice appears to be decreasing in most of the British areas; it is, perhaps, only in the High Commission territories that it presents a question of any importance. It has been mentioned that in Northern Rhodesia the former right of the Barotse paramount chief to labour was commuted for an annual payment of £2,500.⁴ The salaries paid to chiefs in the French colonies are not given in lieu of tribute and

¹ Proclamation 74 of 1934.

² For general powers of chiefs, see Chap. IX, *passim*.

⁴ *Report of East Africa Commission*, Cmd. 2387, 1925, p. 96. See Chap. IX, p. 458.

services: the question of services to chiefs remains of considerable importance in certain of the French areas.

The Geneva Convention of 1930 dealing with forced labour allows only chiefs who exercise administrative functions to enjoy personal services, if they do not receive adequate remuneration in other ways, but necessary provisions must be made to prevent abuses. It also permits this class of chiefs to levy compulsory labour for the execution of public works of direct interest to the community, subject to special safeguards, but at the same time it provides that this form of compulsory labour is to be progressively abolished, and prohibits chiefs who are without administrative functions from using it in any case.¹ The report prepared in connexion with the convention drew attention to the possibility of the misuse of their powers by the chiefs, for instance in the employment of customary labour in growing crops for sale; it referred to the attempts made by the Ruanda-Urundi administration to direct the use of this labour to social ends, such as the construction of roads, and recommended that these principles should be adopted for general use.²

(b) *Labour for Communal Purposes*

Passing now to the uses which have been made of the customary practice of supplying labour for the common purposes of the tribe, it was perhaps natural that the early administrations should see in the use of this 'communal' labour an easy method by which to provide for the making of roads or for the transport necessary for official purposes. It became, indeed, the usual method of securing labour for official or public needs; the procedure took the form of a notice to the chief to provide labour, and the purposes for which such labour was required seemed to carry their own justification. There were special cases in which the practice rested on a more definite basis than this general assumption; thus in the more developed conditions of the Buganda kingdom the construction and maintenance of roads was a recognized duty falling on the community, and the Buganda Agreement of 1900,

¹ International Labour Conference: *Forced Labour Convention*, 29 (1930), Article 7.

² International Labour Conference, Twelfth Session, 1929: *Forced Labour Report and Draft Questionnaire*, pp. 141, 293.

in allowing the chiefs to call on peasants to provide thirty days' *luwalo*,¹ or communal labour on the roads, merely gave a precise form to this obligation. For the most part, however, the construction of the early road system of Africa was effected by the use of unpaid labour obtained without recourse to formal obligations of this type.

It is, of course, the fact that at certain stages of social development the use of 'communal' labour for making and maintaining roads has been almost universal. In England the well-known Act of 1555² enlarged 'an ancient and customary service' by placing a statutory obligation on the parish, where each resident was obliged to render Statute Labour and Team Duty, the limit being six days' free service. The practice of fining those who failed in their duty gradually gave way to a general usage of commutation, but it was not until 1835 that the formal obligation to render statutory labour was abolished in England. In Scotland it lasted till 1883. France had in the same way its spring and autumn *corvée*; Turgot attempted to abolish compulsory work on the roads in 1762, but the peasant preferred service to taxation, and the system of *prestation* is still in force, the limit being three days' service, commutable to tax at option. In Africa, labour for the making of inter-village paths and local earth roads was for the most part easily obtained; it was only later, when requirements increased, as, for instance, for roads suitable for motor traffic, and when the growth of the habit of wage-earning caused a demand for unpaid labour to be resented, that regulations were made which prescribed such labour as obligatory, and defined its scope. Typical regulations of this kind were those adapting the *luwalo* system of Buganda to the needs of road-making in other parts of Uganda, or the Kenya Roads in Native Reserves Ordinance of 1910, which provided for a shorter period of labour than the Uganda rule, or the Belgian Congo decree of December 5, 1933, restricting the use of labour of this type to village purposes, which term, however, was held to include the building of village rest-houses and schools. It is not necessary to describe in detail the regulations passed at this stage; they existed side by side with other regulations designed to secure labour for major public

¹ See Chap. X, pp 575-6.

² 2 & 3 Philip and Mary, ch. 8.

works, including the construction of railways, and it is not always easy to distinguish the operation of this dual series of regulations. With changed conditions and an improvement in the standards of rule the original regulations have, as will be seen, been modified in the direction both of limitation of scope and definition of purpose.

(c) *The Use of Compulsory Labour in the past for Purposes other than Communal*

It has been mentioned that, while utilizing 'communal' labour for the purpose of making roads, the administrations had found themselves at the same time under the necessity of taking steps to secure a supply of labour for state purposes, such as the construction of railways, or major roads for long-distance transport, which were outside the range of even an extended definition of communal labour, more especially since they at times involved the absence of labourers from their homes for considerable periods. Labour so requisitioned was, however, distinguished from 'communal' labour in that it was remunerated. The use of impressment has not, of course, been confined to Africa; it was, for instance, at one time a recognized practice in French Asiatic colonies and in British India, though in the latter case it was practically confined to securing transport for military purposes. It must be recognized that the construction of railways would have been impracticable in Africa without some use of compulsory labour. The building of the Uganda Railway necessitated the use of labour imported from India; in 1885 the French Government was driven to import Annamites for work on the communications near Brazzaville; it brought labour from Cuba in 1909, and on at least two occasions attempted the importation of Chinese; labour was employed by the Congo Free State for the Lower Congo Railway from countries as far apart as China, the Barbados, and Liberia. Apart, however, from the expense involved, health conditions made it impossible to rely on a general recourse to labour of this type, and the use of impressed African labour became in many areas imperative.

The construction of railways affords the most conspicuous instance of needs which were held to justify impressment, but

administrations sometimes required labour for works of other kinds, and powers were taken in a variety of forms to secure it. In French West Africa, labour for the Thiès-Niger, the Cotonou, and Dahomey Railways was secured by an executive order directed to the chiefs, and in French Equatorial Africa the demands for the Brazzaville Railway were met by the issue of a series of local *arrêtés* which distributed the levy by districts. In the French Cameroons labour for the extension of the railway which the Germans had constructed as far as Njock, and for harbour and road construction, was secured by a system of 'collective contracts' with chiefs, a system which was justly criticized as involving an extreme form of compulsion; in Togo it was levied under instructions issued by district authorities. In none of these cases, therefore, were any legislative safeguards provided. In the Congo Free State the decree of 1906 authorized the carrying out of public works by the second section of the annual levy of the militia, the provision being that the workers could be called upon to perform a maximum period of two years' service. A large number of labourers was secured by these means for the construction of the Great Lakes Railway. The decree of February 16, 1910, passed after annexation, was designed to reduce the period of service of these workers, and the repeal of the decree was implied by the terms of the decree of May 10, 1919, which provided for the reorganization of the *force publique*, but made no reference to the use on public works of persons conscripted. Meanwhile, however, labour was secured by a process of official recruitment which had in practice most of the elements of impressment. The system had many abuses, and a proposal was put forward by the Minister of the Colonies in 1926, and approved by the *Conseil Colonial*, to regularize by law the levying of labour for the Leopoldville-Matadi Railway, but this was rejected by the Belgian Government as contrary to the *Charte Coloniale*. Though the government had thus refused to sanction a formal impressment, the informal levying of labour continued until the completion of the railway.

In the British areas the Natal Native Code allowed for the use of compulsory labour, which was widely used on the roads until this provision of the Code was abolished in 1906. In Uganda the

Native Authority Ordinance of 1919 regularized the use of compulsory paid labour (*kasavu*) for sixty days in the year, and was widely applied in the construction of the road system; a similar statute in Kenya, the Native Authority Ordinance, 1922, allowed the use of compulsory paid labour for the same period for works sanctioned by the Secretary of State; under this ordinance labour was secured for the Uasin Gishu Railway, and it was also extensively used on road work. Nyasaland passed a similar ordinance in 1924, but natives were exempted who had been 'fully employed in any occupation' for three of the preceding twelve months. In Nigeria the needs of the Baro-Kano and the Eastern Railways were supplied by the use of 'political' labour, a contingent being demanded from each province.¹ An effort to substitute voluntary labour broke down in 1924, and resort was again had to the use of 'political' labour.

The wide use made of impressed labour for railway construction in Africa has, in the past, led to many incidents which have reflected grave discredit on the administrations. There was, in many cases, a failure to provide either statutory safeguards regulating the use of impressment or the necessary supervision over recruiting operations; in other cases no precautions were taken to maintain the health on the journey to the place of work or during the stay there of the labourers so employed. The consequent suffering and dislocation of life were undoubtedly great. At a relatively late date, the death-rate in some cases, as on the Ivory Coast and the Matadi and Pointe Noire Railways, was exceedingly high; the mortality on the Uasin Gishu section of the Kenya Railway, though less in proportion, was for a time such as to attract much criticism in England. In the construction of the Thika-Nyeri and Yala-Kisumu railway lines, there was a noticeable improvement in the method of obtaining labour and the care of the employees. The cessation of railway construction since the depression period and the increase in the supply of voluntary labour, made possible by the improvement of motor communications, have resulted in the practical cessation of the demand for impressed labour for public works; and it is to be hoped that, should any occasion arise

¹ *Report by the Rt. Hon. W. G. A. Ormsby-Gore on his visit to West Africa*, Cmd. 2744, 1926, p. 133.

in the future for the use of large bodies of men, the lessons afforded by past experiences will not be overlooked. Every effort should be made to ensure the fullest possible resort to voluntary labour and the careful safeguarding of the conditions of any obtained by other means.

(d) *The Present Position in regard to Compulsory Labour.*

It is now possible to pass to a statement of the extent to which present-day legislation recognizes methods of compulsion in order to secure labour for communal or public purposes. The Union has no regulation which admits of the use of compulsory labour for administrative purposes, but, like other areas, it utilizes the labour of prisoners, including those convicted of tax default. In Natal the Locust Extermination Act of 1904 allows of an element of compulsion for this special purpose. The supply of any labour required for communal purposes is left to the operation of native customary law. In the British colonies Lord Milner's dispatch of 1920¹ laid down that natives might be required to perform certain paid work for government—namely, works of a public nature—subject to the express proviso that no native should be required to perform such work for more than sixty days in any one year, and that any native who was fully employed in any occupation, or had been so employed during the preceding twelve months for a period of three months, should be exempted from such labour. Mr. Churchill's dispatch of September 5, 1921,² supplemented these instructions in remarking that it had always been recognized that recourse should not be had to compulsory labour for government purposes unless this was absolutely necessary. It added that work essential to the life of the community must be carried on, and the administration must have the necessary powers to call out labour for essential services; for the future, however, the use of compulsion for other services than portage or transport must receive the prior sanction of the Secretary of State. A White Paper published in 1925³ showed that the Secretary of State had refused to sanction the further use of compulsory labour for the Uasin Gishu Railway; and added that experience had proved the inferiority of work under a system of compulsion,

¹ Cmd. 873, 1920.

² *Kenya*, no. 1353, 1921.

³ *Kenya: Compulsory Labour for Public Purposes*, Cmd. 2464.

which also tended to discount enterprise and progress by diverting attention from the possibilities of labour-saving machinery. The Joint Committee of Parliament appointed to consider the Report on Closer Union in East Africa noted that forced labour was still sometimes used on government work; while not denying that such labour is almost invariably in the interest of the natives themselves, the committee felt that the practice was no longer in accordance with the ideas of modern civilization, and should be discontinued.¹

The regulating policy in the British colonies and protectorates is now that laid down by the Geneva Convention of 1930, which was ratified by His Majesty's Government on June 3, 1931. Some details of the provisions of the convention are given later in this chapter.

In Basutoland and Swaziland the use of compulsory labour is confined to certain tribal obligations, but chiefs are, in practice, required to lend assistance in certain emergencies such as those arising from locust invasion. In Bechuanaland resort is had to the system of 'regimental labour' for tribal and government purposes; as has been mentioned,² the term 'tribal purposes' appears to have received a somewhat liberal interpretation. In Southern Rhodesia there is no law or recognized custom permitting the exaction of forced labour as defined by the Geneva Convention: the Native Affairs Act requires active co-operation in matters of public urgency, such as the destruction of locusts or the prevention of grass fires, and also provides that all natives shall comply with reasonable and lawful requests made by administrative officers as well as chiefs or headmen, which are to be made with due regard to native law and custom. The British report on the application of the Geneva Convention for 1936 states that no forced labour, as defined by the convention, was permitted in Southern Rhodesia in that year.

Similarly, in Northern Rhodesia the Native Authority Ordinance 9 of 1936 authorizes compulsory labour in cases of emergency, and for the maintenance of village roads; the latter provision presumably falling under the convention's definition of 'minor services'. In practice, requests are made by District Officers through the chiefs for portage or labourers for government purposes, but how far the labour may be described as forced

¹ H.C. 156, 1931, para. 106.

² See above, p. 610.

is doubtful. The Nyasaland Ordinance 11 of 1924 requires every adult male native to give labour for the construction or maintenance of any works of a public nature for the benefit of the native village or area. The labour is unpaid, but is limited to twenty-four days in any one year. The ordinance also sanctions the use of compulsory labour at the current rate of wage on works of public utility which have been previously approved for the purpose by the Secretary of State; labour can be required only from able-bodied adult males, and is limited to sixty days per annum. Administrative officers may also give orders for the supply of porters for official use, or for work for the benefit of the village in an emergency; the sanction of the Secretary of State is not required for the use of labour for these purposes. The British report for 1936, already referred to, states, however, that in Nyasaland no forced labour was employed otherwise than on minor communal services.

In Tanganyika the Native Authority Ordinance of 1926 authorizes native authorities to requisition labour, paid at the ruling rates, up to sixty days per annum for essential public services; and it also sanctions compulsory anti-famine cultivation. The Governor's Memorandum of March 1927 requires his consent before labour can be called up, with the exception of that required for portage or loading of steamers or repairs of bridges in emergencies. The annual reports show some variation in the use of these powers in recent years, due in part to the curtailment of public works on account of the depression, and also to the increase of motor transport. The British report for 1936 shows that 4,278 porters were requisitioned by government for 13,726 days, and 186 other workers for 1,516 days during that period, and that, on behalf of the native authorities, 325 porters worked for 548 days and 76 other workers for 1,455 days. Porters, if requisitioned, are paid at a fair daily rate, and the distance and load which may be required of them are severely restricted.

In Zanzibar the decree of December 4, 1923, which was similar to that of Nyasaland, was repealed by Decree 1 of 1931, whereby Zanzibar became the first of the tropical countries to abandon forced labour. In Kenya the employment of forced labour is regulated by Ordinance 42 of 1932, and in defining 'compulsory labour' due regard is had to the terms of the Geneva

Convention. The Governor may authorize administrative officers to impose compulsory labour on able-bodied men for government portage or public works only where voluntary labour is unavailable and the work is of direct interest to the community; other conditions include the exemption of certain classes of natives, such as school teachers, the limitation of the period of employment to sixty days, and rules regarding pay, feeding, and medical supervision. The British report for 1936 shows that forced labour in that year was confined to the employment of 2,698 porters for a total of 5,502 days. These figures may be compared with those for 1925, when some 15,240 men were employed on portage and other work at an average of five days each. In Uganda the Native Authority Ordinance empowers chiefs to require work (*luwalo*) from able-bodied males for the benefit of the community;¹ the period is limited to thirty days a year. The Governor may issue orders to chiefs respecting compulsory cultivation for relief work, and compulsion may be resorted to for portage or labour for public works; in the latter case, the sanction of the Secretary of State is required. The total period of work must not exceed sixty days. A Memorandum of 1923 laid down that forced labour could only be employed under narrowly defined conditions; in particular, it was not to be called out at harvest or seed time. The 1936 annual report states that no forced labour has been employed by the government since 1927. For the year ending September 30, 1936, however, 339,977 men, presumably *luwalo* labourers, were employed by the native administrations for a period of one month or less on public works, and 20,258 men were employed for short periods as porters. In removing such large numbers of men from the free labour market, the *luwalo* system depresses wages, and it is proposed to convert the obligation into a money-tax levy payable to the native administrations, the rate to be fixed first at 60 and then at 50 per cent. of the existing commutation rate; at present the option to commute is in force in every district except one.

In Nigeria the Forced Labour Ordinance of 1933 is the effective law regarding forced labour. It prohibits all forced labour as defined in the Geneva Convention except for transport purposes and as personal services for chiefs; the conditions in which such

¹ See Chap. IX, p. 450, and Chap. X, p. 576.

labour may be employed are those laid down by the convention. The Native Authority Ordinance allows native authorities to requisition native labour for public purposes and for any purpose approved by the Governor. The annual reports make no mention of the use of these powers. In the British Cameroons no forced or compulsory labour, as defined by the convention, has been employed recently, and the annual report for 1935 refers to an ample supply of voluntary labour. In the Gold Coast the relevant laws are the Gold Coast Colony Labour Ordinance of 1935 and Ashanti Labour Ordinance of 1935. Under this legislation Provincial Commissioners in the colony may require native authorities to maintain their roads; able-bodied men are liable for this service subject to a limit of twenty-four days a year, payment being made at local rates. Compulsory labour, as defined by the convention, however, is no longer employed in Ashanti or the northern territories, and in the colony it is regarded as a temporary expedient. The Gold Coast provisions have been applied to Togoland, but there is no evidence that they are now being used there. In Sierra Leone the Forced Labour Ordinance of 1932 regulates the rights of chiefs to engage forced labour. Labourers for personal or public services may be engaged for thirty days only. Personal services for the upkeep of chiefs' farms may be commuted for cash or for a share in the crops. As from December 31, 1935, the use of forced labour for road work has been abolished. In the Gambia the Forced Labour Ordinance of 1934 abolishes all forms of forced or compulsory labour as defined in the convention.

While forced labour is being progressively abolished in most colonies, or is being confined to the services excluded from the definition in the convention, it must be noted that a considerable amount of labour is available for government purposes, from tax defaulters or in lieu of payment of tax. In Tanganyika and Uganda natives may give their services instead of paying tax in cash; in these and in other colonies tax defaulters serve sentences of imprisonment in labour camps, and tax-relief schemes, such as that in Northern Rhodesia, allow natives to liquidate arrear taxes by working for government for a specified period. In Tanganyika, during the year 1936, the number of men performing labour in lieu of payment of tax was 31,605 employed for 1,285,352 days,

and in 1935, tax-relief schemes in Northern Rhodesia provided 4,626 man-months work.

In the Belgian Congo there is now, as has been shown, no law which permits the general requisition of labour for public works, but the decree of December 26, 1922, empowers administrative officers to requisition labour on payment as porters or paddlers; the period of employment must not exceed fifteen days a month or twenty-five days a year. Natives so requisitioned may provide substitutes at their own expense. The decree of March 19, 1925, further defines this authority, and local instructions, characteristic of the attention now paid in the Congo to labour policy, prohibit the use of portage where other means of transport are available, or for the carriage of certain classes of heavy goods. In addition, the decree of December 5, 1933, enables local officers to levy compulsory labour to combat infectious diseases or famine, or in other emergencies; this authority may also be used, though for the exclusive benefit of the inhabitants, for compelling the cultivation of foodstuffs or exportable produce. The period of employment is limited to sixty days a year. This agricultural levy must be preceded by a survey of local conditions, and sanction must be obtained to a definite scheme. The decree also allows the use of compulsion for cultivation for 'educative' purposes, a system to which further references will be made.¹ The Belgian Congo publishes statistics of the manner in which labour obtained from various sources is employed, but they do not distinguish that obtained under these regulations. During the depression period there was a temporary reversion to portage on a considerable scale; in normal times there is a wide use of motor transport. Road work is now mainly in the nature of maintenance, which does not involve the removal of natives from their homes to the same extent as does new construction. The local regulations allow of recourse to tax-defaulter labour, and in 1933 tax defaulters numbered 40,000, many of whom were used on road labour. In Ruanda-Urundi, as in the Congo, there is no law authorizing the use of forced labour for public works. The requisition of porters is regulated by an ordinance of February 28, 1935; 1,919 men were employed as porters in 1935.

¹ See below, pp. 633-4.

The general law relating to the use of forced labour in French West and Equatorial Africa is the decree of August 21, 1930. The use of customary labour for communal purposes receives less recognition than in some British colonies, but the decree allows compulsion for minor communal village purposes described as 'les travaux de village consacrés par la coutume de la collectivité intéressée et faisant partie des obligations normales de la vie de la communauté'. The decree avoids the expression *travail forcé* in speaking of forced labour, in view of its possible confusion with *travaux forcés* (penal servitude), and replaces it by the expression *travail public obligatoire*; this is defined as service for which any person has not offered himself voluntarily, exclusive of service arising out of military or fiscal obligations, and of sentences imposed by law; the only other compulsory service exempted from the application of the decree is compulsory service in emergencies (*force majeure*) and the communal services already mentioned. The extent of its use is to be determined by local regulation, subject to the condition that it is employed for the exaction of labour for works of public interest only. Regulations have been issued in French West Africa (two orders of February 18, 1933), and in French Equatorial Africa (order of May 29, 1933). The decree would presumably be resorted to only if occasion arose for the exaction of compulsory labour on major public works, such as railways. Special local regulations would be necessary which, in the terms of the decree, would require the sanction of the Colonial Ministry. There is no evidence that it is at present utilized, and it is recognized that obligatory labour should be replaced by voluntary labour as circumstances permit.

Where labour is required for public purposes the French administrations have depended in the first instance on the system of *prestation*,¹ which it is now proposed to abolish gradually in favour of a money tax; also reliance, though to a much smaller extent, is placed on the use of the *deuxième portion* of the forces conscripted for military purposes, and, as in other colonies, usage is made of tax-default labour. Some use also appears to be made of the law relating to *vagabondage*. The early law, dating

¹ See below, pp. 624-6.

from the abolition of slavery in 1848, placed *vagabonds* at the disposal of the state for employment on public works, and they are now treated as cases falling under the *indigénat* regulations.¹ In the French Cameroons and Togo, local *indigénat* regulations prescribe penalties for disobedience to requisitions made in emergencies or for 'essential public works': there are also rules defining the conditions under which portorage can be requisitioned.²

In the Portuguese colonies native labour conditions were formerly regulated by the decree of October 14, 1914. This reaffirmed the general principle of the obligation to labour, and effect was given to this in practice by the use of the sections of the Portuguese Civil Code, which punished vagrancy. A native not having a fixed place of abode or means of subsistence, and not habitually engaged in any profession, occupation, or trade, was liable to be required to work either for the public services or for a private employer. On failure to comply with these orders he was liable to be sentenced to 'correctional' labour. The duration of compulsory labour varied from three months to one year; that for correctional labour from 8 to 300 days. In addition, however, administrations had the right to requisition from chiefs the labour needed for works of public utility within the territories of those chiefs, in practice limited to the construction and maintenance of roads. A further regulation applied a system of *prestation* similar to that in the French colonies, which exacted labour dues commutable for a money payment. The details of these general regulations varied in the different colonies, but in every case the law prescribed that compulsory labour on state works should be remunerated at fixed rates, and provided with minimum standards of housing, clothing, and diet. Natives sentenced to correctional labour received only food and clothing. The basic law now in force is the Native Labour Code of December 6, 1928, which restricts the use of forced labour to public purposes for which sanction must be obtained from Lisbon; by the Order of April 11, 1930, all such labour must be paid. The *Decreto Lei* of November 15, 1933, reaffirms the authority to requisition labour for public works, and also for the production of marketable crops. There are no figures available for the use made of these powers. In Angola

¹ See Chap. VII, pp. 290-1. ² P. Dareste, *Traité de droit colonial*, 1932, vol. ii, p. 539.

the most recent regulation dealing with the system of *prestation* is *Portaria 1860* of 1935, which requires every adult male native to work five days a year on public undertakings; the labour may be commuted for a cash payment at rates fixed by local decree. Reference will subsequently be made to the facts relating to the recruitment from Portuguese territory of the large body of labour required in the Rand mines.

(e) *The System of 'Prestation' in French Colonies*

Prestation is a tax payable in the form of a definite amount of labour which is redeemable in cash. It provides a large amount of labour for public purposes, and also produces appreciable revenue; there are, indeed, some conditions in which the latter aspect tends to become almost as important as the former. It is applicable to all inhabitants, with certain limited exceptions, and is not a tax on natives only. Its character may be illustrated by a study of the terms of the *arrêtés* of January 1, 1934, November 9, 1935, and January 13, 1937, referring to Togoland. These lay down that the tax is due from all able-bodied males, whether European or native, between the ages of 18 and 50, exception being made in favour of various officials and students; the maximum term of labour is ten days. The cash equivalent for the purpose of redemption (*rachat*) is at the rate of 10 francs a day for Europeans, and from 1 to 3 francs a day for natives, according to the area in which they are resident. Labour may be utilized on roads, bridges, camps, telegraphs, works of public utility near towns, afforestation, local irrigation, and wells. The tax must not be levied during the harvest season, and schemes for the manner in which labour is to be used must be prepared annually and sanctioned by the *Commissaire de la République*. The taxpayer must be notified in advance of the task on which he will be engaged, and on its completion a receipt must be given to him. Disputes on any question relating to the tax are settled by the ordinary courts; chiefs may be given 10 per cent. of the collections of tax redemption by natives. Non-compliance by natives is punishable under the *code de l'indigénat*. The term of work in force in 1937 was two days in urban and four in rural areas.

In Togo the total of the *rachat* amounted in 1935 to 13,260

francs for Europeans and for natives 2,300,000 francs, as against a total native tax of 2,900,000 francs. In the French Cameroons the total *rachat* in 1935 was 565,000 francs as against a total native tax of 24,942,000 francs; and the labour was stated as 3,269,715 man-days, utilized as to 49 per cent. on roads, 11 per cent. on public buildings, 11 per cent. on their upkeep, 14·5 per cent. on health services, and 14·5 per cent. for 'miscellaneous purposes'. In French West Africa the *rachat* amounted in 1933 to over 5,000,000 francs. The amounts of *rachat* in each case vary year by year in relation to the state of prices; thus in Senegal it amounted to 834,000 francs in 1930, and to 240,000 francs in 1932. The terms of the regulations in force in other territories vary considerably from those in Togoland. The maximum period of labour throughout French West Africa varies from 3 to 9 days; in French Equatorial Africa it was fixed by an *arrêté* of December 28, 1936, at 12. In French West Africa *prestation* labour is everywhere redeemable, but in French Equatorial Africa redemption is restricted to certain groups.

Viewed as a tax, the *prestation* is supplementary to the direct native tax, and its burden must be judged in relation to the total incidence of taxation. Viewed as a method of obtaining labour for public purposes, it has incurred considerable criticism. The French have not been the only government to make use of it. The German Government had imposed a tax in the form of labour in Togoland and the Cameroons, the period being twelve days in the former and thirty in the latter; in both cases it was open to redemption. In the early days of the Congo Free State a *prestation* was introduced for the benefit of the state and of concessionaires; as shown elsewhere, its abolition was among the first of the reforms which followed the annexation of the Congo. The system now in force in the French colonies had, as has been shown, its origin in the law of France itself. The criticism against its use in Africa turns partly on considerations of principle, partly on the ground that it admits of abuse in practice.

On the question of principle, the use of compulsory labour for purely government purposes has, in the view of its critics, given the *prestation* the character of a *corvée* in which the native can see no benefit to himself; they point, in particular, to its use in constructing

main roads or aerodromes, and at one period there were French administrators who suggested the advisability of restricting its use to purely native purposes.¹ In regard to practice, it is clear that there has in some areas been considerable laxity in observing the rule restricting the period of employment, all the more because the construction of the road system has, in the French colonies, been left mainly to the administrative staff, with a financial provision seldom fully adequate to the work expected of it. Women and even children have been required to work, presumably instead of their men relatives.² Again, the system is clearly liable to abuse by the chiefs who prepare the *prestation* lists. These remarks apply in particular to areas in which the observance of the *prestation* regulations is not carefully controlled; where supervision is adequate, as in French Togo and the Cameroons and the more advanced parts of French West Africa, the system is less open to objection. The question whether the system of *prestation* could be considered as compatible with the terms of the mandate has been discussed by the Temporary Slavery Commission³ and the Permanent Mandates Commission,⁴ but these discussions have reached no definite conclusion, as it has been found difficult to discriminate clearly between forced labour as prohibited in the mandate, and forced labour as part of a system of taxation.

In the past the French government has maintained that the system is traditional in Africa and appropriate for the earlier stages of economic development.⁵ An administrative inquiry has, however, been undertaken, with the object of replacing the system in French West Africa, and possibly later in French Equatorial Africa, by a money tax which will enable the work formerly done with *prestation* labour to be performed by paid voluntary labour, and the Governor-General, M. de Coppet, announced in a speech in November 1937 that an experiment would be made in 1938 on these lines in some thirty districts.⁶

⁶ *Discours du Gouverneur-Général*, 1937, op. cit., p. 13.

(f) *Military Conscripted Labour*

Labour conscripted under military regulations was at one time in use in the Belgian Congo, but military 'requisitions' are now confined to securing labour for moving, housing, or feeding the military forces. The system now seems to be a feature peculiar to the French colonies. The use of 'military' labour may be traced back to the period when the French looked to their colonies to provide a reserve of man-power for their military forces. The use of African natives in the army was an active political issue in 1908; the budget of 1910 adopted Ponty's formula of 20,000 *tirailleurs* in four years; and the demand grew until in 1922 the Army Commission foresaw the possibility of a draft of 60,000 men a year from West Africa. The two Governors-General of the time, M. Van Vollenhoven and M. Merlin, pointed out that this would involve a continuous withdrawal of 180,000 men, and in view of the shortage of men for internal development such a utilization of man-power would have the effect of economic self-annihilation. The demand was accordingly reduced, but recent events have suggested that measures should be devised for raising the number of African recruits, and preliminary consultations to this end have already taken place.¹ Under the present system, conscripts who are selected after medical examination as fit for service are divided by the *tirage au sort* into two categories: the first serves with the colours for three years (the *service actif*); the second, or *deuxième portion*, is again divided into two parts, the *travailleurs effectifs* and the *travailleurs libres*. The former are employed on a special class of public works, such as railways, irrigation schemes, and military and other buildings; they remain under military discipline and have much the same conditions as to food and housing as soldiers with the colours, being paid 75 centimes a day. The second class constitutes a reserve which may be called up if required. At one time 10,000 men were engaged; there were in 1934 some 3,600 in French West Africa, mainly on the Niger development works. The system of employing the *deuxième contingent* on major public works was most fully developed in Madagascar, but it is of interest, as

¹ *The Times*, May 18, 1938.

showing the tendency of French colonial labour policy, that the use of military conscripted labour in that territory has recently been abolished.

(g) *Some General Conclusions*

The general movement has been towards a clearer statement of the objects for which forced labour can be utilized, the legal definition of the powers of public authorities, and the more general resort to voluntary labour for major public works. But it has been recognized that, whatever the strength of the arguments against the use of forced labour for public purposes, the logic of facts is in some cases decisive; if, for instance, portage was to be ended, roads must first be constructed, and they could not in every case be made without the use of forced labour. As a French author has put it: 'il est possible que la génération indigène actuelle ait à souffrir de cette contrainte. Mais les générations à venir pourront en être affranchies.'¹ The proceedings leading to the Convention of 1930,² which dealt specifically with forced labour, contain valuable material on the use made of compulsion in the past, and on views held as to the circumstances in which it can be justified. It was generally realized that, apart from any grounds of equity or humanity, labour done under compulsion was uneconomic and had unfortunate social consequences; the discussions, as compared with those of the Convention on Slavery of September 1926, showed a substantial advance of opinion as to the undesirability of using methods of compulsion.

The Convention of 1930 defined forced labour as all work or service which is exacted from any person under the menace of penalty, and for which such person has not offered himself voluntarily. It exempted from this definition labour impressed in cases of emergency, and labour for minor services in the direct interest of the community, also compulsory military service and service exacted from persons as a consequence of a conviction in court, provided that they are not hired to work for private persons or companies. The provisions of the convention with regard to labour for chiefs have already been mentioned. Further provisions re-

¹ P. Dareste, *op. cit.*, p. 536.

² International Labour Office, *Report on Forced Labour*, 1929.

quire that forced labour for the transport of persons or goods, while tolerated for the time being in the case of government or urgent needs, shall be abolished within the shortest possible period, and that recourse to compulsory cultivation as a precaution against famine shall only take place when the produce remains the property of the community producing it; it would, however, allow work demanded by law or custom where production is organized on a communal basis and the produce or profit accrues to the community. Of the states governing territories in Africa, France, Great Britain, Italy, Liberia, and Spain have ratified the convention, and a Bill for ratification is before the Belgian Parliament. The French ratification and the proposed Belgian accession make reservations on certain points, the most important of which relates to the article of this convention restricting the use of compulsory cultivation to cases of famine, as both countries attach importance to compulsory cultivation as a method of educating natives in the production of economic crops.¹

It would be difficult, and it would also be unsafe, to generalize as to the extent to which the restrictions placed by legislation on the use of forced labour for public purposes are observed in practice. Here, as elsewhere, the spirit of the administration, and the traditions of its personnel, count for much. There is, it may be said, a difference observable between the degree of supervision exercised over the use of this type of labour in the mandated areas and that seen in some of the other African territories. It is of some importance to note that observations conducted during a period of depression of prices, when public works are curtailed and voluntary labour is freely forthcoming, are apt to leave a different impression from that formed at a period of higher prices and of administrative activity. Portage now constitutes the most conspicuous form of demand for forced labour. It has been abolished in Gambia and the Gold Coast and restricted by law in the Belgian Congo² and in Tanganyika;³ in nearly every territory the administration is able to count on the progressive effect of the development of motor communications in reducing the need for

¹ See pp. 630-5.

³ Tanganyika Ordinance 18 of 1928.

² See p. 621.

portage.¹ Though some abuses of authority still exist, there is a consistent movement in all territories towards a more efficient regulation of the use made of forced labour, and the substitution of voluntary labour.

III. COMPULSION FOR THE STIMULATION OF NATIVE AGRICULTURAL PRODUCTION

The use of compulsion as a means of stimulating agricultural production has been represented as having an analogy with the customary exaction of services for securing the common subsistence of the community. In truth, the connexion is at the best slender; in its present form the practice reflects the views of modern administrations as to the extent to which some sections of the African people, who have not come under the influence of the economic incentive, may need to be subjected in their own interest to a stimulus of another character. The view that constraint of this nature is justifiable was implicit in Lord Milner's dispatch of 1920, to which reference has already been made;² but it finds its clearest expression in the proceedings of the Conference of Governors of the East African dependencies in 1926.³ 'Steady progress', they said, 'cannot be secured in some areas unless every able-bodied native who shows no tendency to work is given to understand that the Government expects him to do a reasonable amount of work either in production in his own reserves or in labour for wages outside it.' The imposition of *travail public obligatoire*⁴ has been viewed in France more simply as a reminder to the native of the duty which he, as well as the European, owes to society; and much the same spirit inspires the instructions issued by the Belgian Colonial Ministry on September 28, 1934: 'Le peuple colonisateur manquerait à son devoir si, sous le prétexte, du reste fallacieux, de respecter la liberté de l'indigène, il reconnaissait aux noirs . . . le droit de vivre ou plutôt de végéter dans la paresse.'⁵

Mankind at large seldom interests itself in the principles underlying a law until it finds its application irksome, and to the African

¹ See Chap. XXIII, p. 1539.

³ *Summary of Proceedings*, pp. 13-17.

⁴ See above, p. 622.

⁵ *Annuaire de documentation coloniale comparée*, 1934, vol. i, p. 179.

native the operation of the regulations for increasing production is doubtless of more interest than the principles on which they are held to be justified. There is a marked difference in the policy adopted under different colonial systems. Where definite powers have been taken in the British colonies, they are confined to the use of compulsion for the planting of food crops as a precaution against scarcity. Some reference has already been made to these regulations; typical cases are those of the Northern Rhodesia Ordinance 9 of 1936, which allows of compulsion for the planting of food if famine threatens, the similar clause in the Native Authority Ordinance of 1926 in Tanganyika, and the Native Authority Ordinance of 1919 in Uganda. When no definite powers are taken, the general provisions of the ordinances regarding the use of 'communal' labour for the benefit of the community have been available. Considerable use has been made of these provisions during the periods marked by drought conditions; and they have also been resorted to in cases where, as in some parts of Tanganyika, the expansion in the growth of marketable crops has seemed to be leading to a dangerous reduction in subsistence crops. It is probable, however, that there has seldom been any necessity to resort to legal compulsion; the influence of the administration must in most cases have enabled it to secure compliance with orders clearly directed solely to the protection of the community itself.

The British colonies have not taken legal powers to stimulate the production of marketable crops. That stimulus has been applied is not open to question; the expansion of the cotton and coffee production in East Africa was not at the outset left entirely to the influence of the economic incentive. The 'moral pressure' applied to the cultivation of cotton in Uganda and Nyasaland has been officially recognized.¹ The Governor of Tanganyika in his circular of August 25, 1925, defined the policy as follows: 'As soon as it is shown to the satisfaction of the administrative officer that a body of natives desires to grow economic crops for sale or export, he should assist them in every way to do so. If he finds,

¹ *Report of the East African Commission*, Cmd. 2387, 1925, p. 34; *Report on the Formation of a Native Agricultural Board*, Sessional Paper 1, 1930. See also *Report of Committee on the Supply and Welfare of Native Labour in the Tanganyika Territory*, 1938, p. 14.

however, that a particular community turns a deaf ear to his exhortation to them to adopt some active form of work, it will be his duty to use every legitimate means at his command to induce them to take up the cultivation of economic crops.' In certain conditions there can be little difference between the giving of advice and the issue of an order; there is, however, a substantial distinction between a general direction to increase production, and the issue of an order prescribing a definite task, supported by a threat of penal sanctions. Whether a more direct use of the latter method would have been of general advantage is a question of policy which need not be examined here; it is enough to say that it is not a policy which has been pursued in the British African colonies.

Passing to the French territories, it is not now necessary to dwell on the earlier history of French Equatorial Africa, which presented many features similar to that of the Congo Free State, in that compulsion, supported by legal sanctions, but also dependent largely on the use of extra-legal methods, was one of the most mischievous features of the 'concessionnaire' system. Compulsion was, however, in this case directed to the collection of forest produce rather than to the extension of cultivation; where, like M. Lamblin in Ubangi-Shari, authorities used compulsion to extend the planting of rubber by natives, it was largely in order to provide a means which, while allowing the native to satisfy the state tax, would take him out of the range of the compulsion exercised by 'concessionnaires' for their own profit.¹ The régime was specially characteristic of French Equatorial Africa; the history of French West Africa was marked by few incidents of this nature. A local circular of April 21, 1912, which made obligatory the growing of cotton, was of a different character. The more modern policy of the French colonies is that embodied in the general decree of August 21, 1930, which confines the use of 'obligatory' labour to provision against scarcity or *pour des fins d'enseignement agricole expérimental*, the latter provision being clearly designed to apply to the growing of marketable crops. There appears to be little resort to the use of penal sanctions in carrying out this policy, but that the recent increase of coffee in the

¹ A. Gide, *Voyage au Congo*, 1927, p. 79.

Cameroons, and cotton in French Equatorial Africa, is due in considerable part to official stimulation must be clear to every observer, though there may be the same difficulty, as in the British colonies, in drawing the line between persuasion and compulsion. In the French areas there has of late years been in force a definite scheme of development in pursuance of the policy of *mise en valeur* described elsewhere;¹ and the interest of the administration of French Equatorial Africa in the local development of marketable crops is evidenced by the regular attendance of the *garde de cercle* when the ground is being prepared. The large extension of ground-nut cultivation in French West Africa is, on the other hand, due rather to the activity of the *Sociétés de Prévoyance*, and the influence of the economic incentive, than to direct pressure from the administration.²

The Belgian Congo has made a marked use of the practice of compulsory cultivation. The home government formally sanctioned the use of the system in 1917, the produce being bought directly by government and either exported or sent to the industrial area of Katanga.³ The method was justified as providing the only answer to the problem which the Colonial Minister expressed in the words 'comment développer l'agriculture sans cultivateurs actifs?' The system finds a place in a statute of the territory,⁴ which lays on the *circonscriptions indigènes* the obligation to maintain sufficient subsistence crops, and also 'des cultures de vivres ou de produits d'exportation imposées à titre éducatif'. Such cultivation must, however, be in the exclusive interest of the population, and the power of sale must be unrestricted. When this decree was considered by the *Conseil Colonial* in 1933 it produced an interesting discussion as to the period up to which compulsory cultivation⁵ for marketable crops could properly be regarded as 'educative'. There could obviously be no definite line of demarcation, but it was concluded that every effort should be made to work for the cessation of compulsion by demonstrating to the native the value to him of improved cultivation. In practice the rules lay down for each district a prescribed number of acres of

¹ See Chap. V, pp. 139-40.

⁴ Decree of Dec. 5, 1933.

⁵ J. Magotte, *Les circonscriptions indigènes*, 1934, p. 126.

subsistence crops, and observation shows that much use is made of these rules both in the Congo and Ruanda-Urundi.¹ Obligatory cultivation of marketable crops has been utilized mainly for the extension of cotton and to a lesser extent of coffee. There is no doubt that direct compulsion has been widely used, and there have been in some districts many convictions in recent years for non-compliance with the obligation to grow cotton. This type of labour is included among those covered by the decree regulating the use of compulsion,² which limits the obligation to sixty days, but in the case of agricultural work such a limit is clearly difficult to apply. Observation of the cotton cultivation shows that in some areas, where in the first instance it was grown 'collectively' under the direction of chiefs, individuals now come forward readily to take seed. The administration has arranged that the cotton companies shall pay a fixed price for cotton, and interest has been stimulated by allowing a portion of the price paid to be given to the *caisse de chefferie* for road repairs and the like. The sale cannot be said to be free, as each company has a monopoly for the purchase of cotton within its zone of operations, but it would seem probable that, if compulsion were withdrawn, a considerable proportion of the area now under the crop would continue to be cultivated.

The merits of the application of compulsion as a stimulus to native cultivation are not easy to assess on grounds of principle. It offends against the sentiment of individual liberty; but modern Europe is increasingly prepared to regard the claims of individual liberty as being strictly relative to the social needs of the community at large. The obligatory growth of marketable crops is, however, in practice liable to two objections. The extent of the market available may be miscalculated; that has happened on more than one occasion and has created an embarrassing situation for the local administration. In the Belgian Congo the government has endeavoured to meet this danger by fixing the price of cotton at a figure which can be maintained over a course of years in spite of market fluctuations; but that procedure can only be followed

¹ For a detailed description of the rules in the Equatorial Province see M. Mottoulle, *Le problème de la main d'œuvre au Congo belge*, 1931, pp. 92 ff.

² See above, p. 633.

if the state has a definite control over the operations of marketing companies, and it necessarily involves that the price given is often below the current market value. It has been stated that in Uganda the natives believe that government fixes the price of cotton, and when it is low that they are being deliberately oppressed.¹ The other objection is perhaps the more serious of the two. The native is still only a producer; the marketing of an exportable crop must in present circumstances rest with non-natives, and unless the administration is conducted in a spirit of sufficient detachment there will always be some danger that compulsory production may be made to serve private commercial interests. The close connexion established with the cotton companies provoked criticism of the Congo system in the Belgian Chamber at the session of July 14 and 21, 1932. The Portuguese system, which allows officials to hold a share in private enterprise in the colony, inevitably lays the use of 'educative compulsion' open to suspicion, and critics have remarked on the fact that Belgian officials in the past have on retirement frequently accepted posts on the directorate of companies operating in the Congo. Where, however, the procedure of compulsory cultivation can be adequately safeguarded, the system is not without advantage as a preliminary to the establishment of the normal economic incentive.

IV. LABOUR IN PRIVATE EMPLOYMENT: EVOLUTION OF THE PRESENT POSITION

(a) *The Historical Background*

If in Africa there is now little use of direct pressure by government in order to secure labour for private employment, this was a marked feature of policy in the past, and discussion of the methods used has been a prominent topic in colonial literature.² The use of pressure has not been universal, and it has been most marked in

¹ L. P. Mair, *An African People in the Twentieth Century*, 1934, p. 151. See also I. C. Greaves, *Modern Production Among Backward Peoples*, 1935, p. 199.

² For a comprehensive study of the question of industrial and urban labour in South Africa, see Dr. Charlotte Leubuscher, *Der südafrikanische Eingeborene als Industriearbeiter und als Stadtbewohner*, 1931.

territories in which European colonization, or the rapid extension of mining, has created a demand which the offer of wages could not supply. A complete history of this aspect of labour development would comprise the use of means so various as slavery, direct statutory compulsion, pressure through the imposition of personal tax, the curtailment of native lands, assistance given by administrative officials to the efforts of private recruiters, and the use of chiefs to recruit their people as labourers. For the present purpose, however, it is sufficient to give only so much history as will describe the background from which existing conditions have evolved. If it is necessary to include in the review some mention of slavery, it is because it had an influence both on the attitude of the native towards wage-earning and on the early policy of colonists in obtaining labour. In those parts of Africa where domestic slavery was a recognized institution, the native's first experience of working regularly for others was in the form of slavery, and it carried with it the demoralization which usually characterizes the use of forced labour; the heritage of slavery is irresponsibility and lack of forethought.

(b) *South Africa*

In South Africa the traffic in slaves was abolished with the Act of 1807; but its influence continued to be felt in the relations of white colonists and native labour. Theal, the South African historian, has observed that it was largely the system of Negro slavery which caused early colonists to regard the native as the hewer of wood and drawer of water.¹ Africa was not the only heir to the legacy left by slavery; almost every country which came into contact with the slave trade felt some of its influence, though it has been observed that this was generally less marked in Latin countries than in others. Historians of the Industrial Revolution in England have remarked that the influence of the slave trade was seen in the spirit in which the new industrialists of North and Midland England approached the treatment of labour in their mines and cotton mills. The employment of Poor Law apprentices in the English factories had many points in common with the

¹ For a somewhat different view see J. F. W. Grosskopf, *Report of the Carnegie Commission on the Poor White Problem in South Africa*, 1932, part I, p. 170.

system of apprenticeship under which Hottentot and Kaffir adults and children were secured by Boers in large numbers for farm labour, or with the early use of the Masters and Servants Acts in the Union. Some observers have considered that 1717 was a crucial date in South African history, for it was then that the Dutch Company rejected the advice of Dominique de Chavonnes to rid the colony of slaves and establish an economy based solely on white labour.¹ The decision was momentous, though the lines which the development of the Cape might have taken, had the advice of de Chavonnes been accepted, are a matter of conjecture. There has, perhaps, been in some quarters a disposition to exaggerate the influence of slavery on the later developments of South African policy towards the native; but it can justly be held to have made some contribution to the tradition which the report of the Transvaal Indigency Commission of 1906-8 described as the 'pernicious theory that the line between white man's and black man's work should coincide with the line between skilled and unskilled labour'. Further, if slavery has contributed to produce the longstanding prejudice against manual labour, branded from early times as 'Kaffir work', it has had some share in accentuating the problem of the poor whites in the Union, which to-day is the focus of many of its economic and social questions.²

The earlier use of apprenticeship and similar laws in the Union was directed to securing labour on the farms; and the supply of farm labour was the issue on which discussions regarding the merits of the reserve policy mainly turned.³ With the discovery of the diamond- and gold-fields fresh demands arose; the wages offered were on a more liberal scale than the farmer could afford, but from the first failed to attract a sufficient supply of local labour. There is evidence that pressure was exercised through the chiefs in Zululand, Bechuanaland, and Basutoland to secure recruits; and it is clear that the existence of the native poll tax was a powerful influence in stimulating recruitment. Though it does not appear in the first instance to have been imposed only with this object in view, there were cases in which its incidence was

¹ E. A. Walker, *A History of South Africa*, 1928, p. 79.

² See below, pp. 684-7.

³ See Chap. XII, pp. 803 ff.

raised with the definite purpose of securing labour; thus Natal in 1857 raised the hut tax from 7s. to 11s. a year on natives who were not working for Europeans. It is also true that the need for its maintenance in the interests of recruiting was an effective argument against its reduction, and ensured an extreme rigidity in its collection. The European trader, who held the monopoly of trading licences in the reserves, became in his turn an effective auxiliary in the work of recruitment.

The endeavour to secure local Union labour for the mines was one of the dominant factors in the policy underlying the Glen Grey Act of 1894. By substituting a system of individual tenure for the collective system of the reserves, Rhodes hoped, in his own words, to supply to the 'surplus population a 'gentle stimulant to go forth and find out something of the dignity of labour'.¹ Any native not in possession of land under the new system was to pay a tax of 10s. a year unless he could prove that he had been in employment three months out of twelve beyond the borders of the district. In 1903, however, the committee which considered the working of the Glen Grey Act found the labour clause prejudicial to the extension of its land clauses, and it was repealed in 1905. No further efforts were made to secure labour by direct pressure of this nature, and the Union turned its attention to the possibility of augmenting its labour supply by external recruitment. Natal, where the shortage of labour in the sugar fields constituted a special case, had resorted as far back as 1860 to the use of indentured Indian labour;² in 1896 the Portuguese Government authorized recruiting for the gold mines, and an agreement of 1901 between the two governments regularized the organization of the recruiting agencies. The acute labour crisis in the mines after the South African War led in 1903 to the short-lived experiment of the importation of Chinese labour; increased importance was attached to recruiting from Portuguese areas, and beginning with 1909 a series of conventions on the subject was concluded with the Portuguese Government.³ Though, of course, the Union cannot be held directly responsible for the fact, it is

¹ Quoted by L. C. A. and C. M. Knowles, *The Economic Development of the British Overseas Empire*, vol. iii, 1936, p. 321.

² See Chap. VIII, p. 319.

³ See below, pp. 652-3.

generally agreed that recruitment in Portuguese areas has involved some element of compulsion, though its exact degree is not easy to determine. Reference has already been made on page 623 to the use made of the decree of October 14, 1914, which authorized the government to place natives, not otherwise employed, at the disposal of colonists or merchants; as will be shown on page 650, below, this law is not now in force. It has at the same time been suggested that, owing to the conditions then prevailing in Portuguese territory, natives readily accepted service in the Transvaal mines; it is certainly the fact that there was, after the War, a marked exodus from the Portuguese territory into Tanganyika and Nyasaland. Figures will be given¹ showing the total extent to which the Union now relies on external recruitment; so far as local recruitment is concerned, it now depends on ordinary economic inducements, reinforced by the influence of the direct native tax and the inadequacy of the lands reserved for native occupation.

(c) *British Colonial Dependencies*

In the British colonial territories there has been less disposition to assist recruitment by the adoption of methods outside the normal incentive of wages. But the poll-tax has also been a contributing, and in some circumstances almost a determining, factor in that incentive; there are few studies dealing with the effect of labour developments on native social life which do not call attention to its influence. In stating that taxation is a major cause of labour emigration the Nyasaland Committee on Labour Emigration of 1935² confirms an experience of which there have been numerous proofs elsewhere. At the same time it remains true that the tax has not in the British colonies been imposed with the deliberate intention of stimulating a supply of labour: official opinion has always expressed itself as opposed to the policy of utilizing the tax as a direct means of assisting recruitment. The Kenya Labour Commission of 1912-13³ held that 'taxation is unjustifiable as a means of increasing the labour supply'; and the same view was taken later by the Governor of Tanganyika:⁴ 'coercion of labour

¹ See below, p. 652.

⁴ Colonial 19, 1926, p. 10.

by pressure of direct taxation is little, if anything, removed from coercion of labour by force'.

Where labour policy has in the past been a prominent issue, it is mainly in connexion with the demands made by employers for official aid in recruitment. These demands have arisen in the most marked form in Southern Rhodesia and Kenya. Whatever the truth of the allegation that officers of the Chartered Company used undue pressure to secure labour for the mines in Southern Rhodesia, the Secretary of State deemed it advisable in 1901 to forbid the use of direct or indirect pressure, though in 1907 he varied his instruction so far as to allow officers to 'advise' natives to go to work. A Native Affairs Committee of 1910-11 was opposed to allowing officials to show any interest in recruitment: as they said, 'advice' which was rejected would bring a loss of prestige which could only be cured by resort to compulsion, and this view was officially endorsed by the Governor in 1925. In Kenya the question attracted almost continuous notice between 1907 and 1928. The 1907 Labour Rules, which laid down that officers should do their best to supply labourers for settlers and planters, so long as they treated their labour properly, were resented by settlers, who demanded that officers should be explicitly required to 'encourage' natives to seek labour, and to do their utmost to assist those settlers who needed it. The Secretary of State in 1909 thought it necessary to issue instructions that officers were not to recruit labour for farmers; and in 1912 a commission was appointed to investigate the problems of labour supply. There was evidence that in some cases chiefs had forced natives to go and work; and there was clearly considerable diversity of practice observed by officials themselves in regard to assistance to recruitment.¹ The settlers on their part stigmatized the attitude of the officials as one of an unhelpful neutrality, and a section pressed the commission to recommend an increase in native taxes in order to augment the supply. Pressure from the settlers increased during the War; in 1917 the Governor agreed that natives should be induced 'by humane and properly regulated pressure within the reserves' to go out and work for Europeans.² The instruc-

¹ *Native Labour Commission Report*, 1912-13, paras. 68, 83.

² *Proceedings of the Legislative Council*, 1917, p. 3.

tions known by the name of the Northey circulars, issued in 1919, directed officers to exercise 'every possible lawful influence' to secure labour for settlers, and placed an obligation on chiefs and elders to render them the necessary assistance.

The feeling aroused in England by these orders was one of the causes leading to the issue of Lord Milner's dispatch of 1920, already referred to in this chapter.¹ It endorsed the policy of the Northey instructions in so far as to lay down that encouragement and advice should be given to chiefs and headmen, though no force or compulsion should be exercised. The pressure in home circles, however, was strong enough to cause the Colonial Office in the following year to vary the note of its instructions; the orders of 1921 approved of 'inculcating habits of industry both inside and outside the Reserves', but directed officers to limit themselves to giving information as to where labour might be required, and to take no further part in recruiting.² These instructions neither gave to the settler the help for which he asked, nor to the officials the clear guidance they were entitled to receive. The demand for labour continued to be acute, the farmers' associations continued to inveigh against the policy of 'neutrality' indicated by government, while local officers continued to apply to the instructions of the British Government that variety of interpretation which their vagueness almost seemed to encourage. In 1925, indeed, the Governor placed on them a construction which can with difficulty be held to have come within their intention, for he emphasized the need for giving all possible encouragement to natives to work for settlers.

The 1926 Conference of Governors of East Africa³ expressed the opinion that where productive labour in the reserves was not possible, the native should be definitely encouraged to go out and labour. 'Where both alternatives are open to him, the Government is not concerned to impose either upon him, but simply to ensure, so far as it can, that he shall work in the cultivation of his own land, if he pleases, or else as a wage-earner on alienated land if he prefers it.' At a later date the Commission on Closer Union in East and Central Africa⁴ pointed out that government

¹ See above, p. 616.

² *Dispatch Relating to Native Labour*, Cmd. 1509, 1921.

³ See above, p. 630.

⁴ *Report*, Cmd. 3234, 1929, pp. 63-72.

had a double obligation; it had to keep a fair field open for would-be employers and at the same time to protect the native from exploitation. The Commission did not doubt the benefit which the existence of non-native enterprises offered to the native, and it considered that the employment of the native in them might justifiably be encouraged so long as it was voluntary and did not operate in such a manner as to prevent the proper development of native society. It is important to note here that the Commission suggested that in order to safeguard the last condition a general survey of labour conditions should be made, and commended the lines of that undertaken by the Congo Government.¹

Some prominence has been given to these incidents, for they illustrate the difficulties attending the position of government in a period of transition towards a system of purely voluntary labour in private employment. The difficulties of the settlers were real; colonization had been encouraged by government, and the development of farms of the type allotted was impossible without hired labour. Only the most extreme section of settlers envisaged anything like compulsory recruitment; the issue was really one of the use of some degree of official pressure. Local officials were far from lacking in sympathy with the native position, but there were those of them who were in favour of the use of some form of pressure, in the genuine belief that no advancement was possible unless the native accustomed himself to regular labour. A problem similar in character, if not in degree, presented itself in Tanganyika owing to the rapid development of sisal and other plantations after the War, but here the attitude of government was at the outset more definitely on the side of neutrality. In 1926, however, following the proceedings of the Conference of Governors in East Africa, the Tanganyika Government issued a circular of August 5, 1926, which indicated the need for encouraging the native to work on farms in areas where his own production was insufficient.

In Nigeria a supply of labour at the government coal mines at Enugu was at one time obtained through the chiefs, but the difficulty was only of a temporary nature. The shortage of labour for the mines on the Gold Coast began to take an acute form about

¹ See below, p. 645. [The projected survey has not been made.]

1910, and the companies asked for any support which government could give, short of compulsion, in order to secure labour. Some local recruitment was at one time made through the Transport Department, and political officers in the Northern Territories gave some assistance in securing recruits from their area, but the high mortality among natives so imported led to the issue of an order by the Secretary of State in 1924 forbidding the grant of further assistance.¹ The problem, however, never assumed the same proportions or attained the same publicity as in East Africa.

(d) *The French Colonies*

In dealing with the French colonies a distinction must be drawn between French West and French Equatorial Africa. In the former, the absence of a large colonizing or mining interest made the question of labour supply one of local rather than general importance. Up to about 1928 the administration undoubtedly provided labour for some of the trading and agricultural enterprises, such as the *Compagnie des Mines de la Faléme* and the *Compagnie des Cultures tropicales*, while the *Compagnie de Culture cotonnière* at Diré in the Sudan received considerable assistance from local chiefs, who controlled a population only recently rescued from serfdom.² It has been officially admitted that assistance was given to forestry undertakings on the Ivory Coast in order to secure labour.³ In 1920 the local chambers of commerce made an unsuccessful attempt to secure the enrolment of a conscript 'labour army', but though the government now avails itself of the *deuxième portion* of its military conscripts for its own works,⁴ the use of labour from this source has been refused to private enterprise. In the Upper Volta the administration denied any assistance to employers, owing to the demands previously made for forced labour for the railways,⁵ but elsewhere it showed itself, on the whole, prepared to exercise influence on their behalf.

In French Equatorial Africa the method of exploitation known by the name of *cueillette*, which aimed at securing rubber, ivory, or

¹ *House of Commons Debates*, June 23, 1924, vol. clxxv, c. 8.

² F. Béline, *La Production du coton en A.O.F.*, 1925.

⁴ See above, p. 627.

⁵ *Ibid.*, p. 614.

the like by native collection, gave the concessionnaire authority to exercise 'tous les droits de jouissance et d'exploitation',¹ and established conditions such that in the rubber producing areas at least the native may justly be said to have been subjected to general servitude. The legislation of 1895² effected changes which practically brought that system to an end; but even at a later date, the government formally recognized its obligations to assist private employers. A circular of October 10, 1911, emphasized the duty 'to provide for our fellow countrymen, who have come to take part in the work of colonization, a first guarantee for the continuation of that work by aiding them to obtain the necessary hands for the maintenance of their undertakings'.

The impetus given to the development of the French colonies after the War increased the demand for native labour, and, as a result, it was considered necessary to adopt safeguards on its behalf. A series of circulars relating to the protection of the health of native workers was issued in 1924, applicable to all French colonies,³ and local instructions issued in March, 1926, laid down that the first call upon the native labour supply must be for the provision of subsistence and marketable crops; military conscription has the second call, and only after these needs have been supplied can other demands be met. When in 1930 the Chamber of Deputies adopted a Bill providing for large colonial loans, a special point was made of the necessity of preparing a plan for the 'demographic protection' of the communities from which labour, whether voluntary or compulsory, is drawn, and it was considered that where health conditions were poor no recruiting of labour should be authorized.

(e) *The Belgian Congo*

- * The régime of the Congo Free State, like that of French Equatorial Africa, produced conditions in which recruitment for private employ hardly arose as an issue; the native was already in a position of servitude to the concessionnaire. The prevention of the abuses which this situation permitted was one of the first matters to engage the attention of the Belgian Government after annexation,

¹ P. Daresté, op. cit., vol. ii, pp. 321 ff.

² See Chap. XII, p. 783.

³ *Ministerial Circulars*, July, 1924, and Oct. 4, 1924.

and Article 2 of the *Charte Coloniale* laid down that no one could be compelled to work on account of individuals or companies. Labour shortage began to present an acute problem with the development of the copper and gold mines, and early attempts to secure labour from Northern Rhodesia for the Katanga Mines only filled part of the gap. The government maintained an *Office du Travail* at Léopoldville for its administrative labour; local recruitment for private enterprise was from 1910 onwards placed in the hands of agencies in the Katanga and the Kasai under the name of *Bourses du Travail*; and in 1925 the *Union Minière* obtained sanction to extend its recruiting to Ruanda-Urundi. The provisions of the *Charte Coloniale* were not deemed to be inconsistent with the use of official pressure in aid of these recruiting organizations. A circular of 1922 emphasized the duty of officials to give all necessary aid to private enterprise; if moral authority, encouragement, and favours failed, marks of displeasure were to be imposed.¹

Local officers gave an effective compliance to these instructions. While the general object of official assistance may have been to promote the economic development of the country, the fact that the state had so large an interest in most of the industrial enterprises gave the recruiters' indents some of the character of a state demand. The requirements were large; the transfer of recruits over the considerable distances involved was accompanied by a high incidence of disease and mortality; and there were many signs that the system was attended with the most unfortunate results on the family and social life of the native.² The home government had to face criticisms similar to those which followed the issue of the Northey circulars in Kenya,³ though the demands made in Kenya, being only for local farm labour, caused little mischief to native life compared with the demands for industrial labour in the Congo. The government appointed in 1924 a Labour Commission to deal with the problems involved, and in the report issued in 1925 this body made a noteworthy departure in the treatment of the African labour problem by initiating a

¹ *Recueil mensuel*, 1922, p. 7.

² See statement by O. Louwers in *Revue catholique des idées et des faits*, nos. 40-1, Jan. 6, 1934.

³ See above, pp. 640-1.

survey of the limits within which recruiting could be regarded as permissible.¹ As a basic rule, it considered that a maximum of 5 per cent. of able-bodied male labour could be taken from any community for work at a distance; a further 5 per cent. could be taken for work within a two days' radius of the village; and a further 15 per cent. could be employed in the vicinity of their homes in the production of foodstuffs or short portorage or other activities on behalf of employers. The report seemed to imply that government would assist in the recruiting of labour up to these figures. Local orders of 1925 gave effect to the recommendations of the commission regarding the permissible percentage of labour to be taken, and certain districts were definitely closed to recruiters for a series of years. Protests, however, continued to be made in Belgium against the grant of official aid to recruiters, and late in 1925 the Colonial Minister, admitting that administrative officers had in some cases undertaken a role normally belonging to agents of private enterprises, required officials to abstain from direct assistance to recruitment.

At this point the Belgian Ministry began to find, as the British Colonial Office had already found, that it was not easy to steer a course between the pressure of humanitarian influences and the demands of employers who had become dependent on state assistance. As a result of the difficulties experienced in carrying out the recommendation of the 1925 report on the subject of the limitation of recruiting, a permanent Advisory Committee on labour questions was appointed in 1928. This body realized that the problem was not merely one of labour supply, but was related to the whole course of economic development. It delimited economic zones, in certain of which not only recruiting, but further concessions for industrial or agricultural purposes were to be prohibited, while in others a survey was to be made, with the help of employers and missionaries, in order to determine a local policy of development. It stressed the danger of official intervention in recruiting; 'cette situation provoque un malaise auquel on ne pourrait mettre fin qu'en déchargeant explicitement les agents de l'autorité de toute responsabilité dans la situation de main-d'œuvre des entreprises européennes.'

¹ *Rapport de la commission pour l'étude du problème de la main-d'œuvre au Congo belge, 1924-5.*

The examination of the labour situation continued to form a prominent feature in the annual reports of the Belgian Congo, and the situation was discussed in an important speech delivered in the Chamber on February 21, 1929, by the Colonial Minister, M. Jaspar. There was a movement on the part of the Catholic missions to protest against the excessive recruiting of native workers, and in 1930 another Labour Commission was appointed to study the question of recruiting on the spot, in collaboration with the 'Native Protection Commission', which exists in the Congo.¹ On its return the Labour Commission made two important recommendations. It pronounced definitely against official intervention on behalf of recruiters; only where backward tribes were concerned was the administration justified in intervening on behalf of satisfactory undertakings, and then only in pursuance of a definite ordinance by a governor of the province. As regards the percentages laid down by the Commission of 1925, the 1930 Commission thought that there was no advantage in maintaining the differentiation of labour into three classes, as no distinction could be drawn between employment at two days' distance and farther afield, but they still considered that not more than 10 per cent. of able-bodied males should be allowed to leave the village. It must be realized that the labour situation in the Congo changed somewhat rapidly from 1930 onwards owing to the economic depression; during 1931 no fewer than 72,000 workers were discharged, and, taking the Katanga as an example, it would seem that by 1933 the number of native wage-earners had fallen in relation to the year 1929 by 50 per cent. for the Katanga area and by 70 per cent. for the industrial region of Upper Katanga. Meanwhile, certain modifications in government policy took place; state officials were no longer allowed to enter the service of private companies, and district officers were prohibited from accompanying recruiters on their tours. The administration had, at an earlier stage, allowed the native authorities to assist recruiters,² but there were observers who pointed out that this system led, in practice, to recruiting becoming one of the principal functions of the chief. It was, indeed, stated that, owing to requisitions by chiefs, large

¹ See Chap. VI, p. 208.

² *Rapport du comité consultatif de la main-d'œuvre*, 1928, pp. 47-8.

numbers of natives had passed *en masse* into Uganda.¹ A decree of December 5, 1933, required the gifts and grants made to native chiefs for recruiting to be paid into the *caisses de chefferies*. The bonus paid for each recruit varies from 70 to 125 francs in the Upper Katanga and from 20 to 35 francs in other regions.

(f) *The Present Attitude of Administrations*

As will have been seen from this study of past conditions, policy has moved progressively away from reliance on methods of pressure, either direct or indirect, towards dependence on the normal economic stimulus. To this movement various factors have contributed. International influences have been represented in the general acceptance of the conclusion of the Temporary Slavery Commission of the League of 1925 that indirect or 'moral' pressure, if exercised by officials to secure labour for private employment, may in effect be tantamount to compulsion, and by the acceptance of the terms of the Geneva Convention of 1930 on Forced Labour. Certain administrations have been impressed by the effect on their own populations of a large emigration due to recruitment for work in other territories, a matter to which the report of the 1935 Committee on Emigrant Labour in Nyasaland has recently directed general attention. Perhaps the most effective factor has been the operation of economic incentives, which some observers now regard as not less important than the influence of the native tax upon the labour supply. They have noted that in certain areas 'the shopkeeper probably provides a far greater incentive than the taxgatherer',² and that taxation, which originally drove natives to work, 'has increased their relative preference for what they can get with money over leisure and the products of tribal communism'.³ Young men are bored by the limitations of village life and seek work to satisfy their desire for adventure and independence, also to earn sufficient wealth to pay dowry for wives or clothe themselves and their families.⁴ Even among more

⁴ F. Spearpoint, 'The African and the Rhodesian Copper Mines', *Supplement to the Journal of the Royal African Society*, vol. xxxvi, July, 1937.

prosperous agricultural communities the more adventurous youths will leave home and engage in work if fair treatment and wages are available.¹ The play of the various incentives must clearly vary in different areas, but it is true generally that the flow of labour is now far less dependent than formerly on the incidence of taxation. The situation has further been affected by the attempts made to substitute a stabilized industrial population for migratory labour in the Congo, and by the facilities for the accommodation of wives and families in the Rhodesian copperbelt and elsewhere.²

In questions where natives are concerned it is always important to examine the extent to which a policy announced by government is implemented in day-to-day practice. Those who have observed the British colonies in recent years will probably have seen little evidence of any kind of official pressure. Perhaps the best test is the regulations controlling the relations between the recruiter and the chiefs. The South African Native Labour Regulation Act of 1911 provides in section 13 that no concession by a chief or headman for the supply of labour shall be legally binding. In the High Commission areas no contract by which any chief binds himself or his people to render labour is valid, although it would nevertheless appear that in these areas the chiefs, in order to facilitate tax collections and the payment of their own levies, put pressure on their subjects to enter into recruiting contracts.³ In Southern and Northern Rhodesia contracts by native chiefs to provide labour are similarly illegal, and in Kenya and Tanganyika the offer of gifts to native chiefs or headmen with a view to securing labour is punishable with a fine. In some areas, such as Tanganyika, there have recently been complaints of a labour shortage, but a recent committee took the view that there is ample manpower for the needs of the territory; there is a labour wastage among wage-earners, but this could be remedied by making labour conditions more attractive, as well as by the more economical use of the existing supply.⁴ In the French territories also there

⁴ *Report of the Committee appointed to consider and advise on questions relating to the supply and welfare of Native Labour in the Tanganyika Territory*, 1938, p. 11.

are now few signs of official pressure in the interests of private recruitment, but it remains to be seen what attitude will be adopted if the attention now being paid to the increase of mineral production leads to an urgent demand for mine labour.

In the Belgian Congo the fact that the state has a direct interest in the activity of most of the industrial enterprises continues to render it difficult for the local administrator to observe the neutrality indicated by official policy. While the definite exclusion of certain areas from recruitment remains operative, in regard to others intervention in aid of the recruiter, though far less marked than formerly, has seldom been entirely absent. The system under which a bonus for recruiting is paid to the *caisse de chefferie* remains in force. The policy of the home government itself seems to have undergone some change, as the result of the revival of industry after the depression period. The Colonial Minister in his instructions of October 15, 1934, indicated that 'l'administrateur . . . qui engagera de façon pressante l'indigène à travailler pour compte d'un employeur qui assure à son personnel des conditions de travail, un salaire, un ravitaillement, un logement convenables . . . accomplira un devoir de sa charge'.

In the Portuguese areas the payment to chiefs for assistance to recruiters authorized by the decree of November 29, 1922, has been withdrawn. The 1928 Native Labour Code, while providing that every authority exercising jurisdiction over natives should be bound to facilitate the operations of all persons wishing to recruit workers, limited the intervention of officials to pointing out suitable places for recruiting and to giving advice. It forbade officials to accompany recruiters or to supply them with police, and discouraged the making of gifts by recruiters to native chiefs to secure labour. The decree of July, 1930, and the Colonial Law of November 15, 1933, formally prohibit official intervention in aid of recruiting; the administration retains, however, the right to take steps for the 'educational' encouragement of labour. It is claimed by Portuguese authorities that the considerable sums received annually by the state in capitation fees should be regarded as compensation for the loss of revenue due to the exodus of labour from Moçambique, and that a certain portion should be spent on native welfare.

V. PRIVATE EMPLOYMENT: THE REGULATION
OF RECRUITMENT(a) *The Recruiting Organizations*

Though there has been marked progress in the withdrawal of pressure in securing labour for private employment and a large increase in the flow of non-contract labour, Africa has not yet arrived at the stage when employers are able to secure the whole of their labour without some system of recruitment. In this respect Africa is not unique; most of the labour employed on the plantations of Ceylon is recruited from the neighbouring provinces of Southern India, the tea plantations of Assam require an annual recruitment of some 50,000 men, and there is a regular system of recruiting contract labour in French Indo-China. In the early stages of development in Africa it was mainly the larger mining undertakings which felt this need, but in certain areas farm or plantation workers had also to be recruited; the farms in Southern Rhodesia and Kenya, the oil plantations in the Congo, and cotton companies in the French colonies, all used recruiting organizations: and the recruiting of native labourers from Angola for the cocoa plantations on the Portuguese islands of San Tomé and Príncipe formed one of the blackest spots in the history of recruiting in Africa. Enough has already been said regarding past methods of dealing with labour to make it unnecessary to deal at length with the abuses which marked the earlier history of recruitment. There is now no territory where recruitment for private employment is officially carried out through an agency of government; such agencies can doubtless ensure improved methods of recruiting, but it has been realized that a state agency for recruitment inevitably involves some element of pressure. It is also practically impossible for a state agency for recruitment to distinguish between good and bad employers.

Private organizations have been extensively used to obtain labour which could not be provided by the native population in the vicinity of the enterprise, and some of the larger industrial undertakings continue to make use of them. The largest of these organizations are the Witwatersrand Native Labour Association and the Native Recruiting Corporation, which are responsible

for the transport of the recruited labour to the Rand mines, the former operating in Portuguese territory. Of late years the Native Recruiting Corporation has instituted an 'assisted voluntary system', under which a native who is unwilling to contract for as long as the normal period of 313 shifts is supplied with his railway ticket and food, and is permitted on arrival to engage himself at the mine of his choice. The system represents some advantage both to the mines and to the labourer; the mine is spared the capitation fee payable to the recruiting agent, and the labourer receives an advance free of interest. During the twelve months ending June 1933, 80,099 natives utilized this channel as compared with 47,772 in the previous year. Besides these major organizations many smaller agencies are licensed to recruit in the Union; in 1935, 529 recruiting licences were issued to agents, not all of whom were employed by the large recruiting organizations. There are numerous organizations which are not associations of employers, but private profit-making concerns, and the Native Economic Commission recommended that an effort should be made to encourage recruitment through larger units on a co-operative rather than a profit-making basis. It pointed in particular to the fact that the individual recruiter was responsible for a number of abuses, such as the luring away of juveniles. Complaints regarding this practice have been made also in the proceedings of the Transkeian General Council.¹

Of the 341,207 natives employed on the Rand mines at the end of 1936, 89,104 came from Portuguese territories, 49,582 from Basutoland, 7,521 from Bechuanaland, 7,316 from Swaziland, and 3,833 from other territories. Recruitment north of latitude 22 degrees south was forbidden in 1914, mainly on grounds of health, but on the recommendation of the Low Grade Ore Commission of 1931, an experimental recruitment of 2,000 was made in 1931 from Bechuanaland and Northern and Southern Rhodesia. Permission to recruit a further 3,000 was, with the sanction of the governments concerned, granted in 1935, the area being extended to include Nyasaland. The importation of tropical labour has now been legalized under the Immigrants Regulations Amendment Act, 1937. Portuguese recruitment has been secured by a

¹ *Proceedings and Reports*, 1934: see Chap. IX, pp. 353 ff.

series of conventions between the two governments. The first of these was made in 1909, but the treaty was denounced by the Union Government in 1922; a new convention was not concluded till 1928, and this was revised in 1934; it provided for a maximum complement of 80,000 recruits, and this was raised in 1936 by 10,000, subject to an annual review. It is an important feature of this system that recruitment is limited to a period of twelve months, renewable at the option of the labourer up to a maximum of eighteen months, and that after the first nine months' service one-half of the wages earned shall be deferred and paid through a Portuguese curator on the return of the native to his home. The Portuguese Government receives an annual capitation fee for natives recruited of not less than £2 4s. 6d., multiplied by the average number employed.

In South-West Africa, up to 1925, nearly all recruiting for mining or industrial purposes was undertaken by the government. Two native recruiting associations have since been formed, the Northern and Southern Labour Organizations, which work outside the Police zone. Within the Police zone there is no recruiting system, the natives finding employment themselves or with the assistance of a native welfare officer, but this officer does not recruit nor are traders allowed to do so. In 1936 the Northern Organization recruited 2,686 men and the Southern 2,265.

Labour for Southern Rhodesia was once secured through the Rhodesian Native Labour Bureau, established in 1906 with the aid of a Labour Fees Ordinance, which made subscriptions by mine-owners compulsory; it was placed on a voluntary basis both for mine-owners and farmers in 1911, and was subsequently assisted by a considerable subsidy from government. It, however, supplied only about 10 per cent. of the labour coming to the mines, and owing to difficulties between the mining and farming interests it had a chequered career and ceased operations during the depression period. The territory is largely dependent on outside labour; at the time of the 1936 census, of the number of natives in employment 42.5 per cent. were of Southern Rhodesian origin; 28 per cent. were from Nyasaland; 18.5 per cent. from Northern Rhodesia, and 10 per cent. from Portuguese territory. In 1914 Southern Rhodesia concluded an agreement with the Government

of Moçambique, renewed in 1934, providing for a maximum monthly number of 15,000 recruits. These numbers have never been recruited in practice, the number in 1935 being 7,100, but a considerable amount of voluntary labour crosses the border. A second agreement concerning native labour in Southern Rhodesia is that of August 21, 1936, made with Northern Rhodesia and Nyasaland; it deals with conditions of travel of migrant labourers and the improvement of conditions of labour; but its working is imperilled by the growing tendency for labourers to take advantage of the facilities for going to Southern Rhodesia and then to slip over the border into the Union, often taking the Messina mines as the first stage. It provides for a Standing Committee to secure co-ordination in labour policy, and for representatives of Northern Rhodesia and Nyasaland resident in Southern Rhodesia as Labour Commissioners.

In Northern Rhodesia, 53,462 natives were employed in 1936, within the territory, of whom a monthly average of 16,776 were in the mining industry, and 51,212 natives were estimated to be employed outside the territory.¹ Until recently two organizations were at work; the Rhodesian Native Labour Bureau recruited in Northern Rhodesia for employers in Southern Rhodesia, while in 1930 the copperbelt mining companies formed the Native Labour Association to provide for their own needs. Labour, however, now comes forward spontaneously, and the first of these organizations has gone into liquidation, while the second suspended recruiting operations in 1932. It is noteworthy that the copper mines do not now rely on long-term contracts, being able to engage labour on monthly agreements under which they are not obliged to pay the expenses of repatriation.

In Kenya and Tanganyika, private recruiters are licensed, but the majority of labour is obtained without the use of recruitment. The labourer receives a *kipande* or monthly work card, implying an oral contract for a month's work. The Tanganyika Committee of 1938 advises the continuance of the recruiting system in the interests both of the employers and the natives, and in order to abolish the present unsatisfactory conditions under which would-be workers travel long distances on foot without adequate

¹ See above, p. 606.

provision for their feeding or shelter.¹ In the British West African colonies recruitment has been little in evidence, and it is significant that the great majority of undertakings now obtain labour without the use of contracts. In the French territories no large recruiting agency now exists; in the Belgian Congo, of the recruiting agencies mentioned above,² only the *Union Minière* organization has operated in recent years. Agencies of this nature offer many advantages both to the labourers and employers, but are expensive in operation, the cost having at one time been £6 per man in South Africa, and £7 in Southern Rhodesia, and it is clearly to the advantage of the employer to encourage a flow of non-contract labour. Moreover, though such organizations work well for the larger concerns, they tend to break down in the case of limited needs.

Labour has of recent years tended to come forward spontaneously in increasing numbers, and the determining factor is now largely one of distance. Where the supply of local labour is insufficient the use of a recruiting organization is still needed, but in the case of the better undertakings, which can attract their own labour, this tends progressively to take the form of a forwarding agency, which assists the native to overcome the difficulties presented by the journey. Under the influence of changed economic conditions, and of the more systematic control now carried out by governments, a great improvement has taken place in methods used in recruitment. The business of the private recruiter is one which now requires appreciable capital and careful management, and reputation has become an important asset with employer and recruiter alike. Complaints certainly still exist, but they no longer refer to wholesale abuse, and centre for the most part on such matters as the methods used for recruiting youths and immature adults. It has further been observed that in South Africa the position enjoyed by the European trader in the reserves enables him to put pressure on natives to discharge their indebtedness to him by entering into labour contracts, for which he at the same time receives a capitation fee.³

(b) Rules regarding Recruitment

Although the Geneva Convention on the Recruiting of Indigenous Workers, which was adopted by the International Labour Conference in 1936, has not yet been ratified by any African power, it received general support in the Conference and ratification is being prepared in France and Great Britain. Before allowing recruiting, it would require the competent authority to take into consideration the possible effects of the withdrawal of adult males on the social life of the populations concerned, and to take measures to avoid the risk of pressure being brought to bear on behalf of the employers. It would forbid the recruiting of non-adult persons except for employment on light work under special conditions and with the consent of their parents. Wherever possible it would require the authorities to encourage recruited workers to be accompanied by their families. Chiefs and native authorities are to be forbidden to act as recruiting agents or to receive presents for assistance in recruiting; rules are proposed regarding medical examination and transport to the place of work.

At present all territories have their own rules.¹ The law in the Union² requires the deposit of a substantial guarantee by labour agents and brings their operations under the control of the Director of Native Labour. It prohibits resort to native headmen. The Act of 1921 limited the amount of advances given in connexion with labour service. The British colonies now require the recruiter to take out a licence and to furnish a substantial bond for observance of regulations. To take typical instances, the Northern Rhodesia Ordinance 56 of 1929 requires the agent to furnish a bond for £100, to specify the employers to be served, and to license all messengers, who must carry a badge. Uganda has a similar law, with a penalty of £100 and a year's imprisonment for infringement of recruiting regulations. In the Belgian Congo, the General Administration Ordinance of June 18, 1930, is the basis of the local ordinances regulating the conditions of recruiting. The Katanga Ordinances of August 30, 1932, and June 2, 1933, exact a high standard from the recruiter. A guarantee up to 40,000 francs

¹ See International Labour Conference *Report on the Recruiting of Labour*, 1935.

² Act 15 of 1911.

may be required; he must maintain adequate arrangements for food, housing, and medical attendance; must provide a special conductor for any party of more than twenty-five natives when travelling, and is under numerous detailed obligations in regard to the welfare of his recruits. The Belgian authorities are strict in the administration of this law. In French West Africa, the *arrêté* of March 29, 1926, established bureaux for employment, information, and statistics; these serve as intermediaries between employer and native, and supervise contracts. The Portuguese law requires a recruiter to furnish a bond, obtain a licence from the Governor, revocable at any time, and furnish evidence of good character.

In addition to the regulations applying to the recruiting agent, most countries lay down requirements to be observed in connexion with the transport of contract labourers, an important provision in view of the long distances which frequently have to be covered. Expenses for the journey from the place of engagement to the employment centre, and also for subsequent repatriation, are the responsibility of the employer; the sole exception to this rule being the Union of South Africa, and the High Commission Territories, where the native has to repay the cost of his journey. The refund on this account constitutes a considerable reduction of the wage earned; the travelling expenses of mine labour from the Transkei represents an average of 15 to 20 per cent. of their total cash earnings and in the case of workers for the sugar estates from 27 to 37·5 per cent.

This matter attracted attention in the discussion of the International Labour Conference at Geneva in 1935. The Committee of Experts expressed itself in favour of the principle that all expenditure on the journey and repatriation should be borne by the recruiter or employer; the South African employers are, however, understood to be opposed to this, on the ground that it would adversely affect the supply of non-contract labour. The Geneva report¹ of 1937 on the regulation of contracts of employment of indigenous workers recommends provisions for the repatriation by the employer of workers brought to the place of work and also for that of their families if they are authorized to be with them.

¹ International Labour Conference, 24th Session, Report 11, *Regulations of Contracts of Employment of Indigenous Workers*, Geneva, 1937, pp. 153 ff., 221-2.

The Geneva Convention on the recruiting of labour, already referred to,¹ has similar provisions regarding recruited labour. Conditions on the journey are now also generally covered by law; there is a tendency to substitute mechanical transport for marching. Thus the Belgian law requires the use of rail or steamer whenever possible, and prescribes the erection of camps at intervals of 30 km. if men are travelling on foot. Most countries regulate 'foreign contracts' with considerable severity. Thus the majority of British colonies require the Governor's approval on any foreign contract, and in addition a special bond is in some cases required; the unauthorized collection of men for employment outside the colony is heavily penalized. For instance, Kenya prescribes a fine of £100 or one year's imprisonment for this offence.² Nigeria restricts such contracts to countries approved by the Secretary of State.³ Since large numbers of natives travel to and from work without contracting themselves through a recruiter, certain governments also assist them by maintaining rest camps along the main routes; these provide rough accommodation, and a small dispensary to meet the needs of the sick or injured, but adequate provision remains to be made in most if not all territories.

(c) *The Future of the Recruiting System*

Statistics are not available to show what proportion of the total labour employed now comes in by recruitment. Even allowing for the abnormal conditions of the depression period, it is clear this has been a diminishing figure; it will depend in the future on the recurrence of any exceptional demand arising from the increase of mining or similar activity. The merits of the recruiting system formed the subject of a special study by the International Committee of Experts on Native Labour, whose report was considered at the nineteenth session of the International Labour Conference in 1935. They pointed out that the industrial history of countries of western civilization showed a tendency towards the adoption of the system of free public employment exchanges as a means of bringing employers needing labour and workers needing employment into touch with each other. In view, however, of the

¹ See above, pp. 628-9.

² *Laws*, cap. 139.

³ Ordinance 1 of 1929.

difference of the conditions in Africa, they did not think it advisable to suggest the universal replacement of recruiting by free public placing systems; they confined themselves to the hope that the recruiting of labour will be progressively rendered less necessary by such measures as the improvement of conditions of labour, the development of means of communication, and the creation of institutions under public supervision, as, for example, public employment exchanges, workers' co-operative, provident, or other associations, or organizations of employers. This aspiration is entitled to respect; and there are two factors of increasing importance which should not be forgotten: the desire of the native to choose his own employer, and his growing feeling that he dislikes being drafted about like cattle, as it was put in one area. It seems clear, however, that, though there is an increasing supply of unrecruited labour, some of the major industries are still likely to need the recruiting agency, and where labour comes from a distance, the agency can help the native in securing organized conditions of travel, and a guarantee of repatriation. There are some territories where, in the absence of an efficient recruiting system,¹ or of any recruiting or forwarding agency, natives now suffer great hardship in travelling long distances on foot in search of work, begging or working for their food from village to village;² again, where the labour reservoir is some distance from the area of employment, it is desirable to have some agency in the labourers' home districts which would enable recruits to be medically examined and enter into contracts, if only to avoid long and useless journeys by persons unsuited to employment. The provision of rest camps and the improvement of communications, both desirable, do not by themselves provide a complete remedy for the situation.

VI. PENAL SANCTIONS

In the majority of British territories penal sanctions are attached to labour offences; legislation of this type is, as will be seen, less conspicuous in British West Africa, and in the French and Belgian colonies. Penal sanctions apply to offences both by employers

¹ See *Tanganyika Committee*, 1938, *op. cit.*, p. 23.

² See *Report of Nyasaland Committee on Emigrant Labour*, 1935, pp. 25-8.

and employees, but for the present purpose the latter claim first attention. The offences penalized fall into two classes: first, breaches of labour agreements or action injuring the interests of employers; and secondly, infringements of safety regulations, or such action as constitutes a danger to public welfare. The study of legislation of this nature is complicated by the fact that in British areas the law is often of the 'omnibus' type, providing for both classes of infringement, and it accordingly embraces matters which elsewhere would be left to Factory Acts or to the operation of the ordinary civil and criminal law. There is, in consequence, a wide variation of penalty. Thus, any contravention of the Native Labour Regulations is, in the case of native labourers in the Union, punishable with a fine up to £10 or imprisonment up to two months for major offences such as breaches of Factory Acts or safety regulations, and by fines of £2 for minor offences, which are for the most part breaches of agreement and the like. In British West Africa the procedure has become one of civil jurisdiction only, and may be illustrated by the Gold Coast Ordinance of 1934. The court may adjust and set off claims between employer and employee, order the payment of damages, direct the fulfilment of the contract, or cancel it. Parties neglecting to carry out the orders of the court may be committed to prison for not more than three months. In other British territories penal sanctions exist; it is also usual to divide offences into major and minor. The 'minor' offence is punishable with fines amounting to a half-month's wages, as in Northern Rhodesia and Tanganyika, or one month's wages, as in Uganda, or of 3s., as in Nyasaland, with an alternative of one month's imprisonment; the 'major' offence is punishable with penalties which vary from a fine of £7 10s. and two months' imprisonment, to one of £10 and six months' imprisonment. The definition of the major offence is often such as to leave a considerable latitude of interpretation; it seems to include, for instance, neglect of animals in Northern Rhodesia, or the failure of a cattle herdsman to report the death of stock in Kenya and Tanganyika, both being offences to which importance is attached locally. In Northern Rhodesia the Mining Regulations of 1934 allow mine managers to impose fines up to £2 for breaches of

the regulations. In Tanganyika specific provision is made in the labour legislation for corporal punishment of juvenile offenders, but such provision is a feature of the general criminal law in other territories. In the Union the law goes farther; the Native Service Contract Act of 1932 permits the corporal punishment of male servants up to 18 years of age for any contravention of the Masters and Servants Acts.

In the French colonies legislation is more careful to discriminate between different classes of offences. Absence for a 'legitimate' cause only entails loss of wages; 'illegitimate' absence—that is, due only to the employee's inclination—is a breach of contract and amenable to penal law. Penal sanctions are applicable also to such offences as the completion of a fictitious contract, accepting other employment when under contract, or the like. There is no doubt that the effect of the punishment of *vagabondage* is in many cases the same as that of penal sanctions for breach of contract. Further, indirect sanctions are implied by the provisions which impose penalties on workers guilty of the so-called *délit d'emport d'avances*, that is, on workers who neither execute their contract nor repay the advances made to them at the time of their engagement.

In the Belgian Congo a decree of March 16, 1922, provides both civil and penal sanctions for breaches of obligations arising out of contracts of employment. Civil sanctions aim at prohibiting acts detrimental to private interests. They include the cancellation of the contract, damages for the employer, and coercive detention on failure to make restitution or pay costs ordered by the court. Employers may impose fines for offences against discipline, or against the rules of the establishment; the total of such fines may not exceed the wages due for the day on which the offence took place. In exceptional cases the employer may make deductions from wages on account of the loss or destruction of articles belonging to him, but decisions of the employer are subject to revision in the courts. Penal sanctions are to repress acts considered contrary to the public interest, such as fraudulently obtaining an advance (for which the penalty is three months' imprisonment), destroying a work book (50 francs or one week), or grave or repeated infringements of labour rules (50 francs or fifteen days'

imprisonment). Corporal punishment cannot be inflicted for labour offences.

The statistics published by the various governments do not provide information sufficient to judge of the manner in which the penal sanctions are used in practice. In the Union some 15,569 offences by native and coloured persons under the Masters and Servants Acts, and 16,861 under the Native Labour Regulation Act, came before the courts in 1936, but certain of the latter offences were breaches of pass and not labour regulations. Few of the published reports give any analysis showing the penalties imposed on employers and employees respectively. In the British areas the Tanganyika report of 1936 shows that there were 278 convictions of workers and 185 convictions of employers; in Kenya in 1935, under the Employment of Natives Ordinance, there were 151 convictions of Europeans, 99 convictions of Asiatics, and 833 convictions of natives. Under the Resident Native Labourers Ordinance the convictions were 74 for Europeans, 4 for Asiatics, and 945 for natives. In Nyasaland penalties do not appear to be frequently imposed: in 1935, only 67 persons paid fines and 33 were imprisoned. In Uganda in the same year 110 persons were convicted under the Masters and Servants Acts. There appear to be no published figures for Northern Rhodesia. In the French colonies disputes regarding labour contracts have been transferred from the ordinary courts to *conseils d'arbitrage*, specially constituted for this purpose; as a rule the local administrative officer is the president, with assessors consisting of equal numbers of colonists and natives.

The use of penal sanctions was, until fifty years ago, a conspicuous feature of labour legislation in Great Britain; it is still found in some parts of Europe and in Asia. In India the Act which penalized breaches of contract by workmen was not repealed until 1926. The necessity for maintaining provisions of this character in Africa lies in the absence of the factors which in modern economic conditions normally regulate the relations of employer and employee. The remedy of dismissal, although of increasing importance, is still ineffective in regard to a large proportion of African labour; the worker and his family are usually self-supporting units of village life, and wage-earning is often only supple-

mentary to labour for purposes of subsistence. It has again been found difficult to secure regularity of attendance or of systematic work among a population which is facing for the first time the conditions of organized labour in agriculture or industry; some past experiences show that there have been estates where a twenty hours' week has scarcely been attained, and an instance is known in which a small diamond mine had to stop when it rained because the employees went fishing.

In discussing the merits of the legislation in force in South Africa the Economic and Wage Commission of 1925¹ not only found its justification in the character of African labour, but emphasized the fact that it operated also to protect the employee; 'the clauses penalizing the master, which could not exist without those penalizing the servant, are very necessary for a labourer who has no possible chance of asserting his rights through civil procedure'. In this respect the Acts certainly have their value, but it is clear at the same time that they are on the whole designed to serve the interests of the employer rather than the employee, and lend themselves to abuse by a certain type of employer. Experience has shown that this is conspicuously the case in certain farming areas of South Africa, where many observers have held that the use of the penal sanction assists to maintain the labourer in circumstances approaching those of serfdom.² The Native Service Contract Act of 1932 has one very unusual provision: the contract entered into by a native is binding on his children up to the age of 18 years without their consent, and the penal sanction accordingly becomes applicable to the whole family. It may also be remarked that the native employee is less likely to have recourse to the courts than his master, and it is pointed out by Mr. Lucas in the addendum to the Native Economic Commission Report that the Acts make it impossible for natives to organize to protect themselves against exploitation.³ The Committee of Experts on Native Labour,⁴ when dealing with the question of the contractual employment of indigenous workers, recommends the gradual abolition of criminal penalties in the more usual cases of breach of contract,

¹ *Report*, p. 40.

² *Report of the Native Economic Commission, 1930-2*, U.G. 22, 1932, p. 216.

³ *Op. cit.*, p. 217, para. 281.

⁴ See above, p. 658.

and considers that in the case of refusal to commence or perform service, desertion, or neglect of duty, action should be by civil process only. The ideal is one towards which every administration should attempt to work, but the complete disappearance of criminal penalties must await the evolution of social and economic conditions which will replace the sanctions which penalties supply. In the meanwhile there is, at all events in South Africa, an obvious case for reconsideration of some of the provisions of the law and for the fuller application of administrative safeguards in order to mitigate its operation in practice.

VII. REGULATIONS IN THE NATURE OF PASS LAWS

(a) *Description*

It will be convenient to give here some account of the regulations generally described under the name of Pass Laws, though they are confined to certain territories and apply to a wider range of purpose than control over the movement of labour. Thus in the Union of South Africa, in which they appear in the most conspicuous form, they were originally of the nature of police regulations; they were subsequently utilized to assist in securing a supply of labour and to prevent desertion, and in their final stage, while still used to safeguard the labour agreement, they have become part of the machinery of the segregation policy, in so far that they are used to restrict the influx of a native population into urban areas. It will accordingly be necessary to examine not merely the pass laws properly so called, but the range of legislation which operates through the use of the pass or permit.

The South African Pass Law dates from the Earl of Caledon's Proclamation of 1809, which was designed to give a fixed domicile to the Hottentot nomad; persons who had no pass were treated as vagrants, liable to be contracted by the local authorities to any one they pleased, and on the farmer's own terms. The regulation thus bore some resemblance to the early English Vagrancy Acts, or the Statute of Labourers of 1351, which applied a similar system to check the movement of emancipated serfs or those who sought in other parishes the higher scale of wages which resulted from the labour scarcity caused by the Black Death. A further use was found for the pass regulation in order to prevent the influx of Xhosa into

the border districts and to control cattle theft. In the Cape Province the pass operated to secure the confinement of tribes to the Transkeian Territories and British Bechuanaland, and to restrict the movements of Africans out of these areas. The control of the movements of natives living within the Cape Province itself was effected through the operation of the Vagrancy Acts and cattle removal regulations; as a result the use of the law relating to the carrying of passes is now less in evidence in the Cape than elsewhere, and applies to 'foreign' natives only.

The earlier use of the pass system in the Transvaal and Orange Free State had a wider scope; it was directed not only to the control of the vagrant (*land-looper*), but to the stabilization of farm labour; a native could not travel unless he was in employ or was authorized to look for fresh work, and in the Transvaal the law added the penalty of flogging to that of imprisonment. The operation of these restrictions became more severe as natives tended to move off to the diamond-fields. The development of the gold-fields in turn saw a new use for the pass regulation. While the diamond mine protected itself against desertion and theft by the use of the 'closed' compound, the frequent desertions by contract labour on the gold-fields were met by regulations creating 'labour districts' within which any native found without a pass was liable to arrest. It remains to notice the final development of this type of legislation. The Natives (Urban Areas) Act 21 of 1923 made use of the pass system in order to control the entry of natives into the towns, and legislation subsidiary to that Act, such as the 'curfew' regulations or provisions made under the Native Taxation and Development Act 41 of 1925, assisted to regulate their movements within the urban area. The system has been further developed by the Native Laws Amendment Act of 1937, which permits the removal from urban areas of labour in excess of employers' requirements.¹ The pass system has also been employed as part of the machinery of the land policy; the Native Service Contract Act 24 of 1932 utilizes the pass, in the manner shortly to be described, in order to ensure that natives residing as labour tenants on private farms shall not evade their obligations towards their landlords.

¹ See Chap. IX, pp. 501-2.

The use of pass regulations in the Union presents, therefore, a complicated picture, and it may be convenient to give a detailed statement of the position in the different provinces. In the Cape Province, Act 22 of 1867 is still in force, under which passes are required by 'foreign' natives on entering the colony. In effect, this means that passes are now required only by natives moving into the Cape from South-West Africa or the Protectorates, or in and out of British Bechuanaland, and in and out of the Transkeian Territories; no pass is required to travel inter-territorially within the Transkei.¹ Elsewhere in the Cape no pass is required, but the provisions of the Vagrancy Act 23 of 1879, as amended by Act 27 of 1881, are still available to check 'vagabondage'. As regards other legislation making use of the pass system, the Natives (Urban Areas) Act of 1923, amended by Act 25 of 1930, provides that a native entering a proclaimed urban area must obtain a permit to seek work, and when work is obtained his employer must register the contract of service. The permit to seek work is usually limited to a few days' duration, and unless it is renewed the native is liable to arrest. Act 25 of 1930 provides for control of natives in specified urban areas between certain hours by means of the curfew rule; no native (except the exempted classes) may be in any public place between the specified hours without a permit. Most of the large towns, except Capetown and Port Elizabeth, have applied this law. Regulations made under section 23 (3) of Act 21, 1923, further allow the local authorities to issue permits to different classes of natives as evidence of their right to live in urban locations; without such a permit the native is subject to arrest or expulsion.

In the Transvaal and Orange Free State the pass system proper is stricter and more widely used. The Native Administration Act 38 of 1927 provides that regulations in the nature of pass rules may be made by the government, and in the exercise of this authority the government issued Proclamation 150 of 1934, which requires a native to take out a pass to enter or travel within any pass area—that is, anywhere within the two provinces excepting

¹ British Bechuanaland Proclamation 2, 1885; Proclamations 110, 1879 (Transkei); 112, 1879 (Griqualand East); 140, 1885 (Tembuland); 340, 1894, and 497, 1895 (Pondoland); 109, 1894 (Transkeian Territories).

native areas scheduled under the Natives Land Act of 1913. The system is to some extent mitigated by the issue of travelling passes by officials and owners of farms, and by the grant of general and special exemptions. As regards other laws utilizing the pass system, the Native Labour Regulation Act 15 of 1911 applies in the mining areas; under this a native employed in a 'proclaimed labour district' is required to obtain a permit from his employer if he wishes temporarily to absent himself from the property on which he is employed. The urban conditions are, as in the Cape, regulated under the Natives (Urban Areas) Act of 1923, to which reference has been made. In addition, the Native Service Contract Act of 1932 applies in both provinces. This Act requires a native resident on a private farm—that is, in effect, all labour tenants—to obtain a document of identification before proceeding to any other place than his home; no one may employ a native unless his document of identification bears an endorsement by the owner of the farm on which he is resident authorizing him to seek fresh employment. Further, the Natives Taxation and Development Act of 1925 provides that any receiver of native tax, any European member of the police or a chief or headman, may demand production of a tax receipt; in default of producing such receipt a native is liable to arrest. As some mitigation of the effect of this measure the tax receipt and the document of identification above referred to have been merged in one document. In Natal the Pass Law proper, Act 48 of 1884, provides only for inward and outward passes, which are in the nature of passports; natives resident within the province may travel without passes. But the Natives (Urban Areas) Act of 1923, the curfew rules under Act 25 of 1930, the Native Service Contract Act of 1932, and the rules under the Natives Taxation and Development Act of 1925, are in force.

Viewed as regulations for the control of industrial labour, the laws making use of the pass system are, as will have been seen, in fullest operation in the Transvaal and in the Orange Free State; as measures for control of farm labour they operate fully in the Transvaal, Orange Free State, and Natal; the restriction on movement to and within the urban areas operates in the 'proclaimed' towns in all four provinces. The oppressive and, indeed, obnoxious nature of some of these regulations, and their liability to misuse

both by employers and police, led to the appointment of committees of inquiry in 1914 and again in 1919.¹ It hardly required the evidence which these investigations elicited to demonstrate that the powers conferred by the regulations were widely abused, or that the ease with which they were evaded by criminals made them ineffective for some of the purposes for which they were designed. There was, on the other hand, a general agreement that some system of identification was required, not merely for occupational but police purposes; in the words used by Lord Milner in 1902: 'Alike for the protection of the natives and for the protection of the whites it is absolutely essential to have some reasonable arrangement by which the incoming native can be identified and his movements traced.'² A measure, entitled the Native Registration and Protection Bill, was put forward in 1923 with a view to simplifying the procedure, but was not proceeded with, though some simplification of the urban regulations was effected when the Natives (Urban Areas) Act of 1923 was passed.

The Native Economic Commission of 1930-2³ pointed out that the pass regulations, apart from their generally oppressive nature, had the effect of creating a large volume of technically criminal offences which carried no moral opprobrium. The extent to which this remark is justified is revealed in the figures already quoted.⁴ The Commission pointed further to the significant fact that out of 42,000 convictions against the pass laws in 1930 no fewer than 39,000 were from the Transvaal alone. That some measure providing for identification is necessary may be admitted, but the system as a whole still awaits the reform which it obviously requires. Apart from the effect which the use of regulations of this type must have on the attitude of the native towards the law of the country, the opportunities afforded for abuse by subordinate officials are such as to bring the administration under justifiable criticism.

In South-West Africa natives require a pass to go from one reserve to another or to enter an urban area, where they must be registered on obtaining employment. The Native Affairs Department can close urban areas against fresh natives coming in to seek

¹ *Report of the Interdepartmental Committee on Native Pass Laws*, U.G. 41, 1922.

⁴ See above, p. 662, and Chap. VII, p. 282.

work, in order to restrict the number of natives to the bare requirements of urban employers. Southern Rhodesia and Kenya have pass systems, but in both cases the regulations are simpler and less exacting than those of the Union, partly because of historical differences, but largely because the system of registration in force acts as a measure of control. In Southern Rhodesia the Native Pass Ordinance of 1913, as amended, requires all indigenous males over 14 years of age, and all non-indigenous males of that age entering the colony to obtain registration certificates. The non-indigenous males must also take out passes to travel within the colony in search of work. Within the towns natives engaging for work (and their employers) must enter into contracts of service stating rates of wages before a registrar. These contracts are mostly for periods of one month, but the parties can, if they so desire, contract with each other for longer periods. This provision has been re-enacted in the Natives Registration Act of 1936, which also provides an extended system of control over natives entering scheduled townships. Outside the native locations established under the Native Urban Locations Ordinance of 1906 a modified curfew law is in force in the towns. Natives entering them must obtain a pass to visit or seek work, which may be refused for specified reasons. The Act provides for the appointment of registrars of natives and Town Pass Officers, who are to assist natives to find employment and to aid and protect them in their transactions with Europeans.

Kenya has carried the registration system somewhat further. The use of pass laws originally arose in the need for a measure of defence against wandering tribesmen and stock thieves; it was only at a later date that they were utilized to meet labour difficulties. The registration of labourers, as introduced under the Masters and Servants Ordinance of 1910, proved ineffectual, and the government, on the advice of the Native Labour Commission of 1912-13,¹ adopted the Southern Rhodesia law of registration. Every native over the age of 16 years must register and carry a registration certificate,² but the latter provision is, in practice,

¹ *Report*, para. 3, p. 335.

² *Report on the financial Position and System of Taxation in Kenya*, 1936, Colonial 116, para. 224.

applied only to natives outside the reserves. An employer must endorse this certificate on engagement and discharge, and fresh employment is not legal without this formal discharge. As the result of experiences with the carrier corps during the War a Central Registry had been established, which contained records of all the certificates registered. It was an institution to which the administration attached importance as a means of establishing identity and preventing fraud, but it has now been abolished. The pass system in Kenya has its critics,¹ but there is not the same complaint as in the Union of the abuse of the regulations. It is in particular noteworthy that executive orders prohibit police officers below the rank of sub-inspector from arresting natives on the ground that they do not hold a registration certificate.²

Northern Rhodesia has a Native Registration Ordinance, 50 of 1929, but its system of registration differs from that of Kenya, as it has no central bureau of registration. It may be noted that the prevalence of the wandering wage-seeker has of late years created a problem of much difficulty to the administration. The system was introduced to check desertions, but it appears to be inefficient as a means of establishing identity, and many employers hold the view that the procedure needs revision. In Nyasaland no passes are required, save for natives leaving the protectorate, a provision which has fallen largely into disuse, but the Committee on Emigrant Labour, 1935,³ advocated the introduction of a pass system as a means of ensuring the identification of the labourer; it is noteworthy that they found no evidence that registration in Kenya and Southern Rhodesia imposed any real hardship on the native. In Tanganyika a system of registration was recommended by a government committee sitting in 1929, and the Identification Ordinance of 1935, which applies to members of all races, requires a person not holding a passport to carry an identification certificate if he leaves the province in which he is domiciled. The ordinance, however, has not been put into effect. The committee of 1936-7 appointed to advise on questions relating to the supply and welfare of native labour considered that the cost of such

¹ See N. Leys, *Kenya*, 1924, p. 389.

² *Report of the Commission of Enquiry into the Administration of Justice in East Africa*, Cmd. 4623, 1934, p. 83.

³ *Report*, op. cit., para. 132.

a system places it outside the realm of practical politics. It suggested that facilities might be made available for voluntary registration to provide evidence of domicile.¹ A pass system, designed to exclude undesirables, operates in the area of the Lupa gold-fields. The pass system is not used in the British West African colonies, though in the Gold Coast domestic servants of Europeans are registered by the police.

In the French colonies there is no system of passes prescribed by law. The law, however, provides that a native on entering employment must receive a *livret d'identité* containing personal details and particulars of engagement.² This regulation is intended to apply mainly to persons seeking industrial employment, but the administration applies by local order a temporary system of passes to regulate movement in areas suffering from epidemics. In the Belgian Congo there is also no regular pass system, but as part of the labour regulations an employee receives a *livret de travail* containing details of the times and conditions of employment, engagement, and discharge. The importance attached to the stabilization of domicile within the *circonscription* has led to the adoption of a system by which a native must obtain a *passeport de mutation* before he leaves his district or goes to an urban centre; this may be either temporary or 'definitive'. The system is used to restrict movement in the case of epidemics, or during the continuance of an intensified campaign of medical work in a particular area, and also to prevent excessive numbers of men from leaving certain areas. In the Portuguese areas natives leaving reserves to seek work must obtain a 'native card', and must, on entering employment, obtain a work card from the employer.

(b) *General Conclusions*

In judging the merits of the pass system it is necessary to discriminate between what may be described as its direct and its indirect use. The former is limited to securing a means of identification and to assisting in the maintenance of contractual obligations; in the latter, the pass is an instrument serving some aspect of political or social policy. Thus, as has been shown, in the Union

¹ *Report of the Committee appointed to consider and advise on the Supply and Welfare of Native Labour*, 1938, p. 42.

² A.O.F. *Arrêté* of March 29, 1926. A.E.F. Decree of May 4, 1922.

the Natives (Urban Areas) Act of 1923 and the Native Service Contract of 1932 include, as part of their machinery, the use of a pass system which is undoubtedly burdensome in its operation; the justification for the system must in this case depend on the merits of the general policy which it serves. There is, on the other hand, a general agreement on the merits which the pass possesses as a means of identification and of assistance in the observance of labour agreements both by employer and employee. Here it has a legitimate function, and it becomes oppressive, as the various authorities who have advised on the subject have pointed out, only if the procedure for its use is complicated, or if precautions are not taken to avoid its abuse by subordinate officials of the government or native administrations.

VIII. WELFARE AND WAGES

(a) The Regulation of Welfare Conditions

All the territories under review have now made provision, in greater or less measure, for safeguarding the welfare of labour. The laws vary greatly in character, and it is only possible here to discuss the more important provisions, such as those relating to the regulation of diet and working hours, housing, and compensation for accident or disease. In the Union the employment of a large number of Europeans and the comparatively high degree of industrialization have presented many problems of a type familiar in older countries. The Department of Labour and Social Welfare, established in 1924 after the constitution of a Ministry of Labour, was, in 1937, divided into departments of Labour and of Social Welfare; they administer employment exchanges at the chief urban centres for European adults and juveniles, and also for coloured persons at Capetown and Kimberley, while at some 200 other centres post offices serve as subsidiary exchanges. The departments' other functions include the training of indigent Europeans for employment, the initiation and control of schemes for the relief of European and coloured unemployment, and the development of social work amongst Europeans, for which purpose a Commissioner of Social Welfare and a number of rural welfare officers were appointed in 1935. An inspection staff of fifteen supervises the conditions of factory labour, which are adequately regulated by

rules under the Factories Act of 1918 as amended by Act 26 of 1931. The regulations place restrictions on the working hours of juveniles and women, and the Mines and Works Act, 1911, and the Factories (Amendment) Act, 1931, prescribe a 48-hour week.

The conditions of health, housing, and diet for natives employed on mines and works in proclaimed labour districts are governed by the Native Labour Regulation Act of 1911, which leaves a wide discretion to the executive in making rules for the purpose. The operation of the Act is entrusted to a Director of Native Labour, with head-quarters at Johannesburg. The compounds of the Rand mines are open to the objections inherent in a system which brings together a very large number of male workers, removed for periods lasting from twelve to eighteen months from any possibility of contact with domestic life; so far, however, as the arrangements for housing and diet are concerned, the larger mines have admittedly set a high standard; the provision made is liberal and well planned, while health conditions receive careful and scientific study. The mortality rate in 1936 was 7·06 per thousand.¹ The overcrowding that once existed on some of the smaller properties is now being reduced through the activities of the Public Health Department, which requires new barrack rooms to conform to certain specifications. The department also supervises housing on the Natal sugar plantations, where the campaign against malaria has drawn attention to the existence of many unhygienic compounds for native labour. The conditions of farm labour are not subject to inspection, nor are minimum standards of diet, housing, and medical attention prescribed; but the grazing and arable rights granted to many natives on European farms, and the fact that the worker leads his own domestic life, give some attraction to agricultural employment in spite of the unfavourable nature of other conditions. The general position of the labourer seems to justify the recommendation made by Mr. Lucas,² as member of the Native Economic Commission of 1930-2, that inspectors should be appointed for farm labour, and in particular to supervise the operation of the Masters and Servants Acts.

¹ *Transvaal Chamber of Mines, Annual Report, 1936*, p. 6.

² *Report of the Native Economic Commission, 1930-2, Addendum*, para. 280.

Compensation for industrial disablement is provided under the Workmen's Compensation Act of 1934. Up to the passing of that Act, compensation for natives was available only under the Native Labour Regulation Act of 1911, which made no provision for temporary disablement. The Act of 1934, which applies to natives, constitutes a material improvement in this and other ways; it makes provision for the appointment of an officer of the Native Affairs Department for examining into cases entitled to compensation, and assessing and collecting the amount due. Compensation for the special disability arising from silicosis in the mines is provided under the Miners' Phthisis Acts, which were consolidated in Act 35 of 1925.¹ Compensation is on a markedly liberal basis for Europeans; the scale for natives is lower, and it has been maintained that natives, owing to the intermittent character of their employment, are less susceptible to the disease.² The compensation given to natives might prove to be of greater benefit if the system permitted of the grant of a pension in suitable cases, instead of a lump sum.

In South-West Africa compensation for disablement or death is provided by Proclamation 27 of 1924. Inspection of labour is at present confined to the employment of an inspecting officer at the Tsumeb copper mine when it is working, and another officer in the Lüderitz diamond-fields.

In Southern Rhodesia there is no separate Department of Labour, but under the agreement with Northern Rhodesia and Nyasaland³ the number of Native Department Inspectors will be increased from two to seven. The conditions of native labour are regulated by the Native Labour Regulations Ordinance 1911 and regulations framed thereunder, and the Masters and Servants Ordinance 1901. For mine labour there are comprehensive regulations framed under the Mines and Minerals Act, 1935, with standards of diet and housing. Compensation for industrial disability is provided under Ordinance 15 of 1922 as amended by Act 16 of 1930, but it is awarded on a fixed scale which makes no provision for natives drawing anything but low rates of pay. It would seem that conditions in the larger mines are adequately

¹ See Chap. XVII, p. 1148.

² *Report of the Low Grade Ore Commission*, U.G. 16, 1932, par. 104.

³ See p. 654, above.

supervised; the conditions in the numerous small mines and undertakings dealing with alluvial or quartz workings, where labour is often of a casual nature, have received little attention. The Wankie coal mines stand by themselves in the extent of welfare provision; the labour here is largely 'stabilized'.

In Northern Rhodesia conditions are regulated by rules made under the Employment of Natives Ordinance of 1929. Regulations of 1931 laid down a scale of diet for natives employed in mines and works and provided for minimum housing requirements.¹ The ordinance provides for the payment of compensation in lump sums. Accidents in the mines sometimes result in cases of blindness and total disablement, and provision for pensions seems desirable. Ordinance 41 of 1930 provides for the appointment of a Commissioner for Labour and labour officers, but no action in this regard has been taken as yet, supervision remaining in the hands of administrative and medical officers. The establishment of a Labour Department is, however, under consideration. The main problem of industrial labour in Northern Rhodesia is that of the mining population in the copperbelt, the monthly average of men employed in 1935 being 18,464. The mine companies provide food, housing, and medical attendance: the standard is liberal and well planned. Labour is employed at the mines on a monthly 'ticket', and while the copper mines have not yet adopted any fixed policy of 'stabilization' of labour, similar to that now in force in the Belgian mines,² they have of recent years made a considerable provision for families in the labour lines. Schooling has been left to the enterprise of the United Copperbelt Missions, who have received small grants from the mining companies, but government is now building three elementary schools; recreational schemes are organized by the mines, missions, and in connexion with the beer canteens. The period of construction was marked by a high rate of sickness and mortality; but the mortality rates from sickness had fallen to 10·8 per 1,000 in 1932 and 7·87 in 1933; an increase in 1934 to 13·6 was attributed to influenza. The fatal accident rate is approximately the same as in the Union mines, being 2·64 per 1,000 in 1934. Little supervision is exercised over the conditions of farm labour, the wages are low, and the conditions

¹ See Chap. IX, pp. 512-15.

² See below, p. 681.

as regards housing and rations are officially described¹ as being frequently far from satisfactory.

The Nyasaland rules of 1914 contain a minimum scale of diet and provide that conditions regarding housing may be inserted in contracts; there is little labour of the industrial type, and inspection is left to administrative officers. In 1936 Kenya had 182,858 natives registered as in employment; of those about 11,000 were employed in mines and 28,160 on railways, harbours, and other government works, while a small number were employed in minor industries such as sugar and saw mills. The colony has recognized the importance of the supervision of labour conditions, and has instituted a labour section under a Principal Labour Inspector, with four labour officers; the regulations prescribe a scale of diet, but this applies so far only to men in government employ. The labour section gives attention to conditions of labour employed on farms, mines, and works of all kinds, and arranges for the repatriation of vagrants and discharged prisoners. It undertakes the maintenance of rest camps and of an employment bureau. The few large mining undertakings make suitable provision for the welfare conditions of their labour; the conditions of labour in the alluvial diggings, where labour is largely casual, leave much to be desired. Compensation for disability among miners is governed by an amendment (1934) to the Mining Ordinance.

Tanganyika appointed a Labour Commissioner and labour officers under the Masters and Servants Ordinance of 1928, but this establishment was abolished in 1931, the bulk of labour supervision being transferred to administrative officers. The law, at present, does not prescribe scales of diet or housing, but penalizes conditions shown by inspection to be inadequate. Compensation for injuries is provided under section 29 of the Masters and Native Servants Ordinance, and section 9 of the Mining (Amendment) Ordinance 1931. For general labour purposes one officer of the Labour Department has been reappointed, and an officer has been posted to deal with labour conditions in the Lupa gold-fields.² The Report of the Committee of 1936-7 on the Supply and Welfare of Labour gave details of the unsatisfactory conditions

¹ *Annual Reports on Native Affairs*, 1934, p. 27; 1935, p. 19.

² But see below, p. 677.

on the Lupa gold-fields; evidence of inadequate supervision of health conditions on plantations had already been provided by a representative of the Ross Institute of Tropical Hygiene. The Committee recommends the restoration of the Labour Department under a Chief Inspector of Labour, and the formation of a Labour Advisory Board, and considers that the labour inspectorate should pay particular attention to the conditions of the employment of young persons, as it finds that children are working in the ginneries on shifts of eleven to twelve hours, a state of affairs which, it suggests, also points to the urgent need of legislation to limit the duration of working hours.¹ Among the recommendations of the committee are statutory compensation for workmen and minimum wage-fixing machinery. The government has in view labour legislation which will presumably include many of the recommendations of the committee. The unsatisfactory nature of the conditions prevailing among the large population of natives on the scattered workings of the Lupa gold-field was admitted by the government in its report to the Mandates Commission,² but steps have now been taken to improve them. These conditions were no doubt partly due to the system of granting licences to individual prospectors who have not the means nor the will to provide the facilities which are available to the employees of large companies. It is, however, also true that the government did not until 1937 provide adequate control over the operations of the prospectors, nor did it make adequate medical provision for the workers.

In Nigeria the problems connected with industrial labour exist mainly in the tin mines, where a monthly average of 18,600 workers was employed in 1935, and in the alluvial gold-fields, which had a labour force of about 14,500. Regulation 6 of 1929 makes special provision for areas proclaimed as labour health areas, in which definite standards of diet and medical attendance are prescribed; elsewhere, welfare obligations are of a general character only. Compensation for injuries in mining employ is provided under the Minerals Ordinance, and under the Labour Ordinance of 1929. It is important to note that supervision and

¹ *Report*, 1938, p. 35. A Chief Inspector and seven officers are being appointed in 1938.

² *Report to the Council of the League of Nations on Tanganyika Territory*, 1936, p. 81; *Minutes of the Thirty-first Session of Permanent Mandates Commission*, 1937, pp. 41-6.

inspection remain in the hands of administrative officers. Labour in the tin mines and in the gold-fields is mostly on weekly agreements: it does not come from any considerable distance, and provision for housing or other amenities is not made on any prescribed scale. Labour on the government coal mine at Enugu, however, is of a more stabilized character, and adequate arrangements are made for housing and sanitation. The advantages of a proclaimed labour health area may be seen in the Cameroons; the plantations here employed about 15,000 workers in 1935, and the provision for housing and medical attendance is on a prescribed scale. The Nigerian Labour Regulations provide that no labourer shall be allowed to work more than ten hours a day.

In the Gold Coast the gold industry employed in 1935 a daily average of about 34,000 men. Throughout the Gold Coast labour is, as in Nigeria, engaged on daily or weekly rates, and there is little use made of the labour contract. As in Nigeria, provision is made for proclaiming mining health areas, but enforcement of the regulations is only now being taken in hand, and no special inspectorate has been appointed. The larger mines provide housing arrangements and adequate medical attendance, with the result that the daily labour turn-out has become more satisfactory; but considerable difficulty is experienced by these mines, owing to the fact that they have little control over the settlements on private property near the mines. Elsewhere, little provision exists for housing, nor are welfare conditions under definite control. There is as yet no legal provision for workmen's compensation, nor is there any statutory regulation of hours of work; the average period of labour in Gold Coast mines appears to be eight hours for underground, and nine to nine and a half hours for surface workers.

Labour regulations in many of the British colonies have a common characteristic: they avoid laying down definite standards in regard to diet, housing, or medical attendance, and leave in these matters a considerable discretion to inspecting officers. Particular importance accordingly attaches to the character of the organization for inspection and supervision. The matter is indeed one of special importance in any situation in which contract labour is largely used. Whatever advantages contract labour may possess in other directions, it inevitably has one disadvantage, that

unless there is adequate supervision by the state, it weights the scale in favour of the employer, in so far that it is easier for him than for the labourer to evade his obligations. In Europe the earlier attempts to improve mine and factory conditions failed of effect until a technical inspectorate was appointed; this was conspicuously the case in regard to the regulation of hours of labour for women and children. It is, indeed, obvious that the efficacy of social legislation as a whole is dependent on the technical inspectorates which are the most significant creation of modern administrative activity. In the preceding pages some details have been given of the extent to which an organization for this purpose exists in the Union and the British colonies, and similar details will subsequently be given in connexion with the French and Belgian territories. It has been shown that, with the exception of Kenya, inspection in the British colonies has for the most part been left to administrative officers.

That it is advisable for officers of the administration to keep in close touch with labour conditions admits of no question; but experience shows that their other duties do not always permit them to exercise that close supervision which is essential when large bodies of labour are employed. The Report¹ of the Commission on the Disturbances in the Copperbelt of Northern Rhodesia pointed out in 1935 that District Officers had inadequate acquaintance with the conditions in the compounds, and stated that the mining authorities themselves would welcome a closer contact on their part. The Committee on Emigrant Labour in Nyasaland² stated that their investigations had been hampered by an absence of reliable statistics of labour emigration, and emphasized the need of a labour department to supervise the safeguards which they thought necessary.³ Reference has been made on a preceding page to the similar recommendations made in regard to Tanganyika. The value of a specialized labour department is by no means confined to the exercise of closer inspection; it is, as pointed out by the Nyasaland Commission, equally essential in order to place the administration in a position to deal with the wide range of problems, vitally affecting many aspects of native life, to which the movement of labour gives rise.

³ *Report*, 1936, paras. 74, 165.

French legislation on welfare conditions is fuller and more precise in form than that of many of the British colonies. The *arrêtés* of March 29, 1926, in French West Africa and February 11, 1923, in Equatorial Africa prescribe a maximum of ten hours' labour both for industrial and farm workers, with a special provision in the latter territory that the hours must not exceed six per day in the first and eight in the second month of employment. A decree of French West Africa dated September 18, 1936, laid down special conditions for labour of women and children, including a childbirth interval. Detailed standards are prescribed for medical facilities. Compensation for industrial disablement is provided by the decree of April 2, 1932, which was applied to French West Africa on July 30, 1936, and there is special provision made to assist workmen in effecting savings, through the system of the *timbre de pécule*. There is an inspectorate establishment in French West Africa with a specially trained personnel; the inspector has authority to arbitrate in disputes or refer to the *conseils d'arbitrage*.¹ The inspectorate in French Equatorial Africa, established by an *arrêté* of August 24, 1936, is on a less developed scale.

Attention has been drawn in previous pages to the close study given to labour in the Belgian Congo.² Welfare conditions there are governed by detailed regulations. The principal law is the decree of March 16, 1922, which, among other matters, gives power to local authorities to prescribe a statutory scale of diet for workers. This has been implemented by local regulations laying down scientifically balanced scales of diet, and requiring employers to supply all manual workers with prescribed rations in addition to the cash wage. The dietary of labour has received in the Belgian Congo a systematic study to which the only African parallel is that made by the health organization of the Rand mines. Another characteristic feature of the Congo is the provision in each province of an Advisory Council for labour questions consisting of five officials and five non-officials. Supervision is carried out by a special organization, centring in the labour office at Léopoldville, with a local inspectorate, and a labour officer has recently been appointed for the mandated territory of Ruanda-Urundi. The

¹ See above, p. 662.

² See above, pp. 644-8.

inspectorate is active; but apart from this, there is every evidence of the attention which the larger industrial organizations pay to the welfare conditions of their labour.

The scarcity of local population led in the earlier days of the Katanga enterprises to the recruitment of natives from a distance, and as a result of the high percentage of disease experienced, and of the disturbance to native life in the areas of recruitment, the mines have progressively adopted a policy of 'stabilizing' their labour, some aspects of which have been described.¹ Stabilization is also a necessary corollary of the policy under which Africans are given the fullest opportunity to qualify themselves to take the place of Europeans in skilled processes.² It involves a policy of engagement on long term contracts, the normal period being three years, and of encouragement of family residence; the *Union Minière du Haut Katanga* assists workmen to provide the dowry for their marriage, and its very complete maternity and child welfare service has already been referred to.³ In many cases family allotments are provided; older men are employed on farms organized by the company. In 1934 over one-third of the labour was accompanied by its families, and this figure has apparently since increased. The sickness and mortality figures, which in the earlier stages of work were high, owing to the fact that a large proportion of the recruited labour was brought from long distances, have now been greatly reduced. The mortality in 1914 was no less than 117.7 per 1,000; it had fallen to 12.03 in 1931⁴ and in succeeding years was 8.23, 7.01, and 5.94. The food supplied is calculated to cost 4.69 francs a day against the average pay of 3.72 francs. A similar system has been introduced in the Kilo-Moto mines; here, however, the mortality figures are higher, being in 1933 between 15.7 and 16 per 1,000. The concessions given of recent years require expenditure to be made for social work on behalf of labour. An instance of this kind is the expenditure of the *Huilleries du Congo Belge*, which has spent in the last five years

¹ See M. Engels, *Problème de la main-d'œuvre du Congo belge*, 1931.

nearly 17,000,000 francs on medical work,¹ and over 5,000,000 francs on education.

In the Portuguese territories the former law regarding labour, the Native Labour Code of 1928, was revised in the Law of November 15, 1933. This law contains provision for rules establishing minimum wages, insurance for industrial disability and pensions, and welfare conditions; it remains, however, to be implemented by the issue of local regulations. It further makes provision for a labour inspectorate, to be controlled from Lisbon, but it is understood that this has not yet been appointed. An order of July 1930 prohibited the sale of alcohol to employees, and in the opinion of those who have had experience of previous conditions in these areas, this provision will, if it can be carried out, effect a much needed reform.

(b) Wage Determination and the Civilized Labour Policy

There is an aspect of state policy in certain African territories which has a conspicuous effect on the position of native labour in industry, and on its capacity for wage-earning. What has come to be known generally as the 'civilized labour policy' is, as will be seen, a feature confined mainly to the Union and Southern Rhodesia, where the employment of a resident white population has in recent years become a question of political and social importance. The general policy of the Union has been described elsewhere² as regulated by the determination to maintain the essentials of European civilization in the interests of its white population. In the economic field this policy has two objectives: first, the maintenance of the wages of all European employees at standards appropriate to 'civilized labour'; and secondly, the restriction of the native in European-settled areas to unskilled labour, remunerated at rates suitable to native conditions. The essential feature of these conditions is assumed to be, that the native employee is not entirely dependent on wage-earning, and that he and his family can, if necessary, draw their subsistence from the land, the wage thus representing only a means of satisfying requirements which have to be met by cash expenditure. The difficulties inherent in the maintenance of an economic re-

¹ See Chap. XVII, p. 1180.

² See Chap. V, pp. 130 ff.

lationship of this type in a modern industrial state are discussed elsewhere;¹ here it is proposed to refer only to certain features which characterize the present operation of this policy.

The high standards of pay of European employees, as the analysis contained in the report of the Economic and Wage Commission of 1925² shows, are due to the historical circumstances under which industry has developed in South Africa, and they are to-day maintained chiefly by the prosperity of the gold industry. While comparison between the wage rates of different countries is not easy, owing to the difficulty of determining real wages, the figures prepared by the Statistical Department of the Union³ provide a useful indication of the position of European labour in South Africa relative to that in other countries. Taking the building trade as typical, it is shown that in 1934 the weekly wage in South Africa was 122s. 1d. as compared with 102s. 7d. in Australia, 90s. 9d. in New Zealand, 133s. 10d. in Canada, and 65s. 6d. in the United Kingdom. The indices of real wages in the building trade compare as follows: South Africa 1,092, Australia 1,146, New Zealand 1,009, Canada 1,436, and the United Kingdom 883. For the present purpose, however, the fact of major importance is not the general pitch of European wages, but the relation of European wages to those of unskilled labour, which is predominantly, if not exclusively, native or 'coloured'. The precise relation cannot be stated in terms of average figures, owing to the variety of rates paid in the secondary industries and on the farms, but there are certain figures which supply an adequate illustration. The average pay of the European employee in the mines, on the basis determined by the Wage Board in 1927, worked out in 1930 to £31 7s. a month; that of the native employee worked out in the same year to 57s. 6d. a month, but to this must be added a sum representing the calculated cost of food, and other charges borne by the mines. The value of this to the native has been stated to be 1s. 4d. or 1s. 6d. a day; calculations made by the Native Economic Commission⁴ in regard to a number of mines showed the cost to them as 8-46d. for food and hospital privileges, and other services such

⁴ *Report*, U.G. 22, 1932, paras. 819-20, 824-5.

as repatriation of sick workers and irrecoverable advances, but not including the cost of quarters. In the secondary industries the wage of the European is lower, and that of the native somewhat higher; the general ratio of native to European wages would appear to be roughly 1 to 5,¹ as compared with 1 to 8, or 1 to 6 (according to the value assigned to the additional charges) in the mines. In Europe the common ratio of skilled to unskilled wages is estimated at 7 to 5 in the building and engineering trades.

The policy which seeks to maintain separate standards of industrial remuneration is in its origin based on a distinction of social status and not of industrial skill. While it is clear that the great mass of native workers cannot be regarded as skilled, there are stages of industrial work in which the native would, if permitted, come into economic competition with the European; and though the various attempts made to assess the comparative value of European and native labour in this common field² cannot have any scientific accuracy, it would be just to say that, even in present conditions, the disparity in wages is clearly greater than is warranted by the difference in the capacity of the two classes. A recent official inquiry expressed the view that, even on the most favourable estimate of the superiority of European over native labour, an equivalent margin above prevailing native wages would be insufficient to make up for the generally accepted difference in standards of living between the two races.³ It is due in the main to the necessity which has been felt for making possible the maintenance of this social distinction that the Union has recognized the principle of the 'civilized labour policy'.

Apart, however, from the problems which such a policy would normally involve, the position has been complicated by the situation of the 'poor whites', or Europeans who are not qualified for skilled industrial employ. They are drawn largely from the *bywoner* class on the farms, who have migrated to the towns. The calculations which have been made of the numbers of those who may be held to fall within the category of 'poor whites' vary widely according to the definition adopted; the estimate made in

¹ *Report of the Industrial Legislation Commission*, 1935, p. 15.

² *Report of the Economic and Wage Commission*, 1925, p. 84; *Report of the Carnegie Commission on the Poor White Problem in South Africa*, 1932, part i, pp. 163, 179.

³ See *Report of the Industrial Legislation Commission*, 1935.

1916, which held the field for many years, indicated that there were 39,000 'indigent' and 67,500 'very poor'; the more recent investigations of the Carnegie Commission,¹ without pretending to an accurate enumeration, suggested that they might be considered to represent a population group of 220,000 persons. In a normal economy these persons would be in the ranks of unskilled labour. In South Africa, however, the accepted social philosophy precludes the acceptance by Europeans of the rates of wages which prevail in such employment, and it has been necessary for the government, in order to provide them with work at rates more nearly approaching those suitable to 'civilized' standards of living, to set on foot, either directly, or through local bodies, a large number of subsidized works,² as well as to institute a special service battalion, and also a pioneer battalion designed to give employment and industrial training to the younger men. The rates of pay given are intermediate between those of the standard wages of European labour and those of the native; there are no figures available of the total cost to the state of these measures, but the range of expenditure may be judged by the fact that in 1933 there were 30,200 Europeans employed on subsidized state relief works and special schemes, and 8,500 on subsidized municipal relief works. These numbers, however, include a certain proportion of unemployed skilled or clerical workers; and with improvement in industrial conditions some reduction has taken place. There were in 1936 some 12,500 men on state and municipal relief works and the same number on subsidized special works.

In addition to these measures, the principle of the 'civilized labour policy' has been employed to effect the substitution of European unskilled labour for native or coloured employees in state establishments, and local bodies have been required to employ a prescribed proportion of European labour in their regular services, being compensated by subsidies from the state for this purpose. The influence of the Labour Department is being utilized to secure the co-operation of private employers to the same end, with the result of a considerable displacement of 'coloured' and

¹ *Report*, op. cit., p. vii.

² For a list of works see the *Official Year Book*, 1937, op. cit., pp. 281-6.

native labour. The measures taken for the support of the poor whites are viewed in the Union as of a temporary nature, necessary only until the steps taken for their education and industrial training have fitted them to take their place in the ranks of skilled workers. But the problem of the poor white exercises a far-reaching influence on Union policy, and its effect may be observed not only in the government's attitude to questions of wage determination, but in measures for the promotion of the secondary industries. It is all the more marked, because the system of adult European suffrage gives this class a significant weight in the electorate. The 'civilized labour policy', in seeking to maintain the present level of European wages, is further served by the insertion of a wage clause into all government contracts, which exercises an extensive influence also over the scale of wages in private undertakings. It is also important to note that the Tariff Act is deliberately used to secure the employment of a specific ratio of European to native labour in certain protected industries.¹

Provision for the determination of wages is made by the Industrial Conciliation Act 11 of 1924 (as amended by Acts 24 of 1930 and 7 of 1933), which establishes machinery for giving legal effect to agreements between employers and organized bodies of labour, and to awards on arbitration; the Wage Act 27 of 1925 further provides that, after inquiry by a board appointed for the purpose, the Ministry may make a determination of a minimum wage in any branch of trade or industry. The former Act has been widely used, and has given a stimulus to the organization of associations and unions both by employers and employees; it has been of acknowledged value in reducing the number of industrial disputes. But it does not apply to agricultural labour, and since natives are not, save in very rare instances, admitted as members of European trade unions,² it has not operated in regard to the regulation of native wages. The board constituted under the Wage Act had by 1935 made recommendations which resulted in determinations in regard to fifteen branches of trade, mostly with local but in a few cases with general application throughout the Union, and a substantial rise of wages for a number of urban workers has followed.

¹ *Report of the Customs Tariff Commission, 1934-5, U.G. 5, 1936, para. 354.*

² See p. 688, below.

The scale of native wages is, as has already been stated, based on the assumption that the native can, if necessary, draw his subsistence from the land. It is, however, apparent that there is a growing proportion of natives who cannot maintain themselves within the restricted area of the reserves at the standards of life now prevailing; to them wage-earning has become a necessity, and in their case any scale is inadequate which is calculated on the 'male adult' and not the family basis. This class, however, is restricted in the possibility of improving its position by the fact that employers can still count on recruiting a considerable body of labour, partly in the Union but largely in outside areas, among natives who can find subsistence for their families on their own lands. The centralized system of management on the Rand mines, described elsewhere,¹ has succeeded in maintaining the scale of native pay in the mines at approximately the same rate for many years; the average for all underground labour was calculated by the Native Economic Commission² to be 2s. 0½d. per shift in 1914 and 2s. 2½d. per shift in 1930, and no increase in rates has since taken place. There were in the interval fluctuations in general price levels amounting to over 48 per cent. without any corresponding variation in the scale of native pay. It is not easy to calculate the precise relation of real wages in 1914 and 1930; but it is clear that the prices of many articles of native consumption, such as clothing, have risen; the general standard of native expenditure has increased, and European wages in the mines rose nearly 20 per cent. between 1914 and 1930. The European miner has also in recent years received large additional benefits in the nature of provision for pensions and holidays; in 1935 the fund established by the mines for this purpose amounted to over £1,000,000. Of 65,944 natives employed in secondary industries in 1932-3, 48.5 per cent. received an annual average wage of between £27 and £40, 44 per cent. were paid from £40 to £50, and 7.5 per cent. from £50 to £62. About 20,000 are employed on the railways at an average monthly wage of 63s. 2d. The rates of pay given to hired workers in rural areas vary greatly, and apart from the details given in the Native Economic Commission Report,³ largely based on the investiga-

¹ See Chap. XXII, p. 1488.

² *Report*, op. cit., para. 828.

³ Op. cit., pp. 132, 135 ff.

tions of Drs. C. H. Neveling and J. C. Neethling, no comprehensive statistics are available. The general wage of hired workers is shown to be on a lower basis than in the towns, the minimum quoted being 5s. a month with food, with a maximum (in very exceptional cases) of £3 a month, but to this must be added the value of the privileges usually allowed, such as land for cultivation or grazing. Labour tenants in some cases receive no cash wages.

Not only is the scale of native wages affected by competition from natives, residing both within and without the Union, whose families remain within their own subsistence economy, but the state supports the 'civilized labour policy' by legislative measures designed to prevent natives from entering into the higher grades of skilled employment, and thereby reducing the openings available to European labour. The economic aspect of these measures will be discussed elsewhere;¹ it is here sufficient to describe the more important of the measures directed to this end. One of the most conspicuous is that generally known by the name of the 'colour bar' law. The law is that embodied in the Mines and Works Amendment Act of 1926, which authorizes government to make regulations providing that certificates of competency in certain occupations shall be granted only to Europeans and certain classes of 'coloured' persons; in practice the regulations issued apply only to the grant of certificates of competency for certain operations in mining. The law was not in itself an innovation; there had from the first existed a customary colour bar in the mines. Its existence was recognized in the Transvaal Labour Importations Ordinance of 1904 and again in regulations framed under the Mines and Works Act of 1911, and the law of 1926 was passed as the result of a decision of the courts in 1923 that these regulations were *ultra vires*. Though, however, the operation of the legal colour bar is confined to the mines, the Trade Union system applies in practice a colour bar discrimination in most of the skilled trades. At the moment this operates as a restriction only on that small proportion of the native labour force which is qualified for entry into skilled employment; but it has a wider influence in depriving natives of the incentive to qualify themselves as 'skilled' workmen, and in maintaining the system

¹ See Chap. XX, p. 1369 ff.

under which native labour is as a whole remunerated at 'unskilled' rates. The apprenticeship system, as applied to certain trades,¹ by laying down standards which make it practically impossible for natives or the majority of coloured persons to enter into apprenticeship, further restricts the opportunities for non-Europeans to rise in the industrial scale. These measures are reinforced by the effect of the laws regulating the combination of labour in order to improve its conditions. The Industrial Conciliation Act, as has been shown, does not admit natives to its benefits; the specific exclusion is that of employees who are 'pass-bearing natives,' but in effect this excludes all natives outside the Cape.² While Europeans are allowed to strike after giving the notice prescribed in this Act, the Masters and Servants Act makes it an offence for natives under labour contract to withhold service without giving statutory notice of the termination of their contract. The Riotous Assemblies Amendment Act, 1930, can be, and has on occasion been used to remove persons interested in organizing unions of native labour; and the pass law regulations³ have been utilized to prevent their access to natives in the reserves. These obstacles have not entirely prevented the combination of natives, as the history of the well-known Industrial and Commercial Union (the 'I.C.U.') has shown. Founded in 1920, it was claimed by some of its leaders to have had a membership of over 100,000, though it is doubtful if these numbers were actually attained. Though it took a considerable part in labour troubles in 1921 and 1922, its membership was not confined to workers, and its character was rather that of a political association than of a labour union.⁴

The economic policy of Southern Rhodesia, like that of the Union, assumes a separation of labour into two classes based on a racial discrimination. As is shown by Professor H. Clay,⁵ the scale of European wages still reflects the conditions which made it

¹ By Act 26 of 1922 amended by Acts 15 of 1924 and 22 of 1930.

² See *Report of the Native Economic Commission*, 1930-2, Addendum, paras. 293 ff., and *Report of the Industrial Legislation Commission*, 1935, p. 69.

⁴ Dr. C. Leubuscher's book, *Der südafrikanische Eingeborene als Industriearbeiter und als Stadtbewohner* (1931), pp. 177 ff., gives a description of the development and character of the I.C.U. It also contains much useful material on the position of the native in South African industry.

⁵ *Report on Industrial Relations in Southern Rhodesia*, 1930.

necessary to attract skilled workers to a new country; they are in terms of money somewhat higher than in the Union, though in real wages the superiority is not so great. Thus, in 1930, it was calculated that in a selected class of occupations the money wages were about 25 per cent. higher than in the Union, but that the cost of living in Southern Rhodesia was about 15 per cent. higher. The number of European industrial employees or artisans is comparatively small; in the mines, for instance, the ratio is one European to twenty-one natives as against about one to eight in the Union. Though the money wages of European labour are higher than in the Union, the native wage is on a lower scale; in the mines, for instance, the average wage of native labour in 1935 was 20s. 1d. a month with food, the rate having been reduced from 28s. 2d. in 1930,¹ as compared to the all-round rate of 57s. 6d. in the Union; farm and road labour is paid on a scale which approximates to that of East Africa rather than of the Union. The gap, therefore, between 'skilled' and 'unskilled' standards is wider even than in South Africa. The lower rate of native wages has been accounted for in the past by the prohibition of the recruiting of natives for the Rand mines north of latitude 22. Even were that restriction entirely removed, the extra cost of travel to the Union would still operate to prevent a general southward migration in search of higher wages.² Moreover, the standard of native living is lower in Southern Rhodesia, in the sense that the demand for European goods is less developed; and the existing rate is sufficient to attract natives from territories farther north where the prevailing wages are even lower. Though the policy of Southern Rhodesia looks, like that of the Union, to the maintenance of conditions in which the native will not be able to invade the European field of employment,³ circumstances have not yet called for any legislative intervention in support of this principle. The poor white problem, which has been responsible for much of the action taken in South Africa for the support of the 'civilized labour' policy, has not assumed prominence in Southern Rhodesia; indeed, it is the avowed policy of the government to forestall its

¹ International Labour Office, *Industrial and Labour Information*, vol. lvii, 1936, p. 273.

² For the partial withdrawal of this restriction see above, p. 652.

³ See the Hon. G. M. Huggins, 'Southern Rhodesia' in *Eastern Africa To-day and To-morrow* (ed. F. S. Joelson), 1934, p. 349.

appearance; if, during the depression period, there was some poverty among Europeans, it was due only to temporary unemployment. No colour bar law has been passed, but agreements are made which mean that European labour is necessarily employed; an agreement of this type has, for instance, been made in connexion with the building trade. The Industrial Conciliation Act, 1934, contains a provision which enables the Minister to intervene if agreements seem likely to deprive natives of reasonable prospects of employment, but it is doubtful if this can be used to any effective purpose. Support is given to the employment of European labour in 'skilled' work by the terms of government contracts, and a convention excludes the use of natives on other than unskilled work on the railway.

The copperbelt mines of Northern Rhodesia afford the only example in British colonies of an organized industry which is in any way comparable with that of the Union, but the relation of European to native labour has not been subject to the influence of any such political or social theory as has produced the 'civilized labour' policy in South Africa. A considerable part of the white population engaged in industry is not permanently resident in the colony, and in the population as a whole the European stands only in a proportion of 1 to 120 natives. There has, as yet, been no problem of poverty among the Europeans comparable to that of the poor whites in South Africa; during the depression period it was necessary to deal with a number of destitute Europeans, 409 being repatriated in 1932 and 173 in 1933, but the numbers so treated fell to twenty-five in 1935. On the railway a strict colour bar prevails owing to Trade Union influence from Southern Rhodesia. The European workers in the mines are organized in a Union but, while an established convention regulates the respective fields of white and native work, it has not been embodied in any rule, nor has there been legislation of the type of the colour bar law. In 1935 the ratio of European to native labour at three of the principal copper mines was roughly 1 to 8, or approximately the same as in the Rand mines. No need has yet been felt for the passing of an Industrial Conciliation Act such as that of Southern Rhodesia. The scale of native pay in the mines reflects the fact that there is no difficulty in obtaining an adequate supply of indigenous

labour without recourse to recruiting; the 18,464 natives employed on an average each month in 1935 received an average wage of 23s. 6d. a month with food, the rate in the farming areas being 5s. to 10s. a month with food. It may be noted that though native wages are low, this would not seem to have been an important factor in causing the copperbelt disturbance of May 1935.¹

In none of the other British colonies is there a resident white population of a type which creates a problem in industrial employment, and there is accordingly no evidence of state intervention to maintain a 'civilized' scale of wages confined to Europeans, or to restrict the entry of natives or Asiatics into a field of employment held on social grounds to be reserved for white labour. Thus, to take a typical point, government policy in Tanganyika and Nigeria has led to the growing use of trained natives as engine drivers or stationmasters, and in the postal and telegraphic services. Nor again is any such policy apparent in the French territories; the current system of technical instruction seems designed to fit natives for any industrial employment of which they show themselves capable, and this is a marked feature of Belgian policy. The education given to the families of native workmen in the Katanga copper mines is preliminary to a system of apprenticeship designed to produce workmen capable of handling technical processes. The considerable reduction in the number of European employees in the *Union Minière* mines, which fell from 1,951 in the year 1930 to 591 in 1934, was mainly due to trade conditions, but with the revival of production every effort is being made to obviate the re-engagement of Europeans, by substituting native skilled labour. Natives operate almost entirely the electrical overhead trollies and haulage of trucks in the mines, and are employed as engine drivers and on other skilled work on the Congo railways.

IX. GENERAL CONCLUSIONS

In the remarks with which this chapter opened, the deficiency in the supply of labour was shown to have had a dominating influence over the earlier policy of the administrations in dealing

¹ *Report of the Commission on the Disturbances in the Copperbelt, Northern Rhodesia*, Cmd. 5009, 1935, pp. 85, 144.

with labour questions. In present circumstances, however, the problem has become one of local rather than of general importance. In the Union the increased activity of the Rand mines, involving the employment of a force of more than 300,000 men, creates a demand which can only be met by the use of an extensive organization for recruiting,¹ more than 48 per cent. of the supply being drawn from outside the Union. Complaints of the shortage of labour on the farms of the Transvaal and parts of Natal constantly recur in debates in the Union Parliament and continue to influence the attitude of the agricultural interests in regard to native policy. Recent developments in some territories have shown that a large expansion of industrial activities may result in a shortage, but this resembles more closely the shortage experienced by older industrialized countries in periods of trade revival than that which formerly arose in Africa from the natives' unwillingness to enter wage employment. The report of the recent committee in Tanganyika considers that with the elimination of waste there is ample man-power for the needs of the territory, both for wage-earning and in the growing of economic crops.² It should be noted that in the Rhodesias and in East Africa wages have not yet been raised much above the low level to which they were reduced during the economic depression. In the British West African colonies employers can now find sufficient labour without recourse to recruiting agencies. The most significant evidence of the change which has taken place lies in the growing substitution of short for long-term contracts; the short contract is now common in both Northern and Southern Rhodesia, and in the West African colonies the labour contract has almost ceased to exist. In the Belgian Congo, on the other hand, though the question of supply no longer causes the same difficulty as formerly, it still presents features which occupy the serious attention of the administration;³ in the French colonies it constitutes a difficulty only where new schemes of development, such as that of the Niger⁴ basin, necessitate the importation of settlers into a sparsely populated area.

All the evidence shows that the normal economic incentive to

¹ See above, pp. 651 ff.

² *Report of the Committee Appointed to consider and advise on Questions Relating to the Supply and Welfare of Native Labour in Tanganyika Territory*, 1938, p. 11.

⁴ See Chap. XV, p. 1049.

wage-earning is an influence of increasing strength; and it therefore becomes interesting to examine the conditions which seem to regulate the stimulus which it affords. In the circumstances of Africa the availability of labour for industrial or agricultural enterprise may be held to be determined by the presence at a convenient distance either of a population engaged in a purely subsistence economy or, alternatively, of one which is engaged in the production of crops for sale, but is of such density that a proportion remains without profitable employment. In the former case also the density of population is a factor of some importance; a nomadic pastoral people is, as experience shows, less ready to respond to the stimulus of wage-earning than one engaged in cultivation. The Masai and Zulu seem characteristically opposed to entering into employment; the attitude of the Masai to cattle as the most prized of all commodities has rendered them impervious to the attraction of European goods, while their herds provide them with an alternative source from which to meet their cash obligations; the tradition of the Zulus as a dominant warrior race makes them reluctant to accept the discipline of industrial labour, though they are not disinclined to enter domestic service. But facts do not support the popular belief that the 'collectivist' organization of African society implies the absence of those individual ambitions in the material sphere which are regarded as the mainspring of European economic development. Nor is there any substance in the belief that improvement in living conditions will reduce the supply of labour from areas under a subsistence economy; indeed, any improvement in standards of living is likely to increase the supply of labour from such areas, and better subsistence will enhance the physical capacity of the labourer. On the other hand, the extension of marketable production will, in its initial stages at all events, undoubtedly reduce the desire for entry into employment or, alternatively, create conditions in which the employer can only attract labour by offering a considerably enhanced wage. Given, for instance, the existing density of population in the cotton producing areas of Uganda or Tanganyika, or in the cocoa areas of the Gold Coast, it may be anticipated that industrial enterprise would have some difficulty in securing labourers from them, but there are, on the other hand, many areas where a population engaged in

marketing production is so congested that a surplus would seem to be available for industrial employ. The possible effect of the extension of marketing cultivation appears, therefore, to depend largely on local factors.

It is significant that the Tanganyika Committee recommend that wage-fixing machinery should be established. The Geneva Convention of 1928, concerning the creation of minimum wage-fixing machinery, has been ratified by Great Britain, France, and the Union of South Africa. Ordinances to empower the Governor to make rules or appoint wage-control bodies have been introduced in Kenya¹ and Uganda,² but action has not been taken on them. Legislation on this subject has not been introduced in the French colonies except that a minimum wage is laid down annually for labour in French Togo.³ In the Belgian Congo the provincial commissions for the supervision of labour conditions appointed under the ordinance of February 13, 1934, are required to deal with the question of wages. The Portuguese territories do not appear to have passed minimum wages legislation, but the native protection commissions in Moçambique are in principle charged with the supervision of wages. Governments seem to have concerned themselves in the initial stages with questions of general treatment rather than of wages, but it is not unreasonable to suppose that with improving standards of living, and with the growth of industrialization, action in this direction may become necessary.

Experience seems to justify another observation. The inducement offered by wage-earning must be viewed not merely in terms of wages but in relation to conditions of employment. In Europe the general conditions of unskilled labour are such that a difference of wage is likely, within certain limits, to be a decisive factor in attracting labour; in Africa other circumstances, such as the treatment given, the nature of the task, or the amount of liberty left to the worker, have an equal or, in some cases, even a greater importance. It is, for instance, generally accepted that the scale of diet and housing provided on the Rand mines gives employment there a definite attraction; nevertheless, farm labour, with its com-

¹ Ordinance 22 of 1932.

² *Rapport annuel du Togo, 1937.*

³ Ordinance 3 of 1934.

paratively low pay and inferior scale of diet has, owing to the privileges of grazing and cultivation offered, advantages which for many classes outweigh those of mine or urban labour. On the whole, therefore, no general forecast can be made of the extent to which wages may have to be improved in order to produce the labour necessary to meet future development; the problem must be viewed in each case in relation to the circumstances of the area from which labour is sought and the conditions of employment offered by the industry. There is another consideration of no little importance in this connexion. In the initial stages of industrial enterprise the question of labour supply was considered mainly in terms of numbers; though labourers from different areas may have given evidence of different mental and physical capacity, all were at the outset equally inexperienced in the type of work required. The traditional view of the African labourer as crude man-power, which could be suitably remunerated by a low and undifferentiated scale of pay, continued for long to influence employers, and it is only of recent years that they have recognized that an improvement in the efficiency of labour offers a possibility of effecting a reduction in the numbers required, and has an important bearing on the costs of production. The Tanganyika Committee of 1936-7, in advocating that the improvement of labour should take a prominent place in the programme of employers, suggests the increased use of machinery and the elimination of manual work as far as possible.¹ In the Union, social policy, overriding considerations of a purely economic nature, still confines the native to the field of unskilled employment, and this fact must reduce the stimulus which normally operates to make unskilled labour seek to improve its own capacity. The Union policy in regard to the land has also had an important influence on the quality of farm labour; the prohibition of renting land to a native on a cash or produce basis tends to deprive his labour of educative value in so far that it deprives him of interest in its output. Policy in the British Crown colonies takes a different direction. Technical education is being extended, and there is a growing use of the native in 'skilled' and technical work. This is even more marked in the Belgian Congo,² where

¹ *Report*, op. cit., 1938, p. 11.

² See above, p. 692.

industrial policy would seem designed to effect the substitution, wherever possible, of trained African labour for the European workman.

In the improvement of the efficiency of labour there is another factor of importance. Experience has shown that efficiency is closely linked with health conditions, and the more important organizations have now adopted, with satisfactory results, the practice of giving a period of 'acclimatization' by medical treatment and dieting before the recruit begins active work. This has been rendered compulsory in certain industries in the Belgian Congo. Reference has already been made to the study given to the question of dieting and health conditions in the Rand mines, the Northern Rhodesia copper-mines, and the major Belgian enterprises; but there are many instances where this consideration has been neglected by employers and has received inadequate attention from the state. The Tanganyika Committee emphasizes the wastage of labour due to ill health and the need for increased attention to dieting and health in the industries in that country.¹ The problem has, however, wider implications for, as has been recognized in the study made by the Belgian Labour Commissions, the solution lies not merely in attention to the health conditions of employed labour, but in intensive medical work and the promotion of improved standards of subsistence cultivation in the areas from which labour is drawn. In South Africa, the Director of Public Health drew attention in 1934 to the relation between the poor health standards of the natives and labour deficiency; the prevalence of diseases due to malnutrition is reflected in the high proportion of men who are rejected on medical grounds for work in the mines, a factor that partly accounts for the Union's partial dependence on immigrant labour. Of a group of 500 applicants specially examined in Bechuanaland in 1933, no less than 41·4 per cent. were rejected and 8·6 per cent. considered doubtful by the medical officers of the Native Recruiting Corporation. Again, the increased use of machinery could undoubtedly improve the value of the existing labour supply by using it more economically.²

¹ *Report*, p. 28.

² *Report of the Committee Appointed to consider and Advise on the Supply and Welfare of Native Labour in the Tanganyika Territory*, 1938, p. 11.

The problems of labour, however, cannot be considered only in the light of the need experienced by employers for a larger and more efficient supply of workers. The state has its own social duty to perform in improving the conditions of employment. It has been shown that natives are to a great extent debarred from forming unions to protect their interests, and legislation makes it an offence for contract natives to strike or to withhold their services without giving notice of the termination of their contracts. It may be questioned whether African workers are in general sufficiently advanced in capacity for organization to form effective trade unions, or whether, in territories where the state has assumed a full responsibility for their working conditions, such unions can serve any useful purpose. Experience has shown, however, that some collective means for the ventilation of grievances which may otherwise remain unknown to the authorities until disorders break out, is desirable. Political or social policy may operate in South Africa to prevent the entry of the native into skilled employment or may limit the interest which he can acquire in the land, but there is nothing in that policy which should prevent state intervention for the benefit of the native in such matters as the improvement of the housing conditions in urban areas or the regulation of the scale of pay given to farm workers. There are, again, some features of the pass laws¹ and of the Masters and Servants Acts, or of the administration of the recruiting system, which urgently require improvement. In the British colonies there is a need for the more systematic regulation of welfare conditions and their safeguarding by the provision of an inspectorate.² In the Belgian Congo there appears to be some evidence of the continuance, despite official condemnation, of the system which permits administrative officers to interest themselves in recruiting for private employers; and the allegations made with regard to recruiting operations in Portuguese territories have been mentioned. These are typical instances, but they are matters which lie within the normal sphere of administrative obligation, and with the advance in standards of good government it is reasonable to hope that they will receive the attention which they demand.

¹ See above, pp. 664 ff.

² See above, p. 677.

The disintegration of social life is an almost inevitable result of the contact of primitive peoples with European civilization, and every consideration dictates the need for avoiding the undue disturbance of their existing social equilibrium if we are to be able to assist them to adjust themselves in a healthy manner to the new social and economic systems thrust upon them. In studying this question we must, however, distinguish those results which can be directly attributed to the introduction of capitalist enterprise from those which must in any case have followed from the impact of European civilization on the more primitive conditions of Africa. The latter falls within the field of sociological inquiry proper; here we must limit ourselves to a study of the most characteristic results which have followed directly from the introduction of capitalist enterprise—namely, the depopulation of certain areas or the deterioration of local subsistence conditions owing to the migration of labour, the social evils due to the removal from their families of large numbers of adult males, and the difficult situations created by the aggregation of industrial populations divorced from the traditional controls of tribal life.

The periodic migration of labour occurs in nearly every African territory, though its results are not equally felt. There is a migration of agricultural labour even in those areas where native production has formed the chief line of development; labour moves, for instance, into the southern areas of the Gold Coast and the Cameroons, or, again, into Uganda or the districts of Tanganyika bordering on Lake Victoria. The movement to the farms and plantations in East Africa is of importance; it is, however, of a particular character; the place of employment is often in the vicinity of the native areas from which labour is drawn, and the labourer remains in contact with his own people; in any case, agricultural occupations seldom involve so complete a change of environment as employment in industry. It is the employment in the mines, and especially in those which draw their labour from a distance and secure it under contracts involving a considerable period of absence, which accounts for that form of migration which has the most significant effects. In estimating the extent of migration of this type it is necessary to rely for the most part on the official figures showing the proportion of 'foreign' labour employed

in each country; it must be noted, however, that migration which takes place across a political frontier does not necessarily mean that the journey is longer than many that are made by natives in search of work within the boundaries of a single territory. There are cases—as, for instance, the Lupa gold-fields—where employment centres are more accessible to populations across the frontier than to residents under the same administration.

The most conspicuous migration is to the Union, which, as has been shown, is largely dependent on 'foreign' labour; the mines in 1936 drew 183,851 of their native employees from sources within the Union, 49,582 from Basutoland, 7,521 from Bechuanaland, 7,316 from Swaziland, 89,104 from Portuguese territory, and 3,833 from other territories. In spite, however, of the large numbers drawn from outside, the effect of the industrial demand on the population of the Union itself is more marked than in any other territory. The tax returns for a number of areas in 1928 and 1929 showed that over 60 per cent. of the taxpayers were absent;¹ a Transkei magistrate stated in 1931 that 10 per cent. of the total population of his district was permanently absent at work; in the Herschel district it was estimated, as the result of an investigation made in 1930, that 75 per cent. of all adult males were away six months every year.² The effect is also strongly marked in the High Commission Territories. In Basutoland the average proportion of adult males absent has been calculated at 50 per cent.; in one district of Swaziland 8 per cent. of the taxpayers are stated to have been absent more than four years.³ A study made of the Bakxatla tribe of Bechuanaland placed the proportion of adult males employed outside the territory at 40 per cent., and of these 5 per cent. were not expected to return.⁴ Though the material available is admittedly inconclusive, it has been estimated that the annual labour exodus from Swaziland affects some 10,000 out of an adult population of 26,000, from Bechuanaland some 7,000 out of one of roughly 40,000, and from Basutoland some 60,000 out of one

of 120,000,¹ and though no calculation is possible of the average time for which they are absent, it is clear that those engaged in the mines are not absent for less than a year, the average period of actual service being eleven months.

Southern Rhodesia is, as has been shown, largely dependent on immigrant labour; the mines in 1936 employed 60,397 natives from outside the territory as against 23,659 from inside, and other employments absorbed 73,361 foreign labourers against 63,993 local. The exodus from the local native reserves is far less general than in South Africa, though it was noticeable in particular areas before the depression. It was estimated in Ndanga District in 1929 that fully 80 per cent. of the able-bodied men were absent for an average period of nine months in the year, but this, if correct, would seem to be an exceptional case. Northern Rhodesia is an exporter of labour; 53,462 natives were estimated in 1936 to be employed inside the territory and 51,212 outside.² The fact that labour in the copperbelt has become to a certain extent stabilized has only reduced in a minor degree the movement of labour within the territory; it is very marked in certain areas; in the Eastern Province some 15,600 out of a taxable population of fewer than 50,000 were estimated to be away at work at any one time. An increasing tendency for boys under 18 to leave home has been noticed.

The migration of labour has for many years formed the dominant problem of Nyasaland, and the recent inquiry of the local committee on emigrant labour provides fuller material regarding its effect on the population than is available elsewhere. Though until recently the recruiting of labour from the Protectorate was prohibited, and it is still illegal to cross its boundaries without a pass, these measures have been ineffective, and there is an exodus of significant proportions. In 1935 it was estimated that out of a total male population of 750,000 some 120,000 were in employment abroad; 75,000 were working in Southern Rhodesia, of whom 24,300 were at the mines, and the total believed to be employed in Tanganyika was about 20,000, of whom 15,000 were at the gold-mines. In 1934 the estimated percentage of taxpayers absent from Mzimba District was 65; from West Nyasa, 60; from

¹ International Labour Conference, *The Recruiting of Labour in Colonies*, 1935, p. 36.

² See above, p. 606.

North Nyasa, probably 50; and it was believed that as many as 25 to 30 per cent. were unlikely to return to their homes. In Tanganyika the labour in the gold-fields is, as has been shown, largely immigrant, but much of that employed on the plantations is drawn from long distances within the territory and is absent for considerable periods. In Kenya there is little migration of the type characteristic of areas farther south, but there is a considerable exodus from certain of the reserves for local employment on the coffee and sisal estates. It was estimated in 1933 that the Kikuyu of Kyambu district sent an average of 62 per cent. of their able-bodied male population, the Nandi 74 per cent., the Lumbwa of Kericho 43 per cent., and the North Kavirondo 38 per cent. to work for various periods on farms and plantations. In Uganda the movement of labour is for the most part confined to seasonal employment in the cotton fields. In the British West African colonies the movement is also mainly seasonal and for agricultural purposes; from the Northern Territories of the Gold Coast, however, there may be said to be migration of the type familiar elsewhere, and it is noteworthy that though much of the labour goes to the gold-mines on short-term agreements, the period of absence probably averages about a year. There is also a fair amount of migration from French territory to plantations in the Gold Coast Colony and the British Cameroons.

In the Belgian Congo the number of natives required in European undertakings rose from 45,702 in 1916 to 409,665 in 1930; this created at one time a serious problem of migration, and was one of the main reasons which led the Belgian Government to appoint the Labour Commission to which reference has already been made.¹ The period of depression led to a marked decrease in the demand for labour, and the situation in regard to migration has been further eased by the adoption of the policy of 'stabilization'.² The Katanga copper mines at one time drew more than half their labour from the Bemba of Northern Rhodesia, but have now almost ceased to recruit from this source, and it was announced in 1932 that they had also ceased recruiting in Ruanda-Urundi, though they still seem to employ a certain number of men from

¹ See above, p. 647.

² See Chap. IX, pp. 523 ff.

that area.¹ The Kilo-Moto and some other gold mines recruit from the Congo, but in some cases from areas at considerable distances from the mines; here, also, some measure of stabilization has been adopted. Though, however, the problem of migration is no longer of the same magnitude, it is clear that with any improvement in markets it may again present difficulties. In the French territories the distribution of the population in relation to the demand for labour has been responsible for a certain measure of migration; thus in French West Africa the greatest density lies in the region of the Upper Volta, whereas the requirements for labour have mostly been in the plantations of the Ivory Coast; in Equatorial Africa the forest concessions in the Gabon have made a demand which the sparse population, averaging not more than 1.4 per square kilometre, has been unable to supply. In 1929 the total number of workers employed on forestry undertakings in the Gabon was 25,000, of whom 17,000 came from inland districts; the numbers employed have, however, since been greatly reduced. The experiment of transplanting whole native villages to the Gabon does not appear to have met with success. The extent of the annual migration from Portuguese territories is given by the figures of recruitment for South Africa and Southern Rhodesia, to which reference has already been made;² it clearly constitutes a heavy drain on the man-power of the areas from which it is drawn.

It would, therefore, appear that the most conspicuous effects of labour emigration will be found in South Africa, the High Commission Territories, Northern Rhodesia, and Nyasaland; Kenya has a problem, but of a more local nature. No demographic study has been made in these territories which shows the actual result of emigration on the vital statistics of the population affected. It is probably true that there are areas in which the normal increase of the population has been affected; there must indeed have been cases of decrease, but definite figures are lacking to support this assumption. It may again be reasonably assumed that in many cases the absence of adult workers has resulted in a reduction in the cultivation of subsistence crops, and though no agricultural

¹ League of Nations Permanent Mandates Commission, *Minutes of the Twenty-Second Session*, p. 248.

² See above, pp. 700-1.

statistics can be quoted in proof of this it has been stated as a fact by more than one observer. Thus the Chief Native Commissioner of Southern Rhodesia reported in 1926 that in reserves admittedly overcrowded three-quarters of the cultivable land was untilled for want of man-power, and the report¹ of the Native Economic Commission contains statements to the same effect. It has been suggested, on the other hand, by Dr. J. F. W. Grosskopf,² that this effect of labour emigration can be over-emphasized, since the bulk of agricultural work is in any case carried on by women; but this view seems to overlook the fact that in every native community the male has specific tasks which cannot be delegated to women. These are particularly important in areas where the practice of shifting cultivation prevails, and large trees have to be cut down before fallow ground can be planted. In South Africa particularly the growing substitution of the hoe by the plough has also increased the importance of the male worker in cultivation. The loss in production might be balanced by the gain to the community from the wages earned by absentees if an adequate proportion of the latter were brought home, but, as was shown in Nyasaland,³ this is not always the case. As Professor S. H. Frankel⁴ has noted, the prevailing low wage rates do not enable the migrant workers to accumulate sufficient capital to permit a reorganization of the basic economic activities in the village that would compensate for the men's absence. Of the social effects of emigration it is possible to speak more definitely. The Commission on Closer Union in East Africa⁵ was impressed with the gravity of the situation that would arise if the absence of natives from the reserves were such as to interfere with the continuance of native family and tribal life. A comprehensive study of this question is still lacking, but the report of the Nyasaland Committee on Emigrant Labour, 1936, contains authoritative evidence of the effect of emigration from Nyasaland on the dislocation of family life, the general relaxation of the moral code, and

¹ Op. cit., p. 213.

⁵ *Report*, Cmd. 3234, 1929, p. 67.

the disregard of the traditional sanctions which regulate behaviour.

In the French areas the chief effects of labour emigration will be found in the Upper Volta area of French West Africa and in certain parts of Equatorial Africa; the scheme of settlement involved by the development of the Niger basin¹ has not yet caused any large displacement of populations. Though, as will be shown,² the French Government has recognized the need for measures to prevent the effects of over-recruitment from particular areas, no demographic study appears to have been made of its effects on the population. Belgium, on the other hand, made a notable contribution to the subject in the proceedings of the Belgian Labour Commission of 1925 and 1928 and the inquiries held in 1930 and 1931. The situation with which these inquiries dealt was largely the outcome of somewhat unusual conditions; the construction of railways and roads had involved the use of compulsion on a considerable scale, and industrial expansion had created a sudden demand for labour in sparsely populated areas, with the result that large bodies of men, often recruited by the aid of official pressure, were transported long distances from their homes. The consequences, both in the 'depopulation' of certain areas and the reduction in production of local food supplies, were obvious.³ The commission pointed to the grave danger of a lower birth-rate and increased death-rate, which would destroy the social equilibrium of the communities concerned. It also called attention to consequences which were likely to occur even under more normal conditions, in the general demoralization of family life and, in particular, the spread of venereal diseases, and the probability that young women unable to marry at home would be lured to industrial centres by the gains of prostitution.

If some of the consequences of labour emigration still await the scientific analysis which only a comprehensive inquiry can provide, the general results are sufficiently recognizable to demand consideration of the extent to which they are preventable. Two lines of policy suggest themselves. It may, in the first place, be

¹ See Chap. XV, p. 1049.

² See below, p. 708.

³ See P. Ryckmans, *Le problème de la main-d'œuvre au Congo belge, province du Congo-Kasai*, 1931, pp. 54 ff.

asked whether the circumstances of Africa do not justify a deliberate choice between the fostering of native production and the extension of industrial and capitalistic enterprise. A question so general, however, cannot be discussed with the hope of arriving at any definite conclusion. It would be difficult to find agreement as to the weight to be attached to the factors, economic on the one side and social on the other, which seem to be involved; the views entertained would be coloured by judgements of the value of native institutions as diverse as those which are, for instance, current in Nigeria and the Union of South Africa. Moreover, the two lines of development are not necessarily antagonistic; they may often be complementary, and it is only in certain special conditions that they may come into conflict. While, therefore, a general discussion of this nature may be of some interest, in particular as serving to point to the need for the co-ordination of administrative and economic policy, a matter to which some governments have hitherto paid inadequate attention, the decision must in each case depend on local circumstances rather than on general principles.

More importance attaches to the results of the policy which accepts as inevitable many of the implications of the demand for industrial labour, but seeks to mitigate its consequences by regulating the extent of recruitment from particular areas and by improving the general conditions of life in the localities from which it is carried out. Equal interest has not, however, always attached to both aspects of this policy; though, for example, the improvement in the conditions of the reserves or other areas from which native labour comes is an accepted principle of British policy which has received increasing recognition in practice, little consideration has been paid to the question of the restriction of emigration from the areas most seriously affected. It is natural that such measures should not be envisaged as part of the Union system; the fact must now be accepted that the majority of the native population has become dependent on wage-earning, and, as the International Labour Conference of 1935¹ recognized, it is impracticable to introduce restrictive measures where the employment as wage-earners of a high proportion of the population has become an indispensable feature of the economic organization. The current

¹ *Report*, op. cit., part ii.

political philosophy of the Union appears to regard the movement of labour to and from the industrial centres as a civilizing influence which need not cause any material dislocation of native customary life.¹ The reserves constitute in this theory a reservoir of man-power of which the fullest use must be made in the interests of industrial development, but it is proper to add that an increasing recognition has of recent years been given to the necessity of improving the material condition of their residents.² The official attitude in regard to emigration from the High Commission Territories has been substantially the same as that in the Union. In Southern Rhodesia and Kenya attention has concentrated mainly on the improvement of conditions in the reserves, and there has been no systematic attempt to regulate the extent of recruiting.

The situation in Nyasaland, as already explained, presents a problem of peculiar difficulty; the consequences of emigration are recognized, but the prohibition of recruiting for employment outside the territory has failed to prevent a voluntary exodus of unusual proportions. The measures for the stricter control of emigration recommended by the Nyasaland Committee on Emigrant Labour³ would require the co-operation of other administrations which now benefit by the emigration; even if they so far subordinated their own interests, the agencies at their command are hardly adequate to make control effective. Some measure of co-operation has been obtained through the agreement with Northern and Southern Rhodesia, but the basic fact remains, that the economic condition of the Protectorate is such as to give labour a preference for external employment, and the only effective solution must lie in an internal development which will provide an equivalent source of employment within the Protectorate. Tanganyika has taken steps to limit recruiting in certain districts by orders issued in 1929, 1930, and 1931, and administrative orders restrict the making of contracts during the planting season. It is noteworthy also that certain districts have been closed to the grant of concessions for plantations, though this is an outcome of land rather than of labour policy.

¹ General J. C. Smuts, *Africa and Some World Problems*, 1930, p. 99.

² See above, p. 608.

³ *Report*, op. cit., part ii.

The French Government, in its general instructions issued in 1931 concerning public works financed from the Colonial Development Loan sanctioned in that year, called attention to the necessity for taking account of the 'demographic protection' of the communities from which workers were to be drawn. They indicated that the proportions taken for public works should not, in principle, exceed 50 per cent. of able-bodied males, but while they recognized the necessity for leaving a supply of labour for private employ they did not attempt to regulate the extent of migration.¹ Neither these directions nor the local regulations in force in French West Africa, such as those of 1926, referred to on page 644, fix a definite limit to the numbers who may be employed. Emigration has not, however, presented a problem of importance in French West Africa; it has created greater difficulty in French Equatorial Africa, where the extent of recruitment was regulated by a series of *arrêtés* commencing with that of February 18, 1921, referring primarily to recruitment of labour for the Gabon forest concessions. They originally fixed the proportion of men who might be engaged in the colony at one-third of the total male population, but this general direction clearly had no practical value, and in 1929 the principle was adopted of limiting the number of recruited workers to 4,000, the figure being progressively reduced in subsequent years. In the Portuguese colonies the Native Labour Code gives the Governor authority to prohibit temporarily the recruitment of labour from particular areas, but no information is available as to the extent to which this power is exercised. The Belgian Congo in following the recommendations of its Labour Commission has gone further in a considered policy of control than any other territory. The 'zoning' of districts available for industrial exploitation, the closing to recruitment of areas of low population or impaired health conditions, the fixing of a permissible percentage in each unit, and the progressive 'stabilization' of labour in the major industrial centres are parts of a comprehensive policy directed to obviating the mischief of excessive migration.

Though the details of the Belgian system may not be capable of

¹ Ministère des Colonies, *Inspection Générale du Service de Santé, Instructions relatives à l'établissement des prévisions d'emploi des crédits sanitaires supplémentaires des emprunts coloniaux*, 1931.

general application, its principles commend themselves as worthy of close study. It represents the first attempt to subject the movement of labour to systematic regulation in the interests of native society. Nevertheless, it does not provide as complete a remedy for the difficulties created by migration as has sometimes been supposed. In the first place, no restriction is placed on the number of natives who set out independently in search of work; the limitation applies only to those engaged by recruiting agents. In the second, it must be remembered that any limitation is likely to prove unenforceable in areas where the tax has to be provided by wage-earning. Even by following the logical course of accompanying the imposition of a quota by the remission of taxation, it is doubtful whether the spreading desire for European goods would not still tempt many natives to evade the restrictions. A complete solution of the problem, therefore, involves both a reduction of tax in depopulated regions and the provision of alternative sources of cash income, either through the encouragement of native production or the establishment of European plantations close to tribal areas. The latter is one of the courses advocated by the Nyasaland Emigrant Labour Committee. It must be remembered, however, that this can only be a satisfactory remedy if it does not involve the curtailment of the land available for native subsistence, and that it may result in the creation of vested interests which will later oppose the encouragement of independent native production.

There is a further range of problems still to be considered relating to the responsibility of the state for the provision of social services for the wage-earning class. The situation presents features essentially different from those of Europe. There the development of wage labour has generally involved the permanent concentration of the workers at the place of employment, and this has carried certain necessary consequences; the dependence of the worker on his wage as his sole source of income; a continuity of residence which means that the new centres grow into organized wholes; and the recognition that the growth of these urban populations imposes on the community certain responsibilities towards the wage labourer in the form of provision for social services and, most important of all, the maintenance of that section which is

deprived of employment by fluctuations in trade. In Africa the organization of wage labour has proceeded on the assumption that, except where farms are worked by squatter labour, the homes of the labourers will continue to be in the native areas, and that responsibility towards them will be discharged if they are remunerated at rates suitable to the single man and are adequately fed and housed in their temporary place of employment. Many of the social responsibilities which are undertaken by a modern European state could not, in any case, have a place in an industrial population consisting mainly of adult males.

It is clear that by treating the native reserves as reservoirs of man-power there is, in effect, a saving in that outlay on social services which in other circumstances might have to be incurred on behalf of industrialized labour, a fact which may be taken as reinforcing the claim for expenditure on the improvement of the reserves.¹ But even if that claim is satisfied there still remain certain social responsibilities towards labour in the industrialized centres which demand consideration. Such labour may for the present purpose be viewed in three classes. First, that which normally returns to its home on the conclusion of each period of contract service, and may, therefore, be regarded as only temporarily resident in an industrial centre. These workers are very rarely accompanied by their families; thus, in the Rand mines, which are an outstanding example of employment of this nature, there are only 1,518 native married quarters. Secondly, there are the workers employed in 'stabilized' centres, of whom a considerable number bring their families with them; the labour is housed by the management and lives under its control; it may continue in work for many years, but in the end it generally returns to its home on the termination of employment. Thirdly, there is the labour which, whether employed in secondary industries or in other urban occupations, with or without dependents, lives in 'locations' at or near the centre of employ, in which housing is neither provided nor controlled by the employer.

In regard to labour of the first two classes, expenditure on welfare conditions is the concern of the employer; the state has, however, the responsibility for the administration of justice in cases

¹ See above, p. 608.

arising between the employees, particularly in marital or similar matters. This question is discussed in Chapters VII and XX, and it will be seen that the problems which it raises are by no means simple. How far labour so employed becomes 'detribalized' is open to doubt; as has already been remarked,¹ the term itself is one of very variable interpretation. It will be realized that even in the 'stabilized' centres the workers do not necessarily become permanent residents of a self-contained community; they retain contact with the tribe and a majority pass back to it on the termination of their service. The question of the civil law to be made applicable to this class of labourers is one of peculiar difficulty; in the absence of a tribal court it is not easy to apply the worker's own customary law; to subject him to non-tribal or European law hastens the process of his 'detribalization'. There is another point of some importance in regard to the 'stabilized' centre. Purely temporary labour can, in the event of a reduction in numbers owing to trade fluctuations, be re-absorbed in the tribal 'reservoir', but in the event of unemployment in the 'stabilized' centres great hardship can result, as the experience of the copper-belt during the period of depression showed. The successful establishment of 'stabilized' conditions appears to imply some obligation for providing for the occurrence of periods of unemployment. The state has a larger range of responsibility in regard to labour of the third class, the permanent residents of the 'locations' and urban centres. Details have been given above² of the estimated strength of the population of this class and an indication of the social problems to which it gives rise; they are problems which in certain areas have clearly received inadequate consideration. The urban native location cannot in effect be regarded merely as a temporary prolongation of the reserve; it is increasingly obvious that it is an essential feature in conditions of industrial development. Industries depend on the existence of a supply of relatively low-priced native labour; the contribution which the workers make to industry, and through it to the financial prosperity of the country, carries an equivalent obligation for a recognition by the community of its social responsibilities towards them.

CHAPTER XII

THE STATE AND THE LAND

THERE is no matter in which colonial policy expresses itself so conspicuously as in the use which administrations make of their powers in regard to land, and certainly there is no question which has influenced more critically the attitude of Africans towards the governing power. 'On the manner in which this is conducted', Lord Durham said, 'all else depends.'¹ Up till now the public which interests itself in African affairs has concerned itself chiefly with the action of the colonial powers in assuming rights to alienate native lands or to control the use made of them by native right holders. In some measure this may now be regarded as a chapter in colonial history to which circumstances are tending to give a less important place than it once occupied, but it is not possible to appreciate the position to-day without examining the stages which have led up to it. It is proposed in the present section to deal with this aspect of the land question; a subsequent section will deal with other features which are now of growing importance to the administrations—namely, the changes taking place in traditional African tenures, the problems connected with the determination and record of title, the growth of transferable interests in land, and its use as security for credit and the like.

I. A COMPARISON OF COLONIAL LAND POLICIES

(a) *Introduction*

The study made in the present section must necessarily confine itself to the manner in which colonial powers have exercised their sovereignty; the methods by which this has been acquired, whether through conquest, treaty, or the less formal processes of tacit agreement, will come under discussion only in so far as they may bear on the rights now assumed by the states concerned. No

¹ *Lord Durham's Report on the Affairs of British North America*, edited by Sir C. P. Lucas, 1912, pp. 203, 242.

comparative study appears to have been made of the various ways in which European powers have treated the claims of native populations to rights over land in Africa and elsewhere, and here it is only possible to refer to certain typical cases. In all earlier colonial history, policy was determined primarily by the physical character and economic possibilities of the territory coming under control rather than by consideration of the rights which might be held by natives; areas held to be suitable for European settlement were everywhere liable to expropriation for that purpose, and those which, for climatic reasons, or because they were already fully occupied by native cultivators, were not so suitable, were liable to be subjected to various systems of control designed to place Europeans in a position to exploit their production. It was only at a later stage that the recognition of native rights became a question of policy, and even at this stage the acknowledgement of such rights seems to have owed much to economic considerations, such as the possible benefit to the colonial power of encouraging peasant production as compared with plantations or other forms of capitalist enterprise. Only in relatively recent times can native rights in land be said to have been considered on a purely legal basis.

It is of some interest to note the extent to which the treatment of land rights in Africa resembles that which has occurred elsewhere. The settlement of farms in South Africa had its parallel in the history of colonization in America; there the Crown at the outset assumed the right to give to settlers full proprietorship, and they proceeded to occupy lands without any consideration of Indian claims. After the initial period of forcible occupation, a rule of law gradually established itself in the British provinces of America by which, while the ultimate fee was in the Crown and its grantees, Indians were protected in the possession of such lands as had been left to them or reserved for them, though the Crown still retained to itself the right of transfer or removal.¹ In Canada the Crown at an early date assumed the right to reserve certain areas exclusively to Indians in territories acquired by treaties of cession. The Privy Council, in 1888, held that under the Proclamation of

¹ M. F. Lindley, *The Acquisition and Government of Backward Territory in International Law*, 1926, p. 339.

1768 the tenure of the Indians was a 'personal and usufructuary right dependent on the goodwill of the sovereign'. New Zealand presents a case in which the general policy of occupation for European settlement had to yield to organized native opposition; the British encountered recognized sovereignties with which to treat, and the Treaty of Waitangi in 1840 guaranteed to chiefs and tribes the full, exclusive, and undisturbed possession of the lands left in their occupation, subject to the Crown's exclusive right of pre-emption. The history of land policy in Fiji presents features of another type, to which some parallel exists in West Africa; the cession instrument of 1874 vested the proprietorship of all lands in the Crown, except such as had already become the bona fide property of Europeans or were in the use or occupation of some tribe or required for its future support. The Land Commission of 1883, however, reported on inquiry that the whole of the land in Fiji was in fact owned by the various tribes.

The land history of British India is of interest, for though it has no precise parallel in Africa, it throws light on some of the problems which are now beginning to emerge there. The pre-Moslem tradition claimed the ownership of land for the state, but in practice this meant only the right of the state to take a share of the produce. This system was dictated by economic circumstances, for where there is a large and stable population on the land, control tends inevitably to take this form rather than that of a claim to the land itself. This is a rule of general application; its operation will be seen in a comparison of the different measures adopted in the well-populated lands of West Africa and the more thinly occupied regions of the south and east. The Moguls made the principle of state ownership the basis of a fully developed system of land taxation, and under their rule there arose a generally recognized right of individual occupation which had most of the aspects of freehold, since it was limited only by the ultimate right of the state (or its fief holders) to dispossess those who did not pay the charges assessed on the land.¹ The British, having little interest as colonists, concerned themselves mainly with the revenue from the land, and made no claim to exercise rights of disposal over any areas on which individual rights could be shown to

¹ W. H. Moreland, *The Agrarian System of Moslem India*, 1929.

exist; 'state' lands are to-day only those which, like the large forest areas, were recognized in pre-British times as reserved for state or administrative purposes, or those which, in the elaborate process of survey conducted under British rule, have been shown to carry no private rights, or, finally, those acquired by purchase for public uses. In British India, out of a total area of 564,135,025 acres only 158,956,761 acres are now recorded as owned by the state. The comparatively small areas alienated by the state to non-natives for tea or coffee plantations or the like have formed part of the lands recognized from the first as forest or other state property.

The British India Government has not used its powers to enforce any system of compulsory cultivation such as that of the 'cultuurstelsel' of the Dutch East Indies, to which reference will presently be made. With the extension of systems of survey and registration of title practically the whole of the land in India is now held in individual title, and it is of interest to note the results as shown by the analysis of the agricultural population contained in the census figures of 1931. There were 3,257,391 non-cultivating owners, 27,006,100 cultivating owners, 34,173,904 cultivating tenants, and 31,480,219 persons recorded as agricultural labourers. Circumstances have not arisen which have made it necessary to pass legislation restricting the power of alienation by natives to non-natives. Private acquisitions by the latter have been small and were never on a scale sufficient to cause social disturbance; the only case which has attracted attention has been the private acquisition by Europeans of estates in Bihar for the growing of indigo. In a large part of India mineral rights follow surface rights and remain with the native holders of the land; in the more newly acquired provinces the state has utilized its position as 'ultimate owner' to claim the mineral rights for itself. The land problems of India to-day arise from the necessity of legislative intervention to adjust the relations of Indian landlords and tenants, or to correct the effects which an unrestricted power of obtaining credit based on land is producing in the social and agricultural economy.¹ These are problems of a type with which some African administrations may also become familiar in the near future.

¹ See below, p. 872.

There is also much in the treatment of land rights in the Dutch East Indies which is of interest in considering the land history of Africa. The Dutch East India Company proceeded on the assumption that the state is the ultimate owner or over-proprietor of the land, but this did not in practice operate as a restriction on private ownership otherwise than to necessitate compliance with certain formalities in land transactions. The principle of over-proprietorship, however, formed the legal basis of the so-called 'cultuurstelsel' which for many years distinguished the economic system of the Dutch East Indies, and the history of which is of interest in view of the use of the practice of 'compulsory cultivation' in different territories in Africa.¹ The system, designed to secure the production of export crops, was introduced in 1830.² Each village was obliged to set aside one-fifth of its lands for production for the European markets, under the direction of the native chiefs, who were subject to the supervision of European officials. The success achieved in the cultivation of indigo and sugar was followed by the extension of the system to tea, coffee, tobacco, cotton, and other crops, and the original limit of one-fifth was in practice extended to include one-third, one-half, and sometimes the whole of the arable. At the outset land so set aside was free of rent, but subsequently land rents were also exacted from the peasants engaged in 'cultuurdienst'. The government made large profits from its exports, but rice production fell, and the continuous rise in the price of foodstuffs added to the hardships in which the system involved the cultivators. Liberal opinion in Holland moved against the system, and from 1854 onwards steps were progressively taken to terminate the 'cultuurstelsel' and to introduce free cultivation. Cultivation of sugar under government control terminated between 1870 and 1891, and that of coffee in 1917.

In the earlier stages of its history the Dutch East India Company did little to define the respective rights of the cultivator, the ruler, and the state, and in Java large estates were sold with seigneurial rights over the heads of the Indonesian occupants. After 1835 various decrees prohibited the cession of different types of land to Europeans without a preliminary investigation into native rights,

¹ See Chap. XI, pp. 608 ff.

² H. T. Colenbrander, *Koloniale Geschiedenis*, 1926, vol. iii, p. 33.

but the law defined 'native lands' as the area in actual use, and the degree of protection afforded by it was limited by the latitude of interpretation which it permitted. The Agricultural Act of 1870 was designed to effect a closer definition; it allowed government to lease out uncultivated and unoccupied lands for seventy-five years; all 'free' lands were held to belong to the state. The land required for European plantations was obtained, however, not only through state sale or lease, but also by acquisition from natives. *Adat* law does not recognize the right of alienating land to persons who are not members of the community that claims ownership, even if they are Indonesians. Nevertheless, large tracts were ceded to Europeans by the Princes in the States of Java for sugar and tobacco cultivation, and the leaseholders obtained at the same time the right to labour service from the native occupiers. Since 1912 the government has adopted the policy of buying back the seigniorial estates, at great expense, and introducing fifty-year leases with annual compensation to the villagers.¹

The decree of 1870 gave Indonesian holders of rights over land the opportunity to obtain individual title. This step was considered premature, and a provision followed that made registration depend upon recognition by a judge of unencumbered individual right of possession. To operate the land tax it was decided in 1873 to introduce a register of property, the compilation of which, although it was confined to urban areas, provided experience which led in 1907 to the adoption for the whole of Java of the principle of utilizing the cadastre for land-tax assessment. The desire to register individual titles remained alive in some quarters, and between 1922 and 1924 more than 100,000 fields were surveyed, but the experiment was then discontinued on the ground of expense and because it was considered that individual tenure was alien to the native community, while the tax cadastre provided the Indonesian with all the security of tenure that he required.

✓ In the African territories state action in regard to land has followed three recognizable lines. There is, first, the group of states which have been influenced in their policy by the demand for land for European colonists or for mining interests; secondly, the group which has sought development mainly through the agency

¹ A. D. A. de Kat Angelino, *Colonial Policy*, 1931, vol. ii, pp. 474, 476.

of the native cultivator; and, thirdly, the group which has endeavoured to develop the resources of the territory by giving to Europeans large-scale concessions of land or of monopolies for the collection or sale of produce. The first group comprises the Union, the Rhodesias, Kenya, and Nyasaland, and it will be convenient when dealing with it to include a reference to the High Commission Territories. The second group contains the remainder of the British territories; the third, the Belgian and French territories, though the concessionaire system has now practically ceased to operate, and can never be said to have been applied in French West Africa. The classification is, indeed, to be regarded as the best means of exhibiting certain practical tendencies rather than as an attempt at exact description.

(b) *South Africa*

In the early history of Cape Colony circumstances did not seem to call for any definition of the legal position in regard to native lands. At the outset, when only Hottentots and nomad Bushmen were encountered, the available areas were so large and signs of settlement so far wanting that, had the question arisen, the land would no doubt have been described, in the phraseology of international law then current, as *territorium nullius*. When, towards the end of the eighteenth century, the Boers advancing northwards first met the southward migration of the Bantu, neither side could justly claim to have any superior rights in land, to which indeed they were both new-comers. The question of right, however, was not one which occupied the government of the time; its first problem was to establish a frontier behind which it could contain its own difficult and unruly colonists, and thus avoid the military consequences which each forward thrust involved. As it was, each extension of the frontier could mean only the assumption by the colony of full rights over the newly occupied land, with an implied power of alienation where circumstances, political or otherwise, were held to require it. There was a time (1835-47) when the adoption of the Glenelg policy of separation might have obviated the need for making any legal definition of native land rights, for the system of treaties on which that policy was based would have left Bantu tribes in independent possession of their lands, reduced

in area no doubt, but under their own control. But the forward thrust of farmers, encountering in its turn a forward movement of Bantu, made this policy impracticable; annexation was a decision of necessity, not of choice, and though throughout it was recognized that difficulties would inevitably ensue from the closer contact of the two races, nevertheless continued pressure from colonists drove the Cape Government forward: lands were allotted to meet the needs of farmers, until with successive extensions of territory it was found that the Kaffirs were too numerous or too strongly settled to permit of fresh expropriations.

In British Kaffraria, now known as the Ciskei, the abandonment of the 'treaty' policy resulted in the confiscation of land from rebellious tribes and the interspersing of Europeans among the natives as both a military measure and a financial expedient;¹ in other parts of the country the native reserve system was adopted. The system may be traced to an early stage of the Cape history, at which some effort had been made to provide for dispossessed Hottentots in the small settlements established under missionary influence at Bethelsdorp and elsewhere.² At a later date certain locations in the Ciskei were recognized as native areas, in which Europeans could not purchase land; a more important step was taken when in 1864 it was decided to treat the Transkeian territories, with the exception of a few small outposts held by Europeans, as semi-independent states in which land was not available for Europeans, a position which was not modified by the annexations which took place in various stages between 1879 and 1894. The native reserve policy proper may be said to have originated in Natal, where Shepstone's influence with the Natal Native Commission of 1846-7 resulted in considerable areas being left with natives on terms which protected them from further reduction by alienation.* The Crown maintained that arrangement when Natal became a separate colony in 1856, and in 1864 it regularized the position by vesting the lands in a Native Trust.³ When Zululand was annexed in 1897, with a promise of the preservation of its lands, a Lands Commission was instructed

¹ W. M. Macmillan, *Bantu, Boer, and Briton*, 1929, pp. 129, 267, 299.

² W. M. Macmillan, *The Cape Colour Question*, 1927, pp. 148, 271.

³ Letters Patent, dated April 27, 1864.

to provide liberally for natives in view of both their present and future requirements. Though their recommendations were cut down, about three-fifths of Zululand was formed into reserves and placed under the Zululand Native Trust.

In the Transvaal native land requirements received from the first less consideration than elsewhere; under the Volksraad resolution of November 1853 commandants of the republic were instructed to grant land for occupation by natives conditional on good behaviour,¹ but, recognizing only the limits set by malaria and the tsetse fly, farmers are said to have settled regardless of the native population.² The terms of the Pretoria Convention of 1881, which recognized the independence of the Transvaal, stipulated for the appointment of a Standing Native Location Commission, whose main duty was to assign to natives such locations as they might be fairly or equitably entitled to. Its recommendations appear generally to have been acted upon by the Transvaal Government, but the work was not completed before the Boer War; after the war the Crown Colony Government appointed a new Commission in 1905, and its reports were finally adopted in 1907. Some 1,999,000 acres were thus allocated as locations.

In the Orange Free State immigrant farmers found few natives, the country having been depopulated as the result of internecine strife, indirectly caused by the wars of Chaka in Natal. There are only three small reserves. The first, Witzieshoek, comprises the lands assigned to the tribe of Mopeli, a Basuto chief who submitted to the Republic during the Basuto War of 1865-6; the others comprise the remainder of the lands which the Basuto assigned in 1829 to a section of the Barolong which was driven out of Bechuanaland by Mosilikatze's forces. The Barolong, under their chief Moroka, subsequently assisted the Voortrekkers against the Basuto, and the former did not disturb them in the possession of their lands. When the 'Moroka Ward' was annexed in 1884, considerable areas were found to have been alienated to Europeans and natives. These grants were recognized by the government, and the Seliba and Thaba Nchu Reserves were in 1885 set aside for the accommodation of landless natives.

¹ H. Rogers, *Native Administration in the Union of South Africa*, 1933, p. 118.

² *The Cambridge History of the British Empire*, 1936, vol. viii, pp. 399, 816.

* These various measures had the effect of reserving for native occupation an area which, at the time of Union, amounted to 23,500,000 acres, or roughly 7·13 per cent. of the total area of the country. It is important to note the exact effect of this reservation.¹ The constitution of a native reserve meant only that the state refrained from making grants in the area so delimited and did not allow Europeans to purchase land in it; it did not mean that the land ceased to be Crown land. It is true that where trusts were created, as in Natal and Zululand, land could not be alienated without the sanction of the Secretary of State, and was therefore fully protected for native use, but, in point of law, annexed land remained Crown property until an individual title had been acquired in it either by grant or purchase from the state. It should be noted that up to 1913 lands held by Europeans could, save in the Orange Free State, be purchased from them by natives, and considerable areas were so acquired, particularly in the Cape Province. In the reserves, land was held in customary native tenure and not under any title which could be defined in terms of European law, except in the mission reserves in Natal where allotments of land had been made in freehold before the institution of the trust.

As part of the reconstruction which followed the Boer War, a Native Affairs Commission was appointed in 1903 to consider the policy to be applied to natives throughout South Africa.¹ Its report marks a definite stage in the history of the land question. Hitherto, the 'reserve' policy had been meant mainly as a protection to natives. Land distribution now became an important aspect of the policy of segregation which has since held the field in the Union.² The Commission was less concerned with the question of the adequacy of the areas occupied by natives than with the need for their strict delimitation, followed by the corollary that thereafter European interests should be protected by a provision that the native right of purchase should be strictly confined to prescribed areas. Effect was given to that policy in the Land Act of 1913, but General Botha, in sponsoring the Bill, was careful to emphasize that the natives had as much right to the country as the white man, and repudiated the idea that such legislation was

¹ See Chap. VI, p. 151.

² See Chap. V, pp. 130 ff.

aimed at providing a labour reservoir.¹ The Act, designed as an interim measure, scheduled the areas already occupied by natives, and restricted purchase outside, except in the Cape Province, where this prohibition was restrained by a judicial decision.² It provided for a commission to recommend what land should be permanently set apart as native and non-native areas. The Beaumont Commission, appointed for this purpose, proposed to set aside additional areas of 17,700,000 acres, bringing the native areas to 38,685,000 acres in all. It is possible to omit reference to the succeeding stages of these proposals, which took a course generally adverse to native claims, since recent events have brought an important change in the situation. Some account will subsequently be given of the nature of the change in policy;³ it will be enough here to summarize some of its results. The Native Trust and Land Act of 1936 purports to release from the restrictions of the Natives Land Act, 1913, for acquisition by or on behalf of natives, a maximum of 15,344,000 acres of land additional to the areas scheduled under the Act, and conveys a promise that the Union Government will assist in providing money for its purchase. Negotiations for the purchase of these lands are to be conducted by the Central Land Board constituted under the Land Settlement Amendment Act of 1934; the land will be held by the South African Native Trust, which will take over the functions of the trusts previously existing. Native trust land may be resumed for public purposes with the consent of both Houses of Parliament, and subject to compensation; it may only be sold or leased to non-natives if this is to the advantage of the native community. The restriction on purchase outside the scheduled and released areas is now extended to the Cape Province. It is proposed to expend a sum of £10,000,000 on the acquisition of the additional lands: it is assumed that this expenditure will eventually be recouped out of the payments the natives themselves make for the occupation of their new lands. Up to November 1937 approval had been given for the purchase of 824,900 acres at a cost of £1,304,000. The accompanying table gives a comparison of the proposed allocation of areas at different stages.

¹ Lord Olivier, *The Anatomy of African Misery*, 1927, p. 72.

³ See below, pp. 805 ff.

TABLE VII
ALLOCATION OF NATIVE AREAS IN ACRES (000's omitted)

Province	1 Area scheduled by Act 27 of 1913	2 Scheduled areas as extended by subsequent Acts	3 Additional areas recommended by Beaumont Com- mission 1916	4 The revised areas recommended by the local com- mittees of 1918	5 Maximum areas to be released under the Act of 1936	6 Total of scheduled and released areas (Cols. 3 and 5)	7 Percentage of column 6 to total area of province	8 Native rural population 1936 (000)	9 European rural population 1936 (000)
Cape .	12,791	12,925	2,779	3,404	3,420	16,346	9.2	1,826	287
Natal .	5,880	6,343	3,940	911	1,113	7,456	33.0	1,426	45
Transvaal	2,256	2,608	10,673	9,921	10,642	13,249	18.7	1,747	255
O.F.S. .	157	157	314	(alternative suggestions)	169	327	1.0	449	109

It must be noted that the operations contemplated by the Act of 1936 will not make a net addition of 15,344,000 acres to the land already occupied by natives, since some 2,500,000 acres of unalienated Crown land in the released areas, now vested in the Trust, carry a large native population and are not available for further settlement. On the other hand, natives hold in individual title some 1,393,000 acres in released areas and 646,000 acres in European areas, which are additional to the acreage shown in column 6. The land owned by natives in the European areas may be sold to Europeans and may not then revert to native ownership. Failing this contingency, and if the Trust acquires land to the full extent contemplated by the Act, the total available for native occupation will amount to 39,417,000 acres, or 13 per cent. of the area of the Union. The conditions under which natives will be allowed to occupy the land acquired by the Trust are determined by administrative regulations. These provide that the Crown land in released areas available for further settlement will be occupied by tribal groups at the annual rentals or taxes that were in force prior to the commencement of the Act, and which range from 10s. per adult male in the Cape to 30s. in the Transvaal and £2 in Natal. The purchased land will either be added to existing tribal locations or will be used to accommodate tribes and communities to which locations have never been assigned. In exceptional instances, individuals or groups will be allowed to purchase land from the Trust, or with its assistance from private owners. The policy to be adopted as regards the selection and valuation of land

to be acquired by the Trust and its allocation for native occupation was described in a statement issued early in 1937.¹

There is a further feature of land policy to be considered. The policy of segregation requires not merely that native land-holding should be restricted to scheduled and released areas, but that natives should not be allowed to occupy non-native lands, including Crown lands, in any manner which would militate against the principle of segregation; in other words, that they should reside there only as labourers. Ever since 1839 the law had consistently attacked the practice, commonly described as 'Kaffir farming', by which private lands were leased to natives for cash or a share of the produce; but legislation had hardly ever been effective. There had, however, been a gradual increase in the legal disabilities imposed on the squatter on Crown land, as in the Transvaal and Natal, where high rents were charged; as regards alienated lands, the previous series of Acts, differing in each province, had been reinforced by the more drastic Native Service Contract Act of 1932. Section 9 of this Act provided that, in districts proclaimed for this purpose, a landowner would be liable to an annual tax of £5 in respect of every able-bodied male native between 18 and 60 years of age who, whilst domiciled on the owner's land, did not work at least six months in the year for him under a service contract. The enforcement of this measure would have led to the displacement of large numbers of squatters for whom no land was available; no areas were therefore proclaimed under this section and its provisions have been superseded by those of chapter iv of the Native Trust and Land Act of 1936. This chapter, which governs the residence of the native population on farms in the European areas, operates only in proclaimed districts; it prohibits a native from living on land in such a district unless he is the registered owner, or a servant of the owner, or a registered tenant or squatter, and empowers the police to remove under warrant a native who has been convicted of unlawful residence. Servants are defined as natives continuously employed by the owner; the labour tenant is a registered native who is himself or a member of whose family is bound to serve the owner by a contract, which must be in writing if it stipulates for more than six

¹ *Statement of Land Policy under the Native Trust and Land Act, 1936.*

months' service in a year; and squatters are persons not included in either of these categories. No new squatters are allowed to be registered after the application of the chapter, while the owner is required to pay an annual licence fee, increasing from 10s. in the first two years to £5 in the tenth and subsequent years, for every squatter resident on his land. Labour Control Boards, consisting of two farmers and an official of the Native Affairs Department, may be appointed with power to determine the number of labour tenants required by any landowner for his bona-fide activities, and to reduce the number if it is considered excessive. In making the determination, the Board is obliged to presume, until the contrary is proved, that five labour tenants are required and that each is engaged to work at least six months a year. The owner may not keep more labour tenants on his land than the number fixed by the Board; the administration is charged with the duty of providing adequate accommodation for ejected natives in a scheduled or released area. The Act applies the penal provisions of the Masters and Servants' laws throughout the Union to labour tenants and members of their families who are included in the service contract, thereby bringing the Cape into line with the other provinces. A subsequent section of this chapter will deal with some of the effects of the policy embodied in these provisions.²

(c) *South-West Africa*

At the time of the first occupation of South-West Africa, the German Government appears to have implicitly recognized the rights of native tribes to their land, in so far that it made no explicit claim to ownership of vacant land. Orders of 1888 and 1892 prohibited unauthorized occupation of vacant land or transactions with natives, thus asserting the control of the state over the creation of new rights. The basis of the German protectorate, however, was a series of land purchases made from native chiefs by Lüderitz on behalf of the German Government, which usually covered their entire territory, and it is mainly on the strength of these agreements that the Germans occupied land required for colonists; it is of interest to note that the treaty concluded with the Rehoboth Bastards, who were not treated on the same lines

¹ See Chap. XI, p. 661.

² See below, pp. 807-9.

as natives, recognized the joint right of the community to their land. German settlement was confined to the central and southern part of the territory, now known as the Police Zone; Ovamboland and Okavangoland in the north were practically unadministered. Imperial proclamations of 1898 and 1903 provided for the establishment of native reserves, and for the expropriation by the state of land which was formerly native property in order to provide for the settlement of landless natives; but they do not seem to have been implemented. The discontent of various tribes at the loss of their land as the result of transactions with chiefs, the implications of which they had not understood, was one of the causes of the Herero and Namaqua rebellions, which were punished by the confiscation of tribal property. The decree of 1905 authorizing this action explicitly permitted the expropriation of reserved lands, and also of the lands of tribes whose organization had been broken up, and empowered the Governor to reduce unduly large tribal areas. The area left in the possession of native communities amounted to about a million hectares. A reversal of policy shortly before the War led to the issue of orders that reserves were to be allocated for native occupation, but no steps had been taken when war broke out.

South-West Africa was the only German colony lying largely outside the tropics, and the German Government actively encouraged colonization by its own nationals. The mandatory government confirmed existing titles and itself pursued a vigorous policy of settlement up till 1926 under the terms of the Union Land Settlement Act, which provides for state assistance towards land purchase. In particular the Union Government found land for the settlement of 301 families of Boers from Angola and contributed large sums for their assistance. The extent of colonization is shown by the fact that the Europeans in South-West Africa numbered 31,600 in 1935, as against about 10,000 in 1914. The total area of alienated land is 62,930,000 acres, or 31 per cent. of the territory, and a further 12,560,000 acres of surveyed Crown land are available for alienation. Land settlement was suspended for about three years after 1930, but later resumed. The Commission appointed in 1935 to make a general investigation into the situation of the territory did not take an optimistic view of the

possibility of expanding European settlement. In their opinion, all the funds available for this purpose for some time to come will have to be devoted to the assistance of farmers already on the land.¹

The position taken by the mandatory power in regard to rights over the land is as follows. Upon the assumption by the Union of the mandate for the territory, Proclamation 13 of 1920 extended to it the provisions of the Union Land Settlement Act of 1912 and the Transvaal Crown Land Disposal Ordinance of 1903, which had the effect of defining as Crown lands all unalienated land that was the property of the German Government, and in addition all land acquired by the Union Government. The same definition is contained in the Land Settlement Consolidation Proclamation 310 of 1927, which superseded the 1912 Land Settlement Act. At the end of the War, the native population, with the exception of the Ovambo tribes in the north, were scattered, and many natives were residing on private farms or had left the territory. The relaxation of pass restrictions and the right granted to natives to acquire large numbers of stock before provision had been made for their location in reserves led to further movement and an increased need for grazing lands. To secure increased areas of land for the purpose, a commission was appointed in 1920 and met in 1921, when it made a survey of vacant government land. Difficulties arose in securing areas in which there were water supplies, or in providing room for extension, but between 1923 and 1925 certain new reserves were set aside, and Proclamation 9 of 1924 provided for revenue from native sources in these reserves to be paid into native trust funds to be expended solely for native development.

The fund for each reserve is administered by a Board consisting of the Native Commissioner as chairman, the native headmen, and six other persons elected by the natives themselves. Revenues consist of grazing fees, rentals, and dog tax, and sometimes special levies made by the chiefs. An account of the administration of the fund is made annually to a general meeting of the residents of the reserve, when an opportunity is provided for discussion and suggestions. Once land is proclaimed as a native reserve it cannot be

¹ *Report of South West Africa Commission*, U.G. 26, 1936, para. 168.

alienated except with the consent of both Houses of the Union Parliament. The land rights in the reserves are the same as in the Union, and are covered by section 4 of the Act of 1919 (No. 49). The movement of natives into the reserves has of necessity been slow, and involved the collection of cattle, and the assembling of a scattered people whose habits were nomadic, and whose circumstances have been against the development of an agricultural life. Most of the land available required the expenditure of large sums of money for such necessities as water-supplies, fencing, and dipping tanks, which have to be found from the Trust Funds, supplemented by considerable sums out of general revenue: for example, in 1933 £40,000 was granted for this purpose. Between 1923 and 1932 eleven reserves, amounting to a total area of nearly 3,000,000 hectares, were proclaimed in the Police Zone. About 6,500,000 hectares (16,000,000 acres) in the east of the territory, described as a 'reserved native area', are also earmarked for acquisition by natives in the future. The total area of land held by natives, which includes certain areas other than the proclaimed reserves, amounted in 1936 to about 16,325,000 hectares (40,339,075 acres).¹ The reserves are scattered and some are surrounded by European areas. The recent additions show that it is recognized that in some cases they are inadequate, large areas being necessary in a country which is mostly prairie, lacking water, and only fitted for stock-raising. Except in urban areas no legal restriction has at present been imposed on the acquisition of land from Europeans by natives: few of them, however, have the necessary financial resources.

(d) *The High Commission Territories*

The position of the British Government in regard to land in Basutoland has from the first been clear. The main object of the Proclamation of March 1868, declaring the country British territory, was to prevent the Free State from making further attacks on the native lands, which had already been largely reduced by the Treaty of Thaba Bosigo in 1866; the Treaty of Aliwal North in 1869 regained for the Basuto a large portion of the corn lands which would have been lost under the previous treaty. In the

¹ *Official Year Book of the Union of South Africa*, 1937, p. 1156.

Regulations of 1870 the right of allotting land for occupation by members of the tribes was vested in the High Commissioner: this, as an announcement made in 1869 shows, was intended only to be the assumption of a right which had 'been always held by the supreme authority in every tribe'. In practice, this power has been left in the hands of the Paramount, and its exercise is regulated by customary law as recognized in the Code of Lerothodi;¹ but it is subject to the statutory restriction of Proclamation 65 of 1922, that any concession or grant made by the Paramount is invalid unless approved by the British Government. If there is a land problem in Basutoland it is mainly due to the reduction in area by the Free State campaigns previous to 1868. These were essentially land wars, and deprived the Basuto of some of their most fertile and well-watered lands. The Basuto numbered 560,000 in 1936. Even in 1861 the population was held to be congested as judged by African standards;² the area left in 1868 to the native population was 11,716 square miles, much of which is mountain or ravine, and the progressive decline in the agricultural conditions of the territory is due to overcropping and the consequent denudation and erosion which have followed from the attempt of the Basuto to adapt themselves to their altered conditions.³ Since annexation, the only land grants made have been small plots for schools, trading sites, or mission stations, and Basutoland is otherwise entirely in native occupation.

In Swaziland the position has been complicated by the grant of land cessions on the widest scale by the chiefs ruling between 1878 and 1890; it was, indeed, at one time calculated that they had 'conceded' more than the total area of the country; and when the British Government took over the territory from the Transvaal in 1903 its main concern was the problem thus created. By the Swaziland Crown Lands Order in Council, 1907, and the Concessions Partition Proclamation of the same year, government assumed the right, first, to adjudicate on the validity of concessions already made, secondly, to set aside such land as was needed for the exclusive use of the natives, and, thirdly, to treat the remainder as Crown land available for grants to non-natives. The legality of

¹ See Chap. IX, p. 398.

³ See Chap. XVI, pp. 1084-5.

² *The Cambridge History*, op. cit., p. 813.

these measures was upheld by the Privy Council¹ in a judgment which, though of interest, did not deal with the question whether the chief had the right to make concessions of tribal land, nor did it discuss whether the Crown by virtue of its position was entitled to claim rights over the unalienated land.

The position in regard to native lands is on the whole less favourable than that of Basutoland. The result of the proceedings of 1907 left the total area of 4,290,000 acres divided roughly into a native area of 1,638,000 acres and a Crown area of 1,115,000 acres, the rest being in the hands of European concession holders who received freehold title from the Crown. The Swazi have since repurchased certain areas, having borrowed from Basutoland for the purpose, and the Crown has alienated considerable areas out of its own portion. The present figures are: 2,423,000 acres in possession of Europeans or under agreement for sale; 1,706,000 acres in 31 scattered blocks held by natives; and 157,700 acres of Crown land. In 1936 the native population was 142,600 and the European 2,735. The fact that the Crown should have alienated any part of its own holding would seem to show inadequate regard to the needs of the Swazi population. Though 40 per cent. of the European holders are absentees, and a considerable proportion of the grants made to them are in the form only of grazing leases, there seems small probability in normal circumstances of any of the area now in their hands becoming available for native acquisition. There has been as yet no legislation similar to that of the Union directed against native squatters on European farms, but the 20,000 natives resident on these lands have no security of tenure, and farmers receive a money rent up to £1 per hut or insist on labour services for periods up to six months.

In 1885 British jurisdiction was extended by Orders in Council over the region now known as the Bechuanaland Protectorate, and over British Bechuanaland in the south; the latter was constituted a Crown colony in 1885 and annexed to the Cape in 1895. The Royal Charter granted in 1899 to the British South Africa Company brought within its field of operations the territory north of British Bechuanaland, but the protectorate remained under imperial control. Here the Crown in 1885 and again in 1895 dis-

¹ *Sobhuza II v. Miller*, (1926) A.C. 518.

claimed ownership of the land on the ground that as its own position did not amount to sovereignty the waste lands were vested in the chiefs themselves.¹ In 1895, when it was proposed to cede the territory to the Chartered Company, the Tati Concessions Company already held the Tati block, obtained by it on a grant from Lobengula about 1887. The strong protests of the chiefs against the proposed cession turned mainly on the fear that this would involve a change in native rights in the land; and when finally it was agreed that the concession to the company should be limited to the railway 'strip', the latter area was obtained by agreement with the chiefs. Meanwhile, however, the grant of land concessions to European farmers by the chiefs themselves had forced government to exercise a measure of control; a proclamation of June 10, 1891, declared that titles would be valid only if sanctioned by government, and in 1896 it was announced that claims made by any tribe to land would be recognized only if based on occupation which had taken place before the declaration of a protectorate or, if subsequent to that date, then with the consent of the High Commissioner.

In 1898 a commissioner was appointed to delimit tribal boundaries, and five tribal areas were demarcated which received the name of reserves. This operation left an area outside the reserves over which no tribe had proved occupation, and by Orders in Council of 1904 and 1910 these areas were vested in the Crown, it being announced that the chiefs had 'abandoned all rights and jurisdiction in and over' these areas. No tribal claims to land outside the reserves are now recognized unless the land has been occupied with the express sanction of the Resident. The total area of Bechuanaland is 275,000 square miles, now divided as follows: reserve area, 102,000 square miles; old alienated areas, 7,500 square miles; Crown land, 165,500 square miles. The waterless Kalahari carries only a few thousand Bushmen, Hottentots, and Kalahari, and the great bulk of the native population is concentrated in the reserves; the European settlements are largely confined to a narrow strip along the eastern border, including the

¹ Sir Clarkson Tredgold, 'The Constitutional Position of the South African Protectorates', *Journal of the African Society*, vol. xxxiii, 1934, pp. 388-9. See also Chap. IX, p. 404.

Tati District, Ghanzi on the western frontier, and the Gaberones and Lobatsi blocks. The terms upon which alienation of the Crown lands may be made have not been decided, and they remain practically unoccupied and almost wholly undeveloped.

The question of transfer of the High Commission Territories to the Union, which has recently attracted much attention both in South Africa and in Great Britain, is discussed in Chapter VI.¹

(e) *Southern Rhodesia*

In Southern Rhodesia the legal position in regard to the rights to be exercised over land received no definite consideration till the period when the British South Africa Company and the British Government were at issue regarding the terms on which the charter of the former should be wound up.² The original concessions given by Lobengula were for mining rights; Baines and Sutherland had secured agreements of this nature in 1871 and 1872, and in 1888 the agents dispatched by Rhodes had secured the grant, usually known by the name of the Rudd Concession, of all mineral rights; it was this grant which formed the basis on which the Royal Charter was secured for the Company in 1889. In granting the charter, the Crown did not itself assume sovereign rights over lands in the territories included within its scope, but it authorized the company to hold and administer rights obtained under the 1888 agreement, or by any subsequent agreements; it was, however, a condition of the validity of such agreements that they should be seen and approved by the Secretary of State. (In exercising the general powers of administration which the charter further conferred, subject to the general control of the Secretary of State, the Company was to have regard to the laws and customs of the people, especially those concerning the holding and disposition of lands. Subject to the preceding conditions it could make grants of land or mineral rights either on freehold or on leasehold. (In 1890) Edouard Lippert secured a concession from Lobengula empowering the holder to grant, lease, or rent land in his (Lobengula's) name, and this concession was subsequently acquired by the Chartered Company.) In granting mineral

¹ Pp. 173-7; M. Perham and L. Curtis, *The Protectorates of South Africa*, 1935; statement by the Rt. Hon. J. H. Thomas, *Parliamentary Debates, House of Commons*, vol. ccciii, 1934-5, cols. 593-7.

² See Chap. VI, p. 157.

rights the Company acted on the strength of the Rudd Concession, and they made also considerable grants of land, both to colonists and companies, on the authority which they had obtained by means of the Lippert Concession.) In the latter operation their action was subject to some measure of control by the British Government: the Mashonaland Order in Council, 1891, declared that land titles should not be valid without the assent of the High Commissioner, and the concern at the scale on which alienations were being made led in 1894 to the appointment of a Land Commission, which was directed to assign an adequate area of land to the natives of Matabeleland. The Southern Rhodesia Order in Council of 1898, which created an administration with legislative capacity, varied the original terms of the company's charter to the extent of requiring it to assign to natives land sufficient for their occupation; the steps taken to implement this provision will be subsequently referred to.

The question of the Company's right to dispose of land has an important history. The matter was raised in the first legislative council by elected members as early as 1898, and again in 1903-4 in connexion with a report by Sir George Goldie.¹ In 1908 settler representatives claimed that money received from the sale of the land still unallotted should be credited to the budget of the territory and not to the Company. This point became an issue in the discussions regarding the financial adjustments to be made on winding up the charter, and the question of ownership of the land was referred by the Crown to the Judicial Committee of the Privy Council, whose report, delivered by Lord Sumner on July 29, 1918,² stands as one of the classic pronouncements on land rights in British colonial territories. It is of especial value because the claim of natives to these lands was made a definite issue. On the other hand, it must be noted that the scope of the report was in any case limited by the fact that it referred only to the unallotted lands: neither the mineral rights nor the validity of the land titles which had already been given by the company in virtue of the authority obtained through the Lippert Concession were in issue.

The Council held that the Lippert Concession could not be

¹ *British South Africa Company's Directors' Report and Accounts for the year ending 31 March, 1903, 1904*, p. 2; *British South Africa Company's Report of the Ninth Ordinary General Meeting, 1904*, pp. 12 ff.

² *In re Southern Rhodesia* [1919], A.C. 211.

taken to have conveyed any authority over the unallotted lands; it conferred only certain rights to act as Lobengula's agent in the disposal of lands, and this right ceased with the conquest of the country in 1893. In the Matabele campaign the Company had acted only as agent of the Crown, and sovereign rights thus passed to the Crown by virtue of conquest. The Crown could have exercised its sovereign powers in 1893 to declare itself owner of all lands not held in private right, and had it done so the question as between the Company and the Crown regarding the unalienated lands could not have arisen. The court had, however, still to consider whether such rights as were possessed by the natives of the country constituted private rights which the Crown could be required to recognize, in view of the acknowledged principles of law regulating the position of the sovereign power towards private rights in conquered territory. These principles will be referred to in a later section of the present chapter;¹ it is sufficient to state here that the Privy Council found that such rights as the natives of Southern Rhodesia possessed at the time of conquest could not be described as falling into the category of rights of private property which the sovereign power would be required to recognize; and the unalienated land, which included the native reserves, was, therefore, held to be the property of the Crown. As has been stated above, the mineral rights were not in question: they remained with the Company, and were acquired by the Southern Rhodesian Government for £2,000,000 in 1933.²

The establishment of responsible government in 1923 would normally have left the new government with full powers to deal with unalienated lands, including the reserves. But an Order in Council of 1920 had already vested the reserves in the High Commissioner in South Africa, and section 42 of the Letters Patent of 1923, in confirming this provision, expressly laid down that those lands should not be alienated save for the purposes laid down in the Order of 1920, and then only in exchange for other suitable lands. The provisions of section 26 of the Letters Patent prohibit the local legislature from affecting section 42, which can only be modified or revoked by Order in Council.

The determination of rights in the land has, therefore, followed

¹ See below, pp. 829 ff.

² See Chap. XXII, p. 1519.

the same course as in the Union, in so far that all land has been assumed to be Crown land until alienated in individual title. There has, however, been a substantial difference in the provision made for the native in the matter of land, and also in a further important respect. The Charter of 1898, reproducing in this respect the old Cape Colony rule, did not permit of a legal discrimination against natives in the matter of land purchase, and both races had an equal right to acquire land outside the reserves; but, in the case of natives, contracts for sale or encumbrance had to be made in the presence of a magistrate and certified by him as fair.¹ This provision was maintained by section 43 of the Letters Patent of 1923.

The first allocation of land made by the Land Commission of 1894² was ill considered; the attempt made to confine natives to two large reserves was never practicable, and the failure to make suitable provision for native needs is admitted to have been one of the causes of the Matabele rebellion. A further commission which the company was required to appoint in 1914 resulted in the creation of 104 reserves having a total area of some 21,600,000 acres; there was then a population of about 834,000 natives, of whom some 500,000 were resident in the reserved areas. These were finally gazetted in 1920. Even allowing for the fact that about 3,000,000 acres of this area were unsuitable for settlement, the provision was much more generous than that made for native lands in the Union or in Kenya.³ There were, however, influences which before long led to further consideration of the system adopted in the allocation of the reserves. Under the provision which allowed both races an equal right of purchase outside the reserves, natives had by 1923 purchased about 100,000 acres in the European farming districts, and this fact produced from settlers a general demand for separation of the areas available for European and native occupation. With the assent of the British Government, which expressed unwillingness to modify the long-accepted principle of equal rights of purchase, a commission was appointed in 1925 to consider whether any change was justified in the provisions of the charter relating to native lands, with particular reference to the

¹ Order in Council, Oct. 20, 1898, sect. 83.

³ See below, pp. 805-9, 811-13.

² See above, p. 733.

proposal to restrict the native power of purchase to areas set aside for the purpose.

The commission¹ held that from both the European and the native standpoint it was desirable to separate as far as possible the areas held by the two communities; 'until the native has advanced much further on the paths of civilization, it is better that the points of contact in this respect between the two races should be reduced'. The detailed proposals made to secure this end seemed to the British Government to justify their holding that it would be permissible within the terms of the 1898 clause to reserve separate areas for purchase by Europeans and natives respectively. The allocations which had been made in 1914 prevented any such radical readjustment as would effect complete territorial separation, and (though the Land Apportionment Act of 1930, which gave effect to the commission's views, made provision for some considerable interchange of areas, the two communities still remain much intermingled. (Nor was it possible to form the reserves into large homogeneous blocks; they are still eighty-three in number, and often divided by European lands.) But the main feature of the scheme was the provision for each community of an area into which it can expand by purchase, while neither community can in the future invade the area left for the expansion of the other.

A body of opinion in Southern Rhodesia favours a native policy involving segregation in the sense in which that term is used in South Africa.² The Union, however, while admitting that the native should have the means of achieving a suitable development in his own areas, has by the restriction of those areas placed a limit on the means available to the native for improving his condition in them; Southern Rhodesia has not only set aside a relatively greater area for present and future native occupation, but by the provision of purchase areas has made a fuller recognition of the needs of the individual native who has reached an economic or social stage in which residence under tribal conditions is no longer desirable. The results which will ensue if the powers

¹ *Report of the Land Commission*, C.S.R. 3, 1926, para. 63.

in the Act are fully utilized were shown in a statement¹ issued in 1935 given in the following table:

TABLE VIII

	<i>Acres</i>	<i>Acres</i>
Forests, National Parks, Towns, &c. (approximate)		2,000,000
Area alienated to Europeans up to 31/12/1933	32,100,000	
Unalienated Crown land available for European settlement	15,076,700	
Total European area		47,176,700
Native Reserves as defined by the 1920 Order in Council	21,595,000	
Lands already acquired by government which may become native reserves or native area	82,000	
Area scheduled by Act of 1930 as land open to native purchase	7,464,560	
An undetermined area which natives are expected to take	88,540	
Total native area		29,230,100
Unassigned area		17,793,300
Total area of Southern Rhodesia		96,200,100

The destination of the large unassigned area was left for future determination, but it has been stated that some 12,000,000 acres may possibly be taken up by natives. Large areas of it are infested with tsetse and other parts are deficient in water. The scope which the scheme provides for possible addition to the 'native area' is, therefore, not so large as might at first appear. In the discussions which have taken place regarding the modification of the constitution of Southern Rhodesia,² the British Government has agreed to the principle that the native reserves should no longer be vested in the High Commissioner, but in a Board of Trustees consisting of a chairman nominated by the Secretary of State, the Chief Justice, and the Chief Native Commissioner. The Act of 1930 contemplated a period of six years, subsequently extended to 1941, for natives to move into the reserves allotted for them; but various exceptions were made to this provision. On unallotted Crown land they were to be permitted to remain on such conditions as the government might prescribe, and it is now thought probable that they will not be ejected from this land until it is

² *Proposed Amendment of the Southern Rhodesian Constitution*, Cmd. 5218, 1936, para. 11; see also Chap. VI, pp. 178 ff.

taken up by colonists. In certain areas in Matebeleland where natives have been resident since Lobengula's days, the termination of existing tenancies has not been required, and in the Melssetter district the terms on which native occupation is to be permitted are left by the Act to be fixed by regulation. In general, however, only labour tenancy agreements were permitted. The government has made considerable progress in repurchasing lands which were held by Europeans in areas which are now to be occupied by natives. Up to December 1936, 180,400 acres were purchased; and 440,298 acres in the European area have also been bought for native occupation.

(f) *Northern Rhodesia*

In Northern Rhodesia the history of land rights is also partly that of the British South Africa Company. The charter was extended in 1891 to cover operations north of the Zambesi, but already agents of the Company had made agreements with certain of the chiefs in the north-eastern areas of Northern Rhodesia, though they were unsuccessful in securing a treaty from the Ngoni chief, Mpeseni. In 1893 the Company received from the Commissioner and Consul-General in British Central Africa 'certificates of claim' for 2,758,000 acres in the Tanganyika district of North-Eastern Rhodesia. It proceeded to make grants on the strength of these certificates and the agreements with the chiefs, and though its authority to do so is open to doubt, its action was subsequently recognized by the British Government. In 1895 it alienated 10,000 square miles in North-Eastern Rhodesia to the North Charterland Exploration Company, as part of the arrangement for extinguishing the concessions which the German Karl Wiese claimed to have received from chief Mpeseni. In the north-western and central parts of Northern Rhodesia it acted on a treaty obtained in 1900 and an agreement of 1909 from Lewanika, the paramount chief of the Rozi, who claimed a wide authority outside his own territory of Barotseland. These gave rights to deal with all lands outside Barotseland. Whether Lewanika had power to confer rights over lands outside Barotseland proper has been doubted, but it is a point which is now mainly of academic interest in view of the subsequent action taken by the Crown.

In a series of Orders in Council, beginning with the Barotseland-North-Western Rhodesia Order in Council, 1899, the British Government laid down certain important conditions regulating the Company's disposal of land. The first maintained the complete reservation of Barotseland both from alienation and prospecting for minerals; the second required that sufficient land should from time to time be reserved in Northern Rhodesia for native occupation; the third, that no native should be removed from any kraal save by order of the Administrator. These last provisions are important, since the question whether the regulation requiring the setting aside of reserves was equally binding on the North Charterland Company in regard to the 10,000 square miles acquired by it was the main issue in the claim which it brought against the Crown in 1929, and formed the occasion for the arbitral report by Mr. Justice Maugham,¹ which constitutes another of the classic documents on land rights in the colonies. It was ultimately accepted that the Company was bound by this condition.

When the charter was in process of termination in 1923, the land question was not referred to the Privy Council, as had been done in the case of Southern Rhodesia, and the rights of natives in the land did not come under judicial review. The British Government maintained the British South Africa Company's title to the areas held by it in North-Eastern Rhodesia under the 'certificates of claim' and also the concession to the North Charterland Company, subject to the setting aside in both areas of such native reserves as it deemed proper; it confirmed the title in all alienations made by the Chartered Company. Over the remaining land the Crown has full control, save that it has declared that the alienation of land in Barotseland shall not be lawful for any purpose whatever. The Company will receive half the proceeds of all sales or leases of land in North-Western Rhodesia up to 1965, and retains mineral rights over the whole of Northern Rhodesia, except Barotseland.

The question of the areas which should be delimited as native reserves was considered in a series of inquiries beginning in 1903, and certain reservations were made, though apparently only as a provisional measure. This was certainly the case as regards that

¹ *North Charterland Concession Inquiry*, Colonial 73, 1932.

made for Mpeseni and the Ngoni in 1907. In 1913, however, discussions were held in which the chiefs themselves showed a growing anxiety to secure areas which would be free from European encroachment, and the prospect of such security was clearly the inducement which made many of them agree to move with their people into reserve lands. The 1913 discussions resulted in proposals being made for the creation of thirteen reserves, but formal proceedings were delayed pending the report of the 1915 Commission in Southern Rhodesia, and further delay was caused by the War. Three commissions were subsequently appointed to make detailed proposals for the constitution of reserves; one dealt with the East Luangwa Province in connexion with the North Charterland estates in 1924-5, one with the lands in the neighbourhood of the settled and mining areas along the railway line in 1926-7, and one with the Tanganyika Province in connexion with the Chartered Company's land in 1927. Their reports afford a valuable source of information regarding the conditions of native life in the territory. Effect was given to their recommendations by the Orders in Council of 1928-33, which declared that the lands were vested in the Secretary of State, and set apart for the 'sole and exclusive use of natives'; the orders are worthy of note in that they do not allow non-natives to acquire land in the reserves, save upon lease for a period not exceeding five years, and while providing that land can be excluded for public purposes, require the sanction of the Secretary of State if the area exceeds 100 acres. They further keep alive in Northern Rhodesia the clause introduced into the 1898 Charter of the British South Africa Company, which gave natives a right to acquire land on the same terms as Europeans.¹

The reserves thus created, though coming under the same legal provisions, were of two descriptions—namely, the areas reserved out of the large company estates under the terms regulating their alienation, and the lands set apart for native use within the areas defined as Crown lands. Economic conditions and the falling demand for land by Europeans had by the time the Orders were issued lessened the pressure for the removal of natives into the reserves, and it was only in the case of the Company's concessions in the Tangan-

¹ Northern Rhodesia Order in Council, 1924.

yika Province that the Order in Council definitely required their removal within four years.¹ In some areas, however, natives have been moved out of Crownlands into the nearest reserves, a procedure which has proved unpopular with the natives and has in some cases been opposed by neighbouring European farmers as reducing the supply of labour available to them. Elsewhere natives have been allowed to remain in their old villages outside the reserve boundaries, but new villages are required to be built within the reserves. The Natives on Private Estates Ordinance of 1929, which permits natives to settle as labour tenants on farms, but prohibits the leasing of land for a cash rent, has not yet been put into operation. The land situation after the gazetting of the reserves is shown by the following table:

TABLE IX

	<i>Acres</i>
Barotseland	36,819,200
Area of reserves	34,712,800
Area alienated in freehold and in individual titles	8,794,775
Game and Forest Reserves	5,011,690
Crown lands	100,499,800
Total area of territory	185,807,000
Native population (1936)	1,366,425
European population (1936)	10,588

It is proposed to replace the present system by legislation modelled on that recently introduced in Nyasaland.² All unalienated land found after survey to be unsuitable for non-native settlement and to contain no valuable mineral deposits, will be declared Native Trust Land, in which all the existing reserves will be merged except those on the estates of the British South Africa and North Charterland Companies. Natives from congested reserves will be moved to areas thus thrown open for their occupation. Alienations of native trust land to non-natives will be allowed for a period up to 99 years, but only for purposes held by government to be in the native interest after consultation with the native authorities concerned, the proceeds of alienation being payable to native treasuries. The areas held suitable for non-

¹ The Northern Rhodesia Crown Lands and Native Reserves (Tanganyika District) Order in Council, 1929.

² See below, p. 757.

native settlement or mining will be retained as Crown land. Barotseland will be excluded from the operation of this scheme.¹

(g) *Kenya*

The history of land rights in Kenya has its origin in the days when the Imperial British East Africa Company, which received its charter in 1888, was extending its hold over the mainland on the strength of the grant obtained from the Sultan of Zanzibar in 1887. The charter was in all material points in the same terms as that granted to the British South Africa Company, to which reference has been made.² Settlers had already acquired some lands either by purchase from chiefs or from the British East Africa Company before the East Africa Protectorate was declared in 1895, in which year also the charter of the Company was terminated. As shown in reference to Bechuanaland,³ and as will subsequently be shown when dealing with land rights in Uganda,⁴ there had at one time been considerable discussion as to the nature of the rights over land which the state could assume, under the general provisions of the Foreign Jurisdiction Act, on the declaration of a protectorate; but in 1899 the British Government had accepted the view of its legal advisers that the declaration of a protectorate enabled it to claim sovereign rights over land, subject to the recognition of any private rights then existing. In general terms, this was considered to give the right to dispose of 'unoccupied' lands.

Regulations had been issued in 1897 which provided that a certificate might be given for the occupation of land up to a maximum period of twenty-one years, but further stipulated that a certificate would not be granted in respect of any land cultivated or regularly used by any native or native tribe. These regulations were in terms similar to those issued in Uganda in the same year and were intended to meet the same situation;⁵ it should be realized that what is now the Nyanza Province and the greater part of the present Turkana District were then included in Uganda. Fortified by the legal advice of 1899 the government was now

¹ *Report on the Economic and Financial Position of Northern Rhodesia*, Colonial 145, 1938.

⁵ See below, p. 759.

able to plan the introduction of conditions more suited to local circumstances, though there is evidence that it was intended to defer the allotment of land on any large scale until the railway to Uganda, which was sanctioned in 1895, had been completed. The railway was completed in 1901, and at once created a new problem for the administration; for the maintenance of a line running along difficult gradients through 580 miles of empty country put a severe strain on the resources of the protectorate.¹ It was this, combined with a growing feeling that the highlands of Kenya were, as Lord Lugard had represented as far back as 1893,² well suited for European settlement, that induced the British Government to endorse the policy of colonization put forward in 1903 by Sir Charles Eliot.³ He went so far as to express a belief that East Africa would in a short time become a white man's country, in which native questions would present but little interest. The great pasture lands and the highlands appeared at the time to be almost free of inhabitants. The predatory raids of the nomad Masai had kept much of the highlands free from occupation by sedentary tribes; like the Matabele and Ngoni they had spread terror through the country and appropriated immense tracts for grazing grounds. Not even the slave-trading Arabs had dared to challenge their supremacy, and earlier European explorers were content to pay 'hongo' to them. But when the prospect of European occupation first presented itself, the Masai no longer appeared to constitute the same danger; the great cattle epidemics of 1883 and 1889, and the internal feuds of 1890, had reduced them to a condition which seemed to remove the obstacles to colonization which their neighbourhood had once presented. It is well to emphasize here that the schemes of settlement affected mainly the highland areas, roughly about one-thirteenth of the whole territory; the most crucial aspect of the land problem is confined to this region and its neighbourhood, and the rest of the country has been affected only in a minor degree.

The need for a more definite control over lands for the purpose of colonization was met by the issue of the East Africa (Lands)

¹ See Chap. XXIII, pp. 1582-4.

² F. D. Lugard, *The Rise of our East African Empire*, 1893, vol. ii, p. 656; see also Sir H. Johnston, *The Uganda Protectorate*, 1902, vol. i, p. 299.

³ *The East Africa Protectorate*, 1905.

Order in Council of 1901. This measure proceeded on the assumption that lands required for disposal must first be brought into the category of Crown property, and it defined accordingly as Crown lands, 'all public lands which for the time being are subject to the control of His Majesty by virtue of any treaty convention or agreement, or of His Majesty's Protectorate, and all lands which have been, or may hereafter be acquired by His Majesty under the Lands Acquisition Act, 1894, or otherwise howsoever'. It went on to give general authority to dispose of such lands by sale or lease. It may be noted that the Act of 1894 referred to was an Indian law which had, as in Uganda,¹ been adopted for the purpose of legalizing the purchase of land for state uses. In the use of the word 'public' as applied to land the Order in Council clearly referred by implication to those 'unoccupied' lands over which it was now accepted that the protectorate had powers of control. It was, however, unfortunate that the order failed to define in terms the character of the 'public' lands to which it referred, or failing that, to add such provisions as would have guided the administration in the interpretation to be placed on the extent of its authority over 'occupied' lands. The terms on which 'Crown' lands, as described in the Order of 1901, could be granted were laid down in the East Africa Order in Council, 1902, followed by the Crown Lands Ordinance of that year, which made, however, no further definition of the 'Crown' lands in question.

The Ordinance of 1902 was clearly intended to offer terms more attractive to settlers than those of the Regulation of 1897; the sale as well as the lease of Crown lands was allowed, and provision was made for the grant of areas on the homestead principle—namely, up to 640 acres. Despite its failure to define further the nature of the Crown lands, the Ordinance repeated the stipulation, based on the Regulation of 1897, that 'in all dealings with Crown land regard shall be had to the rights and requirements of the natives, and in particular the Commissioner shall not sell or lease any land in the actual occupation of the natives'. Though the Commissioner could grant leases of land containing native villages, land in occupation by natives was deemed to be excluded from the lease so long as actually occupied. In 1903 the British

¹ See below, p. 759.

Government gave an indication of its new policy by offering the Zionist Organization a national home in the Uasin-Gishu plateau, an offer which was not accepted. The land grants increased rapidly in 1902 and 1903 and it soon appeared that the administration had underestimated the extent to which natives could assert claims to the apparently empty lands of the highland area; it was at all events clear that by recognizing native occupation only over land in actual cultivation and by allowing grants to be made over that used for grazing, Europeans had been permitted to acquire land in a manner that was beginning to cause hardship to the tribes concerned. To quote an expression subsequently used, the alienation process rapidly 'got out of hand'.

A local committee appointed in 1904 recommended that in view of the difficulties arising from the dispossession of natives, areas should be reserved for them, and added that the fixing of such reserves should precede the further extension of European settlement. The reserve policy was accepted by government, and during the next few years various areas were reserved for native occupation. It is necessary, however, to be clear as to the exact nature of this operation: its purpose was to secure the highlands for European occupation by the process of delimiting in the form of native reserves the areas to which it was intended that surrounding tribes should be restricted. Had the limits of intended European occupation been clearer from the first, many of the subsequent incidents which cast doubt on the good faith of government might have been obviated. As it was, areas which at this stage were proclaimed from time to time under the Outlying Districts Ordinance were not in fact reserved, and some alienations were actually made in proclaimed areas. The limits set to areas in which cattle-owning tribes might graze their cattle frequently deprived them of essential pasture and left watering-places and salt-licks outside native lands. In some cases the movements have involved the settlement of one tribe on areas claimed by another.¹ An incident which arose in connexion with lands allotted to the Masai directed public attention to the insecurity of tenure in these 'reserves'. An agreement had been made with the Masai in 1904 regarding the lands they were to occupy, but as it was subsequently

¹ L. P. Mair, *Native Policies in Africa*, 1936, p. 82.

desired to move them from part of this area, the Laikipia, a fresh agreement was made in 1911. Dissatisfaction with the transfer resulted in an action being brought against the Secretary of State by a section of the tribe in 1912; its main purpose, however, was not to contest the right assumed by the Crown over lands, but to prove that the 1911 agreement was improperly obtained. It was decided by the East Africa Court of Appeal on the strictly technical point of jurisdiction.¹ The court held that the agreement was not a contract but a treaty, and that treaties entered into by foreign subjects (the technical status which the Masai then had as residents in a protectorate) were not cognizable in municipal courts.² The correctness of the decision is debatable; the Masai were given leave to appeal to the Privy Council, but could not afford to pursue it. It may be noted that, whatever the merits attaching to the technical point at the time, it ceased to have force when Kenya was subsequently proclaimed a colony, and the Masai acquired the status of 'subjects'.

The action of the government in disposing of lands now came under attack from two different points of view. Those interested in advancing the programme of colonization held that the conditions prescribed in the Order in Council of 1902 impeded the development of the colony, a view strongly expressed by the Local Land Board instituted in 1904. The Colonial Office was, on the other hand, impressed with the need for preventing land speculation, rife at the time, and the accumulation of large areas not subject to stipulations regarding their beneficial use.³ The controversy turned mainly on the terms on which leases were granted; the Land Board demanded perpetual leases without reassessment of rent; the Colonial Office, which had at first stipulated for twenty-one-year leases, subsequently agreed to a term of ninety-nine years with periodical revision of rents, together with such provisions for controlling transfers as would prevent large accumulations of holdings in the hands of a single person or body. A Bill put forward in 1908, to include these provisions, was withdrawn owing to local opposition, and a similar fate befell another

¹ *Ol Le Njogo v. The Attorney-General, E.A.L.R.*, 1913, vol. v, p. 70.

² See Chap. VII, pp. 272-3.

³ *Tenure of Land in the East Africa Protectorate*, Cmd. 4117, 1908, p. 30.

measure of the same description proposed in 1913. The Colonial Office gave way to the pressure, and in 1915 agreed to increase the period of lease to 999 years and to restrict the control of the Governor over transfers to those between members of different races, a measure designed to prevent the sale of land to Indians.¹ The second line of attack came from other quarters; it was pointed out that the declarations constituting native reserves had so far given them no statutory recognition, and had failed to define the rights of the natives occupying them.

The Crown Lands Ordinance, which was passed in 1915, was designed to meet both the points above indicated. It provided for the issue of leases on the conditions now accepted by the Colonial Office; and, while repeating the definition of Crown lands contained in the 1902 Order, added that Crown lands were to be held to include 'all lands reserved for the use of any native tribe'. The intention of this measure, as was subsequently observed by the Commission of 1933,² was not to reduce the security of tenure in the reserves, but to allow native rights to be better safeguarded and defined; and the provision was one which, as experience has shown, would not have been open to objection had the executive treated the reserved areas as inviolable. But the settlers had never accepted the reserve policy as finally debarring Europeans from obtaining grants in the reserves, and whether the terms used in the Ordinance of 1915 had any influence on the decision or not, it is noteworthy that lands in the Lumbwa Reserve were subsequently alienated for the settlement of ex-soldiers. So far the reserves had not been formally gazetted, and the 1920 Land Tenure Commission, admitting that the allotment of reserves had followed no fixed principle, advocated a formal delimitation and suggested that it should be on a basis which would provide sufficient lands also for the next generation. The position of the Crown again came under discussion in the courts in 1921, this time on a case arising between different parties in the Kikuyu tribe, one of whom claimed to hold land in individual tenure acquired by purchase from another tribe. A decision on that issue might have tested the applicability in Kenya of some of the

¹ See Chap. VIII, p. 336.

² *Report of the Kenya Land Commission*, Cmd. 4556, 1934, para. 1635.

principles enunciated by the Privy Council in the Southern Rhodesia case,¹ but this suit, like that of the Masai, was also decided on the technical ground of lack of jurisdiction. All private rights were held to have disappeared by virtue of the declaration of 1915 vesting the reserves in the Crown.² The court added that the legal position of the native in the reserves was that of a tenant at will of the Crown, a somewhat unfortunate instance of the application of terms of English law to a situation which had no real parallel in that law.

There were no alienations of any considerable extent after 1919, but the justifiable feeling of insecurity among the natives regarding their rights in the reserves impressed the East Africa Commission of 1924. It found that cases had occurred, such as the excision of a large area in the Nandi reserve, where the Governor had either not reported his action to the Secretary of State or had done so later when it was not practicable to reverse the action taken.³ As a result of the Commission's recommendations the formal gazettement of the reserves followed in 1926. The area which these operations left for the purpose of European settlement was about 16,000 square miles; the area of the reserves assigned to the natives in the neighbourhood of the highlands amounted to about 43,500 square miles. The whole area of the colony is 224,960 square miles; but the proportion borne by the area thus practically withdrawn for European settlement to the total area of the colony does not afford a measure of the local disturbance caused. There are in the neighbourhood of the highlands some areas which have a high density of population; that in the Kikuyu reserve averages 283 per square mile, and in the Kavirondo reserve 145; while, on the other hand, areas unaffected by the reserve policy, such as the Northern Frontier province, have an average density of less than one per square mile. The British Government at the time seems to have been less concerned with the result of this operation than with the issue whether Indians should be entitled to take up land in the highland area, a matter which has been dealt with in an earlier chapter.⁴ It should be noticed that while the British Government had assented to the

¹ See above, p. 733.

³ *Report*, Cmd. 2837, 1925, p. 29.

⁴ See Chap. VIII, p. 336.

steps taken to constitute the native reserves, there had up to this time been no declaration by it that the rest of the highland area would be permanently reserved for European settlement.

In 1929 the Commission on Closer Union in East Africa¹ expressed itself, like the East Africa Commission of 1924, as strongly impressed with the necessity for giving natives some effective guarantee of the security of their tenure of their reserves. A draft ordinance of 1928 had proposed to create a local Lands Trust Board in which the reserves should be vested; the substitution of such a Board, created by local ordinance, for the independent trust created by Order in Council in Southern Rhodesia was criticized in England, and the fact that the ordinance proposed to make it possible for the administration to alienate areas within the reserves for white occupation, where they considered this beneficial to natives, was also criticized by some members of the commission² as introducing a further element of insecurity. The revised ordinance which was put forward in 1930 as the result of these criticisms dealt with the question of security by a declaration that the reserves were 'set aside for the benefit of the native tribes for ever', and placed them under a Native Lands Trust Board consisting of government officials, and two non-official members of the legislative council, one of whom would represent native interests.

The question of the sufficiency of the area in the reserves had, perhaps, hitherto been subordinated to the question of the security of their tenure, but the Joint Select Committee of Parliament, which dealt with the report of the Commission on Closer Union,³ required in 1931 that an authoritative inquiry should be made, not only into the adequacy of the security afforded by the Lands Trust Ordinance of 1930, but into the present and prospective needs of the natives in the matter of land. The Land Commission appointed in 1933 to carry out this recommendation was presided over by Sir Morris Carter; its report, issued in 1934, is an important contribution to the study of the land questions in Kenya.⁴ In regard to the question of area, it proposed an addition

¹ *Report*, Cmd. 3234, pp. 43-4.

² *Ibid.*, pp. 350-2.

³ H.C. 156, 1931, p. 44.

⁴ *Report*, op. cit., Cmd. 4556, 1934.

to the existing reserves of 2,629 square miles, of which 1,474 were allotted in satisfaction of claims of right, 896 on grounds of economic need, and 259 as temporary reserves to be held on lease terminable by the government. The needs of advanced natives for land to be held on a more individual form of tenure than is at present possible in the native reserves were to be met by the provision of 939 square miles open for leasing by them. The total area finally reserved for natives would thus be about 50,000 square miles.

The Commission had in addition been required to define the limits of the highlands, in which Europeans 'are to have a privileged position in accordance with the White Paper of 1923'. It recommended the demarcation of certain boundary lines to embrace an area of 16,700 square miles, of which 3,950 were forest reserve, and in order to provide the European community with a guarantee that the area would not be invaded by non-Europeans, it proposed that the boundaries should be laid down by Order in Council. The recommendations of the Commission have been much criticized, particularly in regard to the extent of the area to be added to the reserves, and it may be permissible to give here certain general conclusions which an independent study of the available evidence seems to justify. A large part of the area reserved for Europeans was not in any real sense occupied by natives in 1900, and the delimitation of the reserves deprived tribes of a relatively small area which could be said to have been actually held by them. On the other hand, the reservation of this area for Europeans prevented the expansion by which the more populous tribes would normally have sought relief from congestion, while at the same time the improvement of the economic situation, the growth of communications and the like, introduced conditions which inevitably tended to make the population more congested. It, of course, remains a matter of speculation whether tribes such as the Kikuyu would have been allowed by their more warlike neighbours to expand, or whether they would have been forced to seek the traditional African remedy of migration; it is, however, certain that the reservation of the highland area for Europeans eliminated one possible means of adjustment.

For the tribes, the most important of the issues with which the

Land Commission dealt was not the adjustment of claims of right, but the possibility of satisfying their economic needs by providing larger areas for their occupation; the Commission, however, clearly felt itself precluded from making any recommendation which would involve a material reduction in the area which Europeans had desired to see reserved. Their report appears to have proceeded on the assumption that the highland area which they were instructed to define was one to which Europeans had a claim as of right, whereas the determination of its limits was in fact a matter of policy. At the time when the Commission reported, the actual area alienated to Europeans was 10,345 square miles, of which 11·8 per cent. was cultivated, 40·7 per cent. used for stock, 20 per cent. occupied by native squatters, and 27·5 per cent. not in use. The margin between the 16,700 square miles which were eventually defined by the Commission as reserved for European occupation and that already held by settlers was therefore considerable; there was an even greater disproportion between the area reserved and that in beneficial use; nor are the considerations which these facts suggest seriously affected by the fact that some of the unalienated land is occupied by forest reserves which will probably be maintained as such indefinitely.

On the second question, that of security, the Commission was not working under the same restraint. While it was still taking evidence, the measures adopted on the discovery of gold at Kakamega, in the well-populated Kavirondo reserve, once more aroused public interest in the nature of the guarantees afforded by the Native Lands Trust Ordinance of 1930. The mining rights had from the first been reserved to the Crown; a difficulty, however, arose regarding the surface rights on land required for mining. Under section 15 of the Ordinance, government could, with the consent of the Central Lands Trust Board, and with the sanction of the Secretary of State if the area exceeded 200 acres and the Local Native Council objected to the proposal, exclude the area from the reserve on condition that it provided equivalent land elsewhere; or alternatively, under section 8, if it could be shown to be directly in the interests of the natives to do so, it could give to the mining interest a lease of the land up to thirty-three years, or with the sanction of the Secretary of State up to ninety-nine years.

Uncertain at the outset of the extent of land which might eventually be required, and for how long a period, the Kenya government did not desire to resort to permanent exclusion; on the other hand, land was required for other than the transient purposes for which leases were contemplated by the ordinance. A new ordinance¹ was therefore passed providing that land covered by a mining lease might be temporarily excluded from the reserve, during the currency of the lease, without any provision of equivalent land elsewhere, and enabling government to take this step without reference to the Local Native Council. Compensation was, however, to be given, the sums due being paid to the Native Trust fund.

The Commission was asked for its opinion on these proceedings, and while not objecting to the ordinance as a temporary measure, considered that the principle of the 1930 Ordinance should have been preserved, and land given in exchange for the areas 'excluded', the exchange being temporary or permanent as circumstances might determine. It is certainly to be regretted that an exchange of land was not offered from the first, for in the event it proved that the area required was not considerable, and government would have avoided the reproach, which on the facts it did not merit, that it was seeking to undermine the security afforded by the 1930 ordinance. The incident assumed an importance greater than was justified by the dislocation caused; indeed, the question of the small area actually affected is not that to which native opinion would seem to attach most importance. The real trouble, as is probably clear to the intelligent African, lies in the fact that the Mining Ordinance of 1931, by opening reserves to general prospecting with all its attendant consequences, may in some circumstances constitute a dislocation in the conditions of the reserve more far-reaching than the loss of a small area of land.

When the Commission came to deal with the question of security it recommended that lands gazetted as reserves should be termed 'Native', not 'Crown', lands; that native lands should be vested in a Native Lands Trust Board which had no administrative but only protective functions, and was so constituted as to be removed from the sphere of local politics; it should not, therefore, contain

¹ Native Lands Trust Amendment Ordinance, 1932.

officials nor, if possible, non-officials who are members of the executive or legislative councils.¹ This would seem to suggest that the Board should sit in England, though only one member of the Commission definitely recommended this. It was considered that the enactment of the necessary regulations by an Order in Council would afford a greater guarantee than the passing of an ordinance by the local legislature; the point taken is, perhaps, one which derives its importance from previous circumstances in Kenya rather than from general considerations, since any modification made by a local legislature would require the assent of the Secretary of State. The Commission further recommended that local questions regarding the reserve lands should be dealt with by local Land Boards consisting of natives presided over by the District Officer; as regards the grant of leases in the reserves, which were permitted by the 1930 Ordinance over an undefined area up to periods of thirty-three years, or, with the sanction of the Secretary of State, up to ninety-nine years, the commission considered that any lease exceeding ten acres should be approved by the Trust Board after consulting the local Land Boards; it was of opinion that in the proposed native leasehold areas leases should be allowed to non-natives for any purpose in the native interest in order to assist development.²

Proposals of a similar kind had, as has been mentioned, attracted the notice of the Commission on Closer Union; and critics have objected that a long-term lease for purposes which necessarily involve considerable expenditure would not be easy of resumption, and would thus in effect amount to the expropriation of native lands. The propriety of the grant of such leases, however, must clearly be a question which depends rather on local circumstances in each case than on any general principle. When land is needed for public purposes, or for mining or industrial requirements, the Commission advised that the usual procedure should not be to exclude the area from the reserve, but that it should be 'set apart' and an annual payment for it made to the Local Native Council. The consent of the Local Native Council and the local Land Board would be required, and the Lands Trust Board would have power

¹ *Report*, op. cit., Cmd. 4556, 1934, paras. 1693, 1793, 1817.

² *Ibid.*, paras. 1467, 1541.

to veto any proposal to 'set apart' an area over ten acres. Exclusion would remain a possibility, to be resorted to only if in the opinion of the Governor it was essential in the public interest.

The British Government have accepted these recommendations in principle, save that regarding the establishment of the Native Lands Trust Board in London, which they considered to be unworkable in practice;¹ but the Order in Council giving effect to their decisions had not been issued by the end of 1937. As regards mining leases, however, certain proposals by the Commission were put into effect in 1934 by an amendment to the Native Lands Trust Ordinance, 1930. Land required for mining may be temporarily excluded from the reserve by the Governor with the consent of the Local Native Council and the occupants, who have the right to receive compensation and accommodation in an area of equal size and value which must be added to the reserve for the duration of the lease. Alternatively, land not exceeding ten acres in area may be set apart for mining, subject to the approval of the local Land Board; applications to set apart larger areas are dealt with by the central Board, and in all cases the natives concerned are to be given an opportunity to express their opinion, while compensation for disturbances and rental is to be paid by the leaseholder. Alienation of land in the highlands continues to be restricted to Europeans by administrative action and by the provision in the Crown Lands Ordinance of 1915 which requires government approval to transfers of land between members of different races.

The problem of squatter labour in Kenya has already been referred to.² Planters, in the main, desire the continuance of a system which provides a supply of cheap labour, but stock-owners generally are opposed to it, as they fear the growth in numbers and the illicit movement of the squatters' cattle. The chief evils attendant on the system are said to be connected with the increase of squatter stock, the removal of large numbers of natives from tribal restraint, and the poor quality of their work. The Agricultural Census of 1934 gave the total number of squatters as 114,440, and it was estimated that in the Uasin-Gishu and Trans-Nzoia

¹ *Kenya Land Commission Report: Summary of Conclusions reached by His Majesty's Government*, Cmd. 4580, 1934.

² See Chap. IX, p. 384.

districts alone squatters owned nearly 130,000 head of cattle. The Resident Native Labourers' Ordinance of 1925 had for its aim the encouragement of native labour on farms. The report of a committee of 1934 on the working of this Ordinance recommended a new ordinance,¹ since approved in draft by the Secretary of State, which extends the period of contract from three to five years, allows squatters who have completed the 180 days' work for their employers to engage in work elsewhere, tightens up the regulations for the control of squatters' cattle, and provides machinery for the removal of squatters from areas which are not considered to be under effective control. At the same time it is recognized that the removal of squatters and their cattle in any large numbers to the reserves would result in overcrowding and the increase of erosion.

(h) *Nyasaland*

The history of land rights in Nyasaland has taken an entirely different course from that in Kenya. At an early date climatic and other conditions seemed to point to the country as a suitable area for European settlement, and about 1884 companies and individual settlers began to acquire land by purchase from native chiefs. Some of the concessions were of considerable extent; that held by the British South Africa Company included the greater part of the present Northern Nyasa district; and there were others, such as those held by the British Central Africa Company, the A. L. Bruce Trust, the United Free Church of Scotland, and the African Lakes Corporation, which were of very considerable size. When a protectorate was declared in 1891 the Crown took power to regularize these transactions, issuing 'certificates of claim' to those who could prove lengthy occupation together with development of the land, or authentic purchase from recognized chiefs on reasonable terms; but it was a usual condition that such titles were held subject to the rights of the native population, a large number of which was living in the alienated areas.² It is noteworthy that Sir Harry Johnston,³ when issuing the certificates of

¹ The Resident Labourers' Ordinance, 1935.

² *Report of a Commission on the Occupation of Land*, 1921, p. 12.

³ *British Central Africa*, 1898, p. 113.

claim, admitted that it was doubtful if the chiefs could be said to have power to alienate tribal lands. The concessions covered over 15 per cent. of the total area of the protectorate, and their validity was vigorously contested by the successors of the chiefs who had made them.

When the claims to title had been settled, agreements were made by government with all the chiefs in the protectorate, securing it the control over the remaining lands, henceforth known as Crown lands, and withdrawing from the chiefs the power of further alienation. The area in which claims were held to be good and for which certificates were granted stood originally at 1,018,792 acres, or including the British South Africa freehold of 2,773,260 acres in North Nyasa District, a total of 3,792,052 acres. Subsequent acquisitions by government, fresh alienations in the southern districts, and the withdrawal of the British South Africa Company from its surface rights in northern Nyasa, in substitution for mineral rights, have left a total of 1,303,219 acres alienated, or approximately 5 per cent. of the territory's area. Of the alienated area 72·3 per cent. is in the hands of eleven large estate holders.

Though the area thus obtained from natives was large, the process of settlement by Europeans was slow, and there was never the same 'settler' question as in Kenya. The lands alienated by the Crown in the southern districts, under the terms of Ordinance 18 of 1912, though small in comparison with those held under certificate of claim, served to increase certain problems which the latter had always presented. These arose from the presence of large numbers of native residents on the alienated lands, a problem which, as will have been seen, had occurred also in regard to the Chartered Company's lands in Northern Rhodesia, and had there been met by the creation of reserves. Some of the estate holders in the Nyasaland highlands claimed that as successors to the native chiefs they had the right to demand the customary compulsory labour both from the original tenants and from immigrants from Portuguese territory who had squatted on their lands; the 1931 census showed that 14·7 per cent. of the population had come from Portuguese territory. The situation was reported on by a local commission in 1921.¹ This body was opposed to the delimita-

¹ *Report*, op. cit., p. 5.

tion of European and native areas on the lines which had been followed elsewhere: it held that any restriction of the land in native occupation would seriously prejudice the welfare of communities who are obliged, owing to shortage of water and other local circumstances, to live in scattered villages. It preferred to recommend the assignment of limited areas for European settlement, after the fullest provision for natives had been made.

The East Africa Commission of 1924-5¹ suggested that blocks of the alienated estates should be redeemed by government from a fund formed by a tax on freeholds. Impressed, as in Kenya, with the feeling of insecurity among natives regarding the tenure of their lands, it recommended the constitution of a Native Lands Trust Board, and an ordinance for this purpose was introduced in 1927; at the same time certain areas were gazetted as 'Crown lands required for the settlement of natives', and excluded from alienation under the authority of the Ordinance of 1912. It would seem, however, that policy was as yet in fact undecided, for opinions continued to be expressed, as in 1921, against the reserve policy, towards which the proceedings of 1926-7 seemed to tend. Ultimately a solution was found which seems to have been inspired by the policy of Nigeria or Tanganyika rather than by the principle of segregation favoured farther south. The Native Trust Land Order in Council of 1936 divides the territory into Crown lands (now limited to those acquired for strictly public purposes), reserved lands (that is, lands included in townships, forest reserves, and lands already alienated), and native trust land, which includes the great bulk of what was previously classed as Crown lands. The native trust lands will vest in the Secretary of State and will be administered 'for the benefit of the native inhabitants'. With no intention of subordinating the interests of the native majority to those of the European minority, it was nevertheless felt that a certain amount of European development was of benefit to natives, and the law made provision for alienations for this purpose, to be made after consulting native authorities and limited to leases of ninety-nine years. It will be realized that the policy embodied in the law was one to which the reduction in the demand for land by Europeans had largely contributed.

¹ *Report*, Cmd. 2387, p. 111.

The problem of the rights of natives on alienated lands mainly affected the Blantyre and Zomba Districts; in 1921 half the population of the former and one-quarter of the latter were living on European estates, and a system known as 'tangata' prevailed whereby the native tenant worked for the landowner, or grew crops over which the landowner had a right of purchase, instead of paying a cash rent. Under the terms of the certificates of claim, villages which existed when title was granted could not be required to move; but difficulties arose both in deciding which were the original villages to which these rights applied, and in defining the terms on which residents were entitled to cultivate land for their own subsistence. At an earlier stage landholders had pressed for rent, though in a decision in 1903¹ the High Court decided that rent could not legally be exacted from original residents, and the Chilembwe rising of 1915 was held to be partly due to the levy of rent on their lands. As tobacco cultivation extended, the position of the landlords changed: they now preferred to obtain labour from the resident rightholders rather than to receive rent. Legislation passed in 1904 and again in 1917² did not seem to supply a remedy, and the Land Commission of 1921³ and the East Africa Commission of 1924-5⁴ both made recommendations on the subject.

Fresh efforts were made to find a solution in the Natives on Private Estates Ordinance of 1928, a complicated measure which in effect embodied the 'tangata' system and gave the native tenant on European lands the right to work for wages in abatement of rent, or, if work was not available, to receive facilities for growing economic crops, of which the landholder had to purchase sufficient at current market prices to entitle the native to a rebate of rent. This represented an attempted compromise between the claims of the two parties; but economic conditions, particularly during the depression, made the provisions difficult of adoption in practice; the law was at all events so far from proving a solution that a committee of the legislature considered the matter again in 1934.

² Lands Ordinance (Native Locations), 1904; Native Rents (Private Estates) Ordinance, 1917.

³ *Report*, op. cit., pp. 15-20.

⁴ *Report*, Cmd. 2387, p. 111.

There has been no lack of goodwill in attempting the solution of a very difficult problem, which is complicated by the fact that large numbers of immigrants are now resident on these lands, in addition to the descendants of original rightholders. The clear-cut solution of assigning separate areas for the occupation of native rightholders is difficult in most cases, though perhaps not in all; but some modification of the present situation seems necessary if the estate holders are to be in a position to make full use of their lands. Their inability to do so is an economic loss to the community at large, for the northern parts of the protectorate, as the Committee on Emigrant Labour of 1935¹ has shown, have a surplus of labour which can find no employment within the territory.

(i) *Uganda*

The question of land rights in Uganda has been influenced in even less degree by a policy of colonization, though the country was originally regarded as suited for European enterprise.² But the early treatment of the land question is interesting, for it reveals the steps by which the British Government gradually came to a definite opinion as to its legal powers over land in areas held under a protectorate. The agreement made by the British East Africa Company with the Kabaka in 1892 bound the latter not to alienate rights over land to Europeans without its consent. In 1894 the Crown still held, as in the case of Bechuanaland,³ that the declaration of a protectorate gave it no legal powers over the control of land. When in 1895 it was decided to build the railway to Uganda, the necessary powers to acquire land were secured by the application to Uganda of the Indian Land Acquisition Act of 1894; and land was secured for traders by the issue of certificates of occupancy for twenty-one years. Land Regulations were issued in 1897 enacting that land obtained from chiefs would not be considered to be lawfully held unless the transaction had been registered by government. All these steps were clearly insufficient to allow adequate control over the land generally, and in 1899 the British Government, after reference to the law officers of the Crown, finally

¹ *Report*, 1936, para. 130. Cf. Chap. XI, pp. 638, 648.

² M. T. Dawe, *Report on Botanical Mission in Uganda*, 1906.

³ See above, pp. 730-1.

decided that it could claim control over waste or unoccupied land in those protectorates where there was no settled form of government, and where land had not been appropriated either to the Sovereign or to individuals. It must be realized that the legal advisers of the British government were faced at the time with the difficulty of framing a definition of the protectorate powers of the Crown which would fit conditions differing as widely as those of Zanzibar and Central Africa, and if the view taken by them in 1899 did not give to the Crown all the powers which, as the Privy Council report in the Southern Rhodesia case¹ subsequently showed, it might legally have claimed, it appeared at the time to meet the needs of a somewhat complicated situation. It had the disadvantage, however, that it still left the authorities of the day to decide what was a settled form of government and what was unoccupied land. It will be seen from what is said elsewhere that the restrictions which legal advice then placed on the powers of the Crown have disappeared; the theory of law on which the Nigeria or Tanganyika land statutes are based gives the Crown full rights over lands, restricted only by the needs of the native population.

The terms of the Uganda Agreement of March 10, 1900, reflect the view taken in 1899; it was held that more than any tract between the coast and the Congo, Buganda fell within the category of a 'settled government', and the agreement was negotiated on the assumption, which was in principle correct, that all the unoccupied land of Buganda was in the gift of the Kabaka. A few months later agreements were made with the Mukama and chiefs of Toro, and in 1901 with the Mugabe of Ankole; but it was not felt that there was in these territories a settled government having the same powers as the Kabaka of Buganda. The Uganda Agreement reserved a large area, subsequently surveyed as 9,003 square miles, for the benefit of the ruler and his chiefs, numbering in all about 3,700 persons. The land was not considered as a grant, but as property to which the Crown had no claim; thus land falling into escheat would be dealt with by the Governor and the Native Council 'as trustees for the Baganda'.² The 9,003 square miles constituted the Buganda Mailo lands subsequently

¹ See above, p. 733.

² Native Land Law of 1908.

referred to, and the distribution of these lands was left to the Kabaka and his chiefs. The agreement explicitly vested all the remaining Buganda lands, forests, &c., in the Uganda administration. The Toro and Ankole Agreements merely stated that all 'waste and uncultivated lands' would belong to the British Government; in their case only small areas were granted to the rulers and a few prominent chiefs.

In 1902, as the result of a further consideration of the legal consequences flowing from the assumption of a protectorate, the British Government took a more enlarged view of its powers, and defined its position in regard to land in the Uganda Order in Council of that year. This order was in the same terms as the East Africa Order of the same year, and contained the same definition of Crown lands¹ as in that order, with the same implication that the 'public' lands referred to were the unoccupied lands, over which it was now accepted that the protectorate had powers of control. The Crown Lands Ordinance of 1903 detailed the terms upon which the rights conferred by the 1902 Order would be exercised, and by an amending ordinance of 1910, intended to pave the way for European enterprise, it was laid down that the administration could sell or lease Crown lands on which there were natives, but that natives actually in occupation could continue there as of right until arrangements had been made for their removal or for the payment of compensation, after which they would be tenants at will. That the use of the powers thus claimed over all Uganda lands, other than those preserved under the agreements, did not involve difficulties to the same extent as in Kenya, is due to the fact that the areas best suited for colonization had been withdrawn from Uganda and transferred to Kenya in 1902; while freehold alienations in other areas, which proceeded slowly till 1916, were then suspended, it being announced that future concessions would be in leasehold. The decision was influenced by the fact that with the expansion in the growth of cotton, economic development was increasingly based on native peasant cultivation. Out of the total area of 80,371 square miles in Uganda, excluding open water, 9,627 square miles represent the areas left with chiefs and others under the Agreements of

¹ See above, p. 744.

1900 and 1901; of the total area less than 500 square miles are in non-native hands, and of this area only 115 square miles of freehold and 61 of leasehold represent alienations by the Crown, the rest having been purchased from natives of Buganda after the 1900 Agreement.

The powers of the Crown over land are now regulated by the Crown Lands Declaration of 1922. Based on the Ordinance of 1903, it renders the position of the Crown unassailable in regard to all lands in which it has not granted title. The main problems of the administration, however, have not been connected with the Crown lands, but with the Mailo lands constituted under the Agreement of 1900. In Buganda the political system introduced by the Bahima conquerors, of Hamitic origin, had involved an organization of a feudal character, and the chiefs and notables had held their lands under various forms of customary right and service tenures. The recognition of a proprietary right in the lands allotted to the chief introduced a usage foreign to the native system and created a series of issues all the more embarrassing because of their novelty in African conditions. With the growth of commercial crops, the position of landlord assumed an importance it could not possess in a subsistence economy; he tended to become a rent-farmer, instead of an authority exercising feudal or service rights. Again, the grant of the proprietary right had overlooked the well-established rights of the Bataka, the clan chiefs who were the accepted guardians of the clan burial lands.¹ In passing the Land Law of 1908 the Buganda Council, the Lukiko, disregarded the rights of these Bataka, and the British Government in vain attempted to secure a recognition of their rights; the Lukiko was composed of chiefs who were personally interested, and the hands of the British Government were tied by the terms of the Agreement of 1900. The Buganda Land Law (Survey) of 1909 provided for the issue of provisional certificates pending the completion of a survey, and in 1913 the Buganda Agreement (Allotment and Survey) was concluded in order to adjust discrepancies revealed by the survey.

A further attempt to define individual rights resulted in Ordinance 22 of 1922, which provided for the registration of title in

¹ L. P. Mair, *An African People in the Twentieth Century*, 1934, p. 162.

the Mailo lands with a guarantee of indefeasibility. This, in effect, was a grant of fee simple, the form of registration adopted being that of the Torrens system.¹ The position of the actual cultivators, the Bakopi, in relation to the persons now recognized as proprietors of the Mailo lands, presented a problem of increasing difficulty, and in 1926 the government required the Lukiko to pass a law² restricting the landowners' right of dispossession and laying down fixed rates for rents and charges on commercial crops, perhaps the first legislative enactment in Africa dealing with native rental conditions. The Bunyoro Agreement of 1933 declared that the territories comprised within Bunyoro Kitara are held by the Governor for the occupation and use of the natives, but the right of government to grant a valid title to individuals is reserved. Largely by the aid of the profits of cotton cultivation, the Buganda peasant has lately succeeded in re-establishing his position by the purchase of Mailo lands; the transactions already exceed 20,000 in number, and many of the larger estates have been broken up. Within the area affected by the Buganda Agreement, the survey of the Mailo lands, the registration of the numerous transfers of title involved, the questions arising from the fragmentation and sub-division of holdings are the main land problems of to-day in Uganda, with the possibility of fresh problems in the future arising in regard to the control of credit operations based on land. Outside of the agreement areas, the government has still to deal with those fundamental questions regarding the nature of the rights attaching to the occupation of land under native customary law which are discussed later in this chapter.³

(j) *Tanganyika*

In Tanganyika policy was at one time dictated by the need of meeting demands for land for European enterprise, but has now come under other influences. The Germans from the first adopted a policy of development by European capital, but its objective was the exploitation of products rather than large-scale white settlement. The imperial Decree of November 26, 1895, declared that all land in the German East Africa Protectorates was Crown

¹ See below, pp. 876 ff.

² Buganda, Busulu, and Envujo Law, 1927.

³ See below, pp. 829 ff.

land, but added that the right of the Crown was subject to the rights of private and juristic persons or of chiefs and native communities; in taking possession of Crown land in the vicinity of native communities areas were to be reserved which would secure to the natives enough land for cultivation, taking into consideration future population increases. Land commissions were appointed to determine the area which should be set aside, and a local ordinance required the commissions to reserve for the natives at least four times the amount of land under cultivation.¹ Though some 175 areas in the north-eastern highlands were tentatively declared reserved, no systematic delimitation took place, and it is clear that in this region dispossession took place to an extent that dangerously reduced the areas cultivated by the local tribes. That more land had been alienated in this locality than was desirable was, indeed, admitted by the Germans, and steps were taken to prevent further allotment.

The Mandate under which the British Government succeeded laid down in Article 6 that, in the framing of laws relating to the holding or transfer of land, the mandatory should take into consideration native laws and customs, and respect the rights and safeguard the interests of the native population; no rights were to be created in favour of non-natives without the previous consent of the public authorities. The Tanganyika Order in Council, 1920, vests the land of the territory in the Governor, and the Land Ordinance, cap. 68 of the Laws, originally enacted in 1923, followed a model which, as will be seen, had been adopted in Northern Nigeria.² It declared the whole of the lands of the territory, whether occupied or unoccupied, with the exception of lands over which title had already been acquired, to be public lands under the control and subject to the disposition of the Governor, to be held and administered for the use and common benefit, direct or indirect, of the natives of the territory, and no title to the occupation and use of any such lands was to be valid without his consent. Title would henceforth take the form of a certificate granting a right of occupancy for not more than ninety-nine years; such titles could be granted to natives and non-natives;

¹ Ordinance of December 4, 1896, *Landesgesetzgebung*.

² See below, p. 773.

and could be revoked under certain conditions defined in the Ordinance.

The form in which these powers were taken was dictated by the desire to acquire a control which, while allowing such tenures among natives as is customary under their law, would enable government to intervene to prevent alienations to non-natives. The fact that the Ordinance did not specifically require that the Crown when making alienations should respect native occupation caused it to be compared unfavourably in some quarters with the German decree above quoted; but the guarantee for the respect of native rights lay in the terms of the mandate, and in the fact that the administration, as shown by the preamble of the Ordinance, regarded the law as explicitly designed to maintain the existing customary rights of natives in the land. Some difficulty was also felt in the fact that the Ordinance made the validity of a title depend on its grant or recognition by government, since this would appear to prejudice rights depending on customary occupation. In its reference to titles the Ordinance clearly had in view titles acquired by non-natives, but to meet this point a subsequent ordinance¹ defined a right of occupancy so as to include the title of a native or native community using or occupying land in accordance with native law or custom. A further apprehension was expressed by the Permanent Mandates Commission as to the possibility that the powers given to the Governor to revoke a title to occupancy might be used to interfere with rights obtained from customary occupation; this was met by a declaration that the conditions regarding the revocability of rights of occupancy did not apply to native customary rights.²

The alienations made by the German Government were large; the titles over a total area of 1,922,700 acres were recognized by the mandatory government, but the estates, with the exception of a few which were taken over by government in native interests, were sold by auction in the course of proceedings connected with the War liquidations. The extent of these alienations had left a legacy of suspicion among the tribes on all questions connected with the land, and at the outset there appears to have been some

¹ Ordinance 7 of 1928; see *Laws*, cap. 68, sect. ii.

² *Annual Report to the League of Nations on Tanganyika Territory*, 1932, p. 146.

doubt in the mind of the mandatory power whether circumstances justified an extension of European settlement. Partly as the result of events in Kenya, to which reference has already been made, partly as the result of discussions following the issue of the mandates, the general question of the policy to be observed by administrations in regard to native lands in East Africa attracted at the time much attention both in England and in Africa. The Kenya White Paper of 1923¹ had emphasized the duty of trusteeship for the native population as the basis of the position of Great Britain in East Africa. The East Africa Commission of 1925,² in discussing the implications of this declaration, referred to Lord Lugard's interpretation of trusteeship as a dual charge, involving responsibility not only for the advance of the African, but for the development of the resources of the continent for the benefit of civilization at large. It examined in some detail the position in regard to land in East Africa, and, while holding that Tanganyika was mainly suited to native production, pointed out that the highlands of the north-east and south-west of the territory had areas well suited for non-native enterprise.

The settlers who had purchased the ex-enemy lands in Tanganyika urged the government to encourage the investment of capital for the development of the country; the interests concerned in the future of the coffee industry advocated the transfer to Kenya of the areas round Kilimanjaro.³ Later, in a series of meetings, such as those held at Tukuyu in Tanganyika in 1925 and in the following year at Livingstone, the East African settlers pressed on the government the policy of expanding European settlement throughout East Africa, as an alternative to what they described as the West Coast theory of fostering a purely native civilization. The other side of the case was put by a conference of local administrative officers held at Dar-es-Salaam in 1924, which pointed to the difficulty already experienced in obtaining labour for European estates, and was opposed to further alienation of land for non-native development. The government, without at that stage committing itself to any clearly defined policy, indicated that it was prepared to encourage non-native settlement on a limited scale in areas not

¹ Cmd. 1922, 1923; see Chap. V, p. 135.

² Cmd. 2387, 1925, pp. 22-3, 116.

³ *Ibid.*, p. 123.

affected by the German alienations, and in 1924 disposed of 17,000 acres in the southern part of the territory.

The wider aspects of the land question came under discussion at the Conference of Governors of the East African Dependencies in 1926. The view there held was that while lands effectively occupied by a large and settled native population should be reserved for its exclusive use, lands which were largely jungle or forest, or on which there was only a doubtful title, 'the lands of the spear', should be developed in the most effective manner by government, on the condition, however, that sufficient land for their own use should be secured to the native tribes originally scattered or wandering over it. On such lands European colonization should be encouraged wherever the climate was suitable, and adequate areas were available for settlement without depriving the existing native population of sufficient land for its own use. Land policy had by this time been so far stabilized in Kenya, Nyasaland, and Uganda that the particular interest of these recommendations lay in their bearing on Tanganyika; it is noteworthy that in acceding to them the Governor of Tanganyika at the same time explicitly repudiated the reserve policy.

The reaffirmation of these principles by the Governor, in his address to the first session of the Tanganyika legislative council in 1926, was followed by the gazetting of an offer of 40,000 acres for sale in the Iringa district. Policy was, however, clearly turning more definitely towards the recognition of the need for making a fuller study of the actual situation in the matter of land, and in 1927 a Land Development Survey was instituted, in order to make a comprehensive investigation both of native needs and the economic possibilities of European settlement. This survey approached the *subject along different lines from those adopted by some other colonial land commissions*; the satisfaction of native requirements was postulated as a condition precedent to the release of land for other purposes. It is not possible, as yet, to schedule the complete figures of the areas which are proposed to be thrown open or to be closed to settlement, nor are they for the moment important; in view of the decrease in applications for land by Europeans and of the surrender of farms during the depression period, alienation has since been confined to a small area in the Northern Province.

Moreover, five provinces were closed entirely in 1930, not on economic grounds, but with 'a view to preserving racial homogeneity'; in those areas non-natives will only be allowed to settle if in possession of sufficient capital to undertake operations on an adequate scale, especially in connexion with water supplies. In all, however, only some 786,040 acres have been alienated by the mandatory government, and the total area held by non-natives (including the 3,000 square miles of German grants) amounts to about 4,232 square miles out of a total land area of 339,900 square miles in the territory.

(k) *Nigeria*

In passing over to the British West African colonies and protectorates, it is at once apparent that policy has been little influenced by the pressure of demands for colonization. Here the chief problem before the administrations has been the regulation of concessions for the exploitation of mineral or forest products. Taking Nigeria in the first place, it is necessary to draw a distinction between the Colony and the Protectorate, and within the latter to discriminate between the southern and the northern provinces. The small area in the colony only justifies mention on account of the position it has occupied in the legal history of colonial land rights. Extensive grants of land, under titles stamped by the British Consul, were made by the local King Docemo before the cession of Lagos in 1861. In 1863 the British Government regularized the situation by calling in these titles and issuing Crown grants to natives claiming land. Lands held under Crown grants have since been freely alienated in terms of English law, but the imposition of English conceptions of property law upon native custom has resulted in a confused blending of elements derived from both sources. Though transfer follows English forms, it is subject to all the vagaries of inexpert conveyance, and the courts have held that the native law of family property, particularly in the matter of inheritance, prevails even in lands held under Crown grants.

For the present purpose, however, interest centres in the lands which are not subject to Crown grant, being still held in communal tenure. The Privy Council decided in 1915¹ that these areas had

¹ *Attorney-General of Southern Nigeria and John Holt & Co., Liverpool Ltd* (1915), A.C. 599.

been ceded to the Crown in 1861, subject to the condition that all rights existing in the inhabitants by grant or otherwise from King Docemo, or his predecessors, would have to be respected. The nature of these rights was determined in the Apapa case of 1921,¹ in which the Privy Council arrived at a decision which is noteworthy in that it differs in an important point from the view held in the Southern Rhodesian case.² In both cases the Council proceeded on the principle that rights of ownership are not disturbed by a change of sovereignty; but in the case of Lagos, unlike that of Southern Rhodesia, it found that a customary right of the nature of that existing locally, though a right of a communal nature, could be recognized as a private right to be respected and upheld. The Crown in consequence has only a negligible interest in the lands in the colony.

In the areas comprised in the former Southern Nigeria Protectorate, now the Southern Provinces, the Crown has taken the view that the authority derived from the treaties made with native chiefs did not extend to interference with rights over land. The Royal Niger Company had acquired land rights by various treaties made in the area it controlled, and these were taken over when the charter was terminated in 1900, but government, while maintaining the freehold of the Company in certain areas occupied by its trading stations³ and recognizing the validity of the concessions obtained by it over mineral rights,⁴ did not assert any claim over the native lands, holding that these were in effective native occupation. It is noteworthy that after the assumption of direct rule in Benin, following on its conquest in 1896, the Crown treated rights in the land as having passed to itself, and issued leases; but after his restoration in 1916 the Oba was allowed to resume control over land occupied by his people. In Southern Nigeria the Crown has limited itself to steps designed to control alienation by natives to non-natives; the Proclamations of 1900 and 1903, as modified in Ordinance 32 of 1917, provide that no alien shall acquire any interest in land from a native except under an instrument approved by the Governor; sales have been so authorized,

⁴ See Chap. XXII, p. 1520.

mainly in urban centres, for trading purposes, but have not been numerous. The legal position is somewhat confused by the fact that Ordinance 7 of 1918, now appearing as cap. 84 of the *Laws*, retains the definition of Crown lands as all public lands which are for the time being subject to the control of His Majesty by virtue of any treaty, cession, or agreement, or by virtue of His Majesty's Protectorate. It appears, however, that this is in practice interpreted as applying only to land acquired by escheat, purchase, and the like, and not to native lands generally.

The full recognition given to native rights in Southern Nigeria formed an issue of some importance in the discussions which originated during the War regarding the development of colonial resources. The attempts made by the Leverhulme and other interests to secure a freehold area for oil-palm plantations attracted some attention between 1920 and 1926, and the discussions on the subject in England found their echo in the expression by natives of the Southern Provinces of fears lest the government should adopt what was termed the 'Kenya system'. As long ago as 1911 alarm had been shown at the appointment of a committee to inquire into land rights in West Africa. Mr. W. Ormsby Gore, afterwards Secretary of State for the Colonies, in his report on a visit to West Africa in 1926¹ expressed himself as opposed to any system of compulsory acquisition, the use of compulsory labour, or the grant of buying monopolies, but he felt that the protectorate would have much to gain from the introduction of scientific palm cultivation on a large scale; he believed that the natives could have no objection if vacant lands were given on leasehold, the African's chief objection being to the grant of permanent rights in the land. In the attitude which government adopted it was perhaps influenced by doubt as to the value of the plantation as opposed to the peasant method of development,² but in rejecting the application it maintained the point that even a lease could not be obtained without invading fully acknowledged native rights. Since then, however, the United Africa Company has obtained long leases for some 12,400 acres for rubber and

¹ Cmd. 2744, 1926, pp. 108-9.

² 'Correspondence relating to the Policy to be adopted with regard to projected Commercial Enterprises for Cotton-growing on a large scale in the Tropical African Colonies and Protectorates', *Sessional Paper*, no. 1, 1920, Nigerian Council.

oil-palm plantations, and certain timber concessions have since been given, but they are mainly in the form of leases of land reserved under the Forest Act, or secured by agreement with native authorities.

In Northern Nigeria historical developments gave a different direction to land policy. The treaties made by the Royal Niger Company with the emirs between 1885 and 1890 gave it no general rights over land;¹ but when the charter was terminated in 1900 the Crown took immediate steps to issue a declaration of its attitude on the subject of land rights. General policy indicated the maintenance of the institutions embodied in the emirate system, and these comprised a sufficiently well defined practice in regard to land. Under a strict application of the Maliki system of Islamic law which was followed by the Fulani, all cultivated lands are on conquest treated as 'Wakf'; they may be retained by their owners on conversion to Islam, but are otherwise assigned to Moslems; land not under cultivation, including sites in cities, is at the disposal of the ruler. But this theory was not followed in practice: under the Fulani rule there remained a strong residuum of the customary native tenures. The emir confined himself to exercising rights over waste land, the *Jajin Allah*, or 'God's bush'; as regards occupied land, his control mainly took the form (as in India) of levying land revenue based on cultivation, in this case fixed at one-tenth of the produce, the Koranic '*ushur*'. The Letter of Appointment given to the emirs² stated that such rights in land as were enjoyed by the Fulani dynasty as conquerors now belonged to the Crown; the first law on the subject, Proclamation 8 of 1900, provided that no person other than a native of the protectorate should acquire land from a native without the consent of the government; and Proclamation 13 of 1902 permitted the High Commissioner to declare as public lands all lands which were the property of conquered or deposed rulers, or which were not occupied by persons having an original or derivative title under any law or custom. No grants of freehold were to be made. Such lands as were held by the Royal Niger Company, with the exception of one or two minor freeholds, were taken over in full title under

¹ See Sir E. Hertslet, *The Map of Africa by Treaty*, vol. i, 1909, pp. 128-30.

² F. D. Lugard, *Political Memoranda*, 1918, p. 344.

Proclamation 16 of 1902, but these proved to be small in area.¹

The subsequent course of land legislation in Northern Nigeria is linked up with the history of the discussions which led to the appointment of the Northern Nigeria Lands Committee, whose report was issued in 1910.² The connexion which had always existed between land tenure and taxation under the emirate system directed attention to the possibility of introducing in Northern Nigeria a tax based on land similar to the land revenue levied in India; but the course of the discussions was at the same time influenced by theories based on the principle that the state, as ultimate owner of the land, should be entitled to recover as 'economic rent' the increment represented by any increase in land values, whether due to development by the state itself or to individual enterprise. Reference will be made elsewhere³ to the inquiries made by the Committee into the nature of the tenures found to exist in the territory; it is sufficient to state here the two main conclusions at which they arrived. On the question of land rights they held that the 'ultimate ownership' of the land was vested in the chiefs and had been acquired by the British by conquest, but rights so acquired should be exercised for the use and common benefit of natives and in accordance with native custom. As regards revenue, they could find in the circumstances of the territory no theoretical basis on which economic rent could be assessed; it was contrary to native custom for the state to take rent for land, and their preference was for taking a tax of the type already introduced by the Native Revenue Proclamation, 1906—namely, one which was in principle an income tax, modified by the obligation of the landholder to develop the land to an average standard. This, as it will be realized, is not necessarily a tax based on the ultimate right of the state to dispose of land.

The action taken, as embodied in the Land and Native Rights Proclamation 9 of 1910, now standing in a modified form as Chapter 85 of the *Laws*, followed these recommendations. Whereas the intention of the previous law had been to claim for the state only the right to dispose of land not in actual occupation, and to

¹ F. D. Lugard, *Political Memoranda*, 1918, p. 348.

² Cmd. 5102, 1910.

³ See below, p. 839.

control all leases to aliens, the new law declared that all lands, whether occupied or unoccupied, were native lands subject to the disposition of the Governor, to be held and administered for the use and common benefit of the natives of Northern Nigeria. No title to the occupation and use of such lands would be valid without the consent of the Governor, who in exercising his control was to have regard to native law and custom. He was empowered, when granting a right of occupancy to natives or non-natives, to fix a rent and revise it periodically. Rights of occupancy could be for a definite or indefinite term; but no single right of occupancy granted to a non-native could exceed 1,200 acres if granted for agricultural purposes, or 12,500 if granted for grazing purposes.

The distinction between Crown and public lands thus disappeared. The assumption by the state of the 'ultimate ownership' of the land was much criticized at the time;¹ it was described in some quarters as expropriation;² others, pointing to the provision that no title to the occupation of land would be valid without the Governor's assent, claimed that this had the effect of rendering customary native occupation invalid, or alternatively would place on the administration the impossible burden of defining and registering some millions of native titles. The provision by which rent could be demanded on a right of occupancy was also strongly attacked as contrary to native law and custom. It is clear that the intention underlying the assertion of 'ultimate ownership' by the state was mainly to secure full control over alienations, and the manner in which the provision has been applied in practice is of greater importance than the legal form in which it is expressed. As regards the first point raised, the Crown has used its powers to make only a very limited number of alienations, mainly connected with the development of the tin mines. On the second point, the security of customary rights has been maintained by leaving the settlement of land disputes in the hands of the native authorities and their courts; in practice, their control is complete, subject to the power of revision exercised over all decisions of native courts.³ The native authority also deals with land transactions between natives:⁴

⁴ Regulations in Schedule 3 of Ordinance 1 of 1916.

there is no restriction on sale, transfer, or bequest to a blood relation, but the approval of the administration is needed for the transfer of land to a native not resident in the district. Finally, no rent is taken by the Crown in respect of native lands, nor is the imposition of any such charge by native authorities contemplated in the regulations. In this respect, therefore, the form adopted by the law would also appear to be of less significance than its operation in practice; it would not appear that its working has tended in any sense to invalidate customary rights, while it provides machinery for the evolution of native tenures in response to altered economic conditions. As will subsequently be shown,¹ the decision that the form of title, whether on native or non-native lands, should be one of occupancy and not freehold is of far-reaching importance in the development of African land tenures.

(1) *The British Cameroons*

In the Cameroons the system followed by the Germans was similar to that described in Tanganyika. The basic Decree of June 15, 1896, laid down that except in the case of property or other realty to which private or legal persons, chiefs or native communities could substantiate a claim, and saving the rights of third parties established by agreements with the imperial government, all land being ownerless land should be considered as Crown land. In theory this assumed that Crown land as such would eventually be demarcated, but this was never done; in practice, when Europeans made a request for land, a local Land Commission invited persons affected to state their claims; if these were established they were bought out by government, and a Crown lease was issued to the applicants. This procedure had the effect of placing the onus of proof on the native, and its mischief may be illustrated by the case of the extensive North-West Cameroon Concession, which conferred rights over all land which might at any time become Crown land—a contingent grant which the British Government did not regard as constituting a valid title. The official record (*Grundbuch*) entered as Crown property, first, those areas which were obtained by purchase or agreement before the declaration of the protectorate and were taken over by the

¹ See below, pp. 874 ff.

Crown; secondly, such unoccupied lands as had been so defined by the Land Commissions; and, thirdly, certain small areas occupied for administrative purposes. It was later realized by the German Government that their grant of concessions over extensive areas constituted an undue curtailment of native rights, and steps were taken to declare certain areas as *Reservats*, not liable to alienation, in which natives were held to have such rights as were given them by the terms of the grant or by native law and custom.

As in Tanganyika, the German estates were auctioned after the War, some fifty estates covering 258,000 acres being held to have a title justifying this action. At the first auction in London there were no offers; at a subsequent sale in 1925 the greater part were re-purchased by their former German holders. There are now 293,678 acres in German, 19,053 in British, and 260 in Swiss hands, the total alienated to non-natives being 539.4 square miles.¹ The land law of Northern Nigeria was extended to the Cameroons by the British Cameroons Administration Ordinance 1 of 1925. Under that law alienations to non-natives would take the form of leases and not of freehold.

(m) *The Gold Coast and Togoland*

In the Gold Coast, different conditions apply to the Colony, Ashanti, and the Northern Territories. In the Colony control was acquired by gradual steps, and no definite policy was evolved as to the relationship between government and the native authorities. On the whole, coastal tradition led the administration to dissociate itself from native affairs in its hinterland; the Crown was assumed to have no rights over the land, and it is characteristic that here it did not for some time take power, as it did elsewhere, to control alienation by natives to non-natives. There does not appear to have been any formal definition of native rights, but the Crown made its own position clear by provisions, such as that of the Marriage Ordinance Act, by which the lands of a native who dies intestate are distributed according to native law and do not revert to the Crown.² The position was fully accepted in

¹ *Annual Report*, 1936, p. 121.

² *Laws*, cap. 96, sect. 47. See Sir H. C. Belfield, *Report on the Legislation Governing the Alienation of Native Lands in the Gold Coast Colony and Ashanti*, Cmd. 6278, 1912, para. 23.

judgements of the local Supreme Court, which proceeded on the principle that all unoccupied land within the territory under a paramount stool belonged to such stool.¹ The needs of government for lands for public uses were met by Ordinance 8 of 1876, which provided for purchase on full consideration.

The failure to exercise an earlier control over the chiefs in their disposition of land or minerals had unfortunate results. The possibilities of the gold-fields began to attract attention about 1880, and concessions were given on a wide scale by the chiefs. In the absence of any administrative control and of any land survey which would indicate the boundaries of stool areas, great confusion ensued, and it is clear that the concessions made by chiefs did not respect the positions of individual native occupiers.² The need for some form of control was obvious, and in 1894 an ordinance was proposed, similar to the Crown Lands ordinances of other dependencies, which aimed at vesting all waste lands, forests, and minerals in the Crown. In view of the vigorous opposition which it excited it was not pressed, and in the following year government endeavoured to strengthen its case by an investigation into native land rights. This, however, produced an inconclusive report.³ A further measure (The Public Lands Bill) was put forward in 1897, but the Secretary of State, yielding to the representations of a deputation claiming to represent the majority of the chiefs, decided that it should not be proceeded with. The primary object of this Bill was to encourage permanent settlement by recognizing a right of proprietorship over land in continuous occupation: the occupier's title would be secure as against his chief, unless he abandoned the land, when it was liable to forfeiture. Opposition to this Bill came mainly from the chiefs, but they secured the assistance of the native lawyers, and it is worthy of note that the Bill was the occasion for the foundation of the Gold Coast Aborigines' Rights Protection Society.

Failing in legislation of a wider scope, the government contented itself with regulating the conditions of concessions, as between grantor and grantee, by means of the Concessions Ordinance

¹ *Wiapa v. Solomon* (1905), *Renner's Gold Coast Reports*, 1915, vol. i, part 2, p. 410.

² See Chap. IX, p. 471.

³ *Report upon the Customs Relating to the Tenure of Land in the Gold Coast*, 1895.

of 1900. By this measure, all concessions were required to be validated by the Supreme Court, which could modify their terms if conditions appeared to justify it. The procedure adopted was intended to avoid giving the impression that land transactions were to be made subject to administrative control. But the machinery thus set up proved to be seriously inadequate even for its limited purpose of sifting and validating claims, while the measure also failed to provide means of control over the action of chiefs in disposing of communal property, or over the distribution of the proceeds.¹ At the same time the disposal of an important class of cases affecting the land remained in the hands of a tribunal which, charged primarily with the duty of trying issues arising between grantor and grantee, did not possess the requisite knowledge for safeguarding the interests of the people or for fixing terms which would ensure that they derived reasonable benefit from the grant of a concession. Nevertheless, some value attaches to the provision that concessions of mining rights must be limited to five square miles and of agricultural or forest products to twenty square miles, and that reasonable protection must be given to native rights of hunting, shifting cultivation, or collecting firewood. Applicants must also satisfy the Governor as to their financial status, and commence development within a stated period; these conditions are valuable in that they prevent land being acquired by persons who merely hope to profit by disposing of their rights to third persons. The effects of the existing legislation were investigated by a commission presided over by Sir H. C. Belfield, which reported in 1912, but though it expressed concern at the extent of alienations in the colony no further steps were taken. Not the least significant of the effects of this system has been the growth of indebtedness owing to litigation over land and concession rights.²

When Ashanti was annexed in 1901 the opportunity was not taken to assume rights which would give better means of control over the disposal of lands; the system prevailing in the Gold Coast was maintained, save that the Kumasi town lands were reserved

to the Crown, and the government, to which the Ashanti Concessions Ordinance gave powers to regulate the procedure to be followed in the acquisition of concessions, requires negotiations to be carried out through the District Commissioner.¹ Provision for lands required for public uses was secured by Ashanti Ordinances 1 and 2 of 1902, which reproduced the Colony Ordinance of 1876.

It is difficult to obtain complete figures of alienations to non-natives in the Gold Coast Colony and Ashanti. Concessions for agricultural purposes have been few, and it has been stated that only one European company has survived the depression period. The total concessions validated by the High Court covered in 1935 some 8,805 square miles out of 23,937 in the colony, and 2,986 square miles in Ashanti out of 24,379 square miles. Alienations of some extent seem to have been made to natives for cocoa gardens and the like, though no record exists of the amount.

Circumstances gave the administration a freer hand in framing its land policy in the Northern Territories. Exposed to the attacks of Moslem forces from the countries south of the Sahara, these regions had, nevertheless, escaped absorption in the Fulani empires which occupied Northern Nigeria. They had been subjected to the full force of slave raiding, and as a result the population was sparse and disorganized; there were no strong political authorities such as were encountered in the colony and Ashanti. In its administrative policy government was, as already shown,² able to adopt a system which has gradually taken the form of indirect rule similar to that of Nigeria or Tanganyika, and its land policy has developed in the same direction as in those territories. There was no pressure for concessions either in agriculture or mining; the state assumed ownership of mining rights, which are disposed of by the administration.³

The linking up of communications with the south about 1926 seemed to make it desirable to introduce a definite measure of control over the land. In doing so the government was influenced both by the recommendations of the Belfield report of 1912, which had emphasized the mischief of unregulated alienations, and by

¹ Concessions Ordinance, 1903, sect. 4 (3) and Schedule B, *Laws of Ashanti*, 1928, chap. v.

² See Chap. IX, pp. 476-7.

³ The Minerals Ordinance, no. 20 of 1936.

other investigations made in West Africa.¹ In 1927 it issued the Northern Territories Land and Native Rights Ordinance, which, following the lines adopted in Nigeria, declared all lands to be public lands, with the qualification that the validity of existing titles would be recognized if proved within three years. The provisions for the grant of a certificate of title of occupancy also follow the Nigerian precedent; the power of the Governor to levy rent was, however, limited to towns; rights of occupancy were to confer no rights to minerals, and it was declared unlawful for a native to alienate his rights to a non-native without the consent of the Governor. The Ordinance met with the typical Gold Coast criticism that it was a confiscatory measure, but criticism served on this occasion merely to secure, in the revised Ordinance 8 of 1931, the substitution of the term 'native' for 'public' lands, with the added declaration that they were at the disposal of the Governor 'for the use and common benefit' of the native. Rights of occupancy might be granted for periods not exceeding ninety-nine years. Further, the rent clauses were modified by withdrawing the provision which made it permissible for the Governor to levy rent only in urban areas; but a proportion, not less than one-half of all urban rents, and of rents received from non-natives in rural areas, is to be paid to the native authority. Since 1931 an amendment² to the ordinance stipulates that one-sixth of the balance of all rents received shall be paid into a benefits trust fund³ which has as its object the provision of financial assistance for the poorer native administrations. The Crown has so far used its powers only to alienate five square miles, but the occasion for a more extended use may arise if the surveys now being made prove the existence of gold.

The mandatory power has extended this ordinance to the northern area of British Togoland.⁴ It does not appear that use has been made of this ordinance to alienate land to non-natives, there being no outside demand for land. In the southern section the same system prevails as that described in the Gold Coast Colony and Ashanti; its application has been the easier in that there has

¹ See above, p. 772.

² Ordinance 27 of 1936.

⁴ Lands and Native Rights Ordinance 1931, (Application) Ordinance 2 of 1933.

been no demand for mining concessions. On the other hand, there has been some sale to natives other than local residents, and it is a question whether failure to control such sales is technically in accordance with the obligations of the mandate.¹

(n) *The Gambia and Sierra Leone*

Both in the Gambia and Sierra Leone the small colony areas may for the present purpose be neglected. In the protectorate area of the Gambia the theory of native proprietorship has been maintained on the same lines as in the Gold Coast Colony and Ashanti. Ordinance 6 of 1896 defined public lands to include the lands of conquered or deposed rulers, lands vested in a ruler before the protectorate was declared, as a ruler and not as a private person, and lands not in the actual occupation of persons having under custom an original or derivative title to them. This would give the Crown potential rights over land that is definitely 'vacant', but in the absence of a demand for alienation no steps seem to have been taken for the delimitation of such lands. Alienation to non-natives does not constitute a problem in the Gambia; such questions as arise in regard to land rights are due chiefly to the desire of immigrant natives from neighbouring territories to acquire land for cultivation. The administration has so far left these questions for settlement under native law; the Protectorate Ordinance 30 of 1913, which regulates the administration of land, makes applicable all native law not incompatible with natural justice or the principles of the law of England.

In the Sierra Leone Protectorate the theory of native ownership has also been recognized. The Protectorate Native Law Ordinance 16 of 1905 and Ordinance 16 of 1907 had the effect of vesting the land in the tribe; the assertion of native rights was maintained in the Protectorate Lands Ordinance of 1927 (as extended by Ordinance 32 of 1933), which states that 'all land in the Protectorate is vested in the tribal authorities, who hold such land for and on behalf of the native communities concerned'. Two measures of control have, however, been adopted. The grant of concessions was dealt with in a series of ordinances commencing in 1902 and consolidated in Ordinance 29 of 1931, which regulated

¹ Article V, para. 2.

alienations by tribal authorities. The assent of the Governor is required for such alienations; he may sanction concessions to non-natives of not more than 1,000 acres, if they are for the benefit of the chiefdom, and of larger areas, if for that of the country as a whole, subject to the sanction of the Secretary of State when the area exceeds 5,000 acres.¹ A Concessions Court, constituted as a division of the Supreme Court, is charged with examining and validating concessions recognized by the Governor.

European commercial interests, as in Southern Nigeria² and the Gold Coast, have shown a desire to acquire land rights which would allow them to develop the palm-oil industry. The British Government itself showed some anxiety lest the competition of companies operating under concessions granted in foreign colonies, notably the Congo, should injure British interests,³ but felt at the same time bound to protect the native against the expropriation of his lands. After lengthy negotiations,⁴ it agreed to the passing of the Palm Oil Ordinance 7 of 1913, which empowered the Governor, with the assent of the tribal authority, to grant renewable rights, for a period not exceeding twenty-one years in the first instance, over areas of not more than ten square miles, enabling the concession-holder to erect oil mills to the exclusion of other enterprises. The ordinance did not, however, give rights over land, nor did it give a right to purchase produce. The measure was not fruitful of results, for experience showed that the native was unwilling to sell his produce at prices which often compared unfavourably with those he could earn by extracting the oil himself. A committee appointed in 1924 considered that if the West Coast palm industry was to be placed on a proper basis the oil companies could not be left entirely dependent on the willingness of the natives to sell their palm fruit, but must have their own plantations.⁵ The Concessions Ordinance had been amended in 1922, so as to legalize concessions not exceeding 5,000 acres if made for the sole purpose of cultivating the oil palm

¹ Concessions Amendment Ordinance, 29 of 1906; Concessions Ordinance, 29 of 1931.

² See above, p. 770.

³ *Parliamentary Debates, House of Commons*, 1913, vol. lvi, col. 786.

⁴ *Correspondence respecting the Grant of Exclusive Rights for the Extraction of Oil from Palm Fruits*, Cmd. 6561 (1912-13).

⁵ *West Africa, Palm Oil and Palm Kernels*, Colonial 10, 1925, p. 9.

on scientific lines; the leases were, however, to be granted by the tribal authority, and not more than 1,000 acres could be obtained from any one chiefdom. This provision was repealed by the Concessions Ordinance of 1931, which, however, retains a clause stating that a grant of land made with the consent of the Governor and, where necessary, with that of the Secretary of State is not a concession in the meaning of the Ordinance and may be regarded as valid without submission to the Concessions Court. It does not appear that any concession has so far been authorized under this Ordinance for the cultivation of the oil palm.

The second measure of control, to which reference has been made above, relates to the regulation of the terms of tenancy rights held by alien natives. The Protectorate Lands Ordinance of 1927 provided that such natives require the assent of the tribal authority before taking up land, but their occupation, unless approved by the District Commissioner, would have the value only of a tenancy at will; land occupied with this sanction, if not covered by a lease, could be held only for three years; leases could not extend beyond fifty years, and rents were subject to revision by the district authorities every seven years.

(o) *The French Colonies*

The course taken in regard to land rights in French West Africa was influenced in some degree by the experiences of Algeria. There the demand for land by colonists had been mainly responsible for the conflicts which for long made colonial expansion an unpopular cause in France. The land history of Algiers has chapters reminiscent of the Union; the early *refoulement*¹ or driving back of the natives, and the confiscation of their lands, was followed by the policy of 'cantonment', which presented some of the features characteristic of the system of reserves.² The next stage saw one of those reversals of policy not unknown in French colonial history; the tribes were to be declared proprietors of the lands of which they had 'permanent and traditional enjoyment'.³ That step came too late to preserve the best of the lands for the tribes, and it

¹ See L. Vignon, *La France dans l'Afrique du nord*, 1888, p. 32.

² See the Franck-Chauveau Report, 'Propriété foncière', *Journal Officiel*, 1893, pp. 262 ff.; and S. H. Roberts, *History of French Colonial Policy*, 1929, p. 197.

³ *Sénatus-Consulte* of April 1863.

failed further as a measure of protection, since tribal lands were not closed to European purchase; on the contrary, a law of 1873 applied to native lands the principle of French law which recognizes only individual rights and not communal ownership; co-sharers in tribal lands were to apply for the partition of their shares, and these were to be alienable. Caught in a maze of litigation, the Arabs in the years 1883 to 1889 lost 40 per cent. of their lands,¹ largely through executions for debt, and further legislation was necessary in 1897 to check this process and give some stability to tribal conditions. The conditions in French West Africa differed in one important respect from those in Algiers; there was little pressure to secure land for colonists. An attempt to start a plantation in Senegal early in the nineteenth century had proved abortive, and henceforward economic policy was mainly directed to the development of a peasant economy assisted by the state.

In French Equatorial Africa, on the other hand, the fact that the reduction of the home subsidy for development had left the colony without resources, and that a relatively greater capital outlay was required to overcome climatic and transport difficulties, indicated a policy of development through European *entrepreneurs* similar to that which appeared to be achieving some success in the Congo Free State. This method involved the concession of monopolistic control over forest produce, with the guarantee of an ultimate freehold in selected areas of land proportionate to the development effected. Already in 1893 certain monopoly concessions of this type had been given by the Ministry, but the agitation which followed, based mainly on political grounds, caused the government to revoke them in 1895. The demand for concessions led, however, to the appointment in 1898 of a Commission on Colonial Concessions, which recommended the introduction of legislation fixing the terms on which they could be granted. The decrees issued in 1899 as a result of their proposals represented the first definite statement of the nature of the rights claimed by France in the land of her tropical African territories.

In a number of treaties previously concluded with native chiefs

¹ V. Piquet, *La colonisation française dans l'Afrique du nord*, 1912, p. 207.

the French Government had guaranteed their rights over the land, and the Decrees of February and March, 1899, showed a formal desire to recognize the existence of these rights. In claiming only the *terres vacantes et sans maître* for the state they follow the principle of the French code; but its application to colonial territory has been criticized by some French authorities on the ground that there is not, even in the less thickly populated Sudan, 'an inch of land without a master',¹ a point of view which, as has been seen, has also received recognition in some of the British West African areas. The claim may in theory be justified in almost any part of Africa, if one does not insist that the term 'ownership' is equivalent to the proprietary right as understood in Europe, but it is possibly more nearly descriptive of the settled than the pastoral or forest areas. The value to Africans of the admission of this position would depend in any case on the nature of the terms given by the state on extinguishing rights over the lands it may require for settlement or colonization; and the consequences which the decrees of 1899 involved similarly depended on the interpretation given in practice to the term 'vacant lands'. Those who supported the system of monopolistic concessions in French Equatorial Africa pointed out that they only contemplated the grant of freehold areas at a secondary stage, the first stage being that of rights over the collection of forest produce, and it was claimed that the form of the decree would enable areas to be selected for alienation after further investigation had shown that rights were non-existent or so tenuous as to be easily compensated, such as hunting rights or rights of occasional grazing.

In the application of these decrees the two territories have adopted methods so different that it is well to treat of them separately. In French West Africa the framing of the land decrees has shown evidence of a definite concern for native rights; this was an attitude natural to an administration which had experience of the organized conditions of the tribes in Senegal or the Sudan. When, on the formation of the Federation, the legislation of the different colonies was consolidated in the Decree of October 23, 1904, the basic principle that vacant lands belong to the state was

¹ M. Delafosse, *Haut-Sénégal-Niger*, 1912, vol. iii, p. 14; P. Dareste, *Le régime de la propriété française en A.O.F.*, 1908.

maintained, but it was laid down that lands forming the collective property of natives could only be ceded to individuals after approval by *arrêté* of the Lieutenant-Governor. There are some differences in detail as between the various colonies; in the Niger, an *arrêté* of August 12, 1924, prescribed that natives could not be evicted without their consent; but in the Sudan, under the *arrêté* of April 24, 1920, natives could only claim compensation for removal; in French Guinea, by the *arrêté* of April 13, 1912, land required for native cultivation must be reserved from concessions, but removal of natives to other lands can be effected by agreement or payment of compensation.

Though in French West Africa the position taken by the state in regard to 'vacant' lands has created less difficulty than in some other territories, owing to the lack of demand for land for colonization, the legal position has not always been easy. In 1907 the West African Court of Appeal held that, in succeeding to the rights of a chief over territory in which no individual property was recognized, the French Government acquired absolute rights over all land not held under title, a decision dictated by the inability of French law to recognize any right in land other than that of the individual, with the result that a communal tenure can have no status at law.¹ The government at one time accepted this position so far as to agree that the state was legally proprietor of all lands other than those on which natives had acquired title by administrative concession or by prescription; but the courts, in their turn, denied that prescription could be extended from French to native conditions. The position taken up by the courts was thus at variance with the intentions of the 1904 Decree, and a Land Commission was appointed in 1915 to recommend a solution. This commission did not report owing to the War; but there has been no sign that the government wishes to take undue advantage of the position which the legal decisions have created for it.

The various decrees on the subject of land were consolidated in that of November 15, 1935. In repeating that the state is owner of lands vacant and *sans maître*, it adds that it has control also of any land not used or occupied for ten years. Land required for public uses, up to 100 hectares, can be taken up by *arrêté* of the head of the

¹ P. Dareste, *op. cit.*, 1908, pp. 16, 20.

province; the sanction of the Governor-General is needed for larger areas. Areas up to 200 hectares can be alienated by local *arrêté*, from 200 up to 2,000 hectares by *arrêté* of the Governor-General; those in excess of this figure must be sanctioned by a decree of the French Government. The terms of a concession must indicate the areas which are occupied by or reserved for natives; land under cultivation cannot be taken up without compensation to the occupier, which must be arranged by the administration. Concessions in rural areas are given in the first instance provisionally, title being confirmed on compliance with stipulated development conditions. There were a certain number of concessions given out before 1903 which were afterwards abandoned by the holders; the total now recorded as held by concessionaires is 93,284 hectares held on provisional tenure, and 57,419 hectares on 'definitive' tenure. The majority of these concessions are in the Ivory Coast and French Guinea, and are used for the development of banana, rice, and coffee plantations.

In Equatorial Africa monopoly rights were granted in the first rush of concessions over about two-thirds of the whole territory. They were divided between some forty companies, and carried a monopoly over all forest produce for thirty years, subject to native rights in areas to be defined by government, in return for the payment of a low annual rent and of 15 per cent. of the profits to the state. Freehold was ultimately to be given over all 'developed' areas, of which there was a somewhat complicated definition, including the planting of 150 rubber trees for each ton produced. It is noteworthy that the first protests against the system came from English traders affected by the operation of the monopoly, and pressure from the British Government resulted in their receiving a grant of land in compensation, together with a considerable cash indemnity. An incidental result of their complaints was a decision of the French Court at Loango in 1900 that, until the native lands were delimited, the entire territory of the concessions must be taken as subject to the rights of the concessionaires. It is not necessary to recall here the reign of anarchy which these monopolies introduced, or the hardships which they inflicted on the natives; in regard to the land, it is sufficient to say that, while they did not, in the first instance, actually deprive natives of its

possession, the use of it was gravely restricted. In the treaties made with chiefs during the original occupation of the French Congo the government had agreed to respect their rights over land; but native lands were defined in the ministerial instructions of 1899 as only the areas necessary for the cultivation of food-stuffs. The decision of the Court of Loango led to demands by the Colonial Ministry in 1901, and again in 1902, that an attempt should be made to delimit native reserves, but the opposition of the concessionaire companies prevented any effective steps being taken in this direction. The local administration contented itself with issuing an *arrêté* in 1903, declaring that in principle the native reserves should extend over one-tenth of the conceded territory, a provision which could have no effect in the absence of a survey which would allow of their delimitation.

The revulsion of feeling in France against the abuses produced by the monopolies, and the growing proof of the economic failure of the companies, combined to force the French Government in 1910-12 to consider a revision of the system. Faced by the same difficulty in the earlier days of their occupation of the Cameroons, the German Government had materially cut down the original grants in agreement with the concession companies,¹ and a similar use of the principle of 'cantonment' was urged on the French Government by critics of the monopolistic policy. A long series of negotiations resulted in the abandonment by a number of the companies of their rights under the 1899 concessions, in return for 10,000 hectares of land, a monopoly over rubber collections for ten years on the original areas, freehold over the area under cultivation at the end of that time, and after that for a further ten years a rubber monopoly over ten times the freehold area, the additional area brought under cultivation at the end of the second period likewise to become the property of the companies. This arrangement provided for a return to the state of 31,500,000 hectares out of the 87,000,000 alienated in 1899. At various times after 1912 other companies came into the agreement: in some cases a fixed area was at once given in freehold as compensation, while the concessions of a certain number of companies which stood out of the arrangement expired in 1929. The commitments

¹ See below, p. 775.

of 1900 have thus been liquidated at a heavy loss to the natives, while the financial gain of the monopolistic system to the colony was comparatively small. The authority of the local administration to grant concessions has also been revised; an *arrêté* of 1926 provided that the power to grant concessions up to 10,000 hectares, conferred by the legislation of 1899, should be subject to the condition that land over which natives hold rights can only be alienated on payment of compensation at rates fixed by the administration. No figures are published of recent alienations, but they appear not to have been numerous.

(p) *The French Cameroons*

The land law which the Germans introduced in the Cameroons has been described in dealing with the British Cameroons.¹ At the outset of their rule they made concessions of the type of those granted by the Congo Free State and in the French Congo, mainly with a view to the collection of rubber. That made to the *Gesellschaft Süd-Kamerun*, in 1898, comprised an area of 7,200,000 hectares, but 'subject to native land rights'; in the following year rights over 4,500,000 hectares were given to the Northwest-Kamerun company, which had the right to choose Crown land within this area, but in occupying such land it was to respect existing native rights. Difficulties which arose with the Süd-Kamerun company led to the application of the process of 'cantonment' to its grant, and in 1905 the area was reduced to 1,500,000 hectares, and the conditions were revised; the Northwest company failed to meet its obligations and its grant terminated in 1913. Meanwhile a considerable number of concessions had been made to individual grantees, mainly in the south-west of the territory, for cocoa, rubber, and oil-palm plantations. In the liquidation of ex-enemy property at the close of the War the estates were auctioned of which the title had been recognized by a commission appointed for the purpose, subject to the right of the state to exercise pre-emption at prices fixed by the commission. By 1925 some 362 properties had been dealt with, of which 219 were auctioned and 107 were taken in pre-emption, while 40 sites occupied by the German Government for administrative purposes were held to have passed to the new administration

¹ See above, pp. 774-5.

under Article 120 of the Treaty of Versailles. The former German owners did not succeed in regaining their holdings to the same extent as in the British Cameroons, and the area in their hands is now relatively small; a number of the pre-empted properties have since been resold to French subjects.

The provisions of the French West African legislation of 1904 were extended to the Cameroons by a Decree of August 11, 1920, thus giving the state a claim to the ownership of 'vacant' lands. A local *arrêté*,¹ defining the terms of application of the Decree, recognizes as a distinct category land in the neighbourhood of villages over which natives exercise usufructuary rights: these are defined as reserves. Vacant land is alienable by the state under different rules for urban and rural lands; a proposal to alienate must be published in the *Journal Officiel*, with a local notice to natives concerned, who have a right to object; but it is worthy of note that if claims, which are heard by the administrative authorities, are proved baseless, the claimant is liable to a fine. As in French West Africa, a provisional title is first given, and is completed only on proof of compliance with the conditions laid down regarding beneficial use and the like. Grants of more than 1,000 hectares of rural lands, as against 2,000 in French West Africa, must be confirmed by a decree from the Colonial Ministry. Land belonging to native communities can be alienated, subject to the approval of the local administration.

The 'native reserves' are considered to be held in usufruct and not in ownership, and natives cannot dispose of them, though they may be alienated by the state, subject to the grant of compensation to the occupiers. There has been no regular delimitation of these reserves. The German Government had set aside certain *Reservats* in districts such as Dschang, where they regarded native occupation as too dense to allow of any alienation;² these were maintained by the French administration, which added certain other areas to this class. While the explicit recognition that land in actual occupation is to be regarded as reserved may represent an advance on previous legislation, rights in such land are inadequately safeguarded in the absence of a survey or other means of delimitation. Colonization has been accepted as

¹ *Arrêté* of Sept. 15, 1931.

² See above, p. 775.

part of the policy of the mandatory power,¹ and colonists have received assistance through loans given by the local *Caisse de Crédit Agricole*. For climatic and other reasons, however, alienations have not taken an extended form; the individual grants are not large and are mainly for growing coffee and bananas. It appears that up to 1935 the administration had given out 68,745 hectares in provisional and 21,969 hectares in definitive right. At the same time it is clear that the alienation of land has begun to cause some measure of conflict with native rights, and the administration has lately indicated that certain further areas are being set aside as 'reserves', in which no Europeans may acquire rights, though it is considered that natives from more congested areas can properly be moved into them. In French Togoland, to which the decree of 1920 also applies, there has been very little colonization, and for some time no alienation has been made.

(q) *The Belgian Congo*

The history of the Belgian Congo at one time reflected the results of the development of the concession policy in an even more extreme form than that of French Equatorial Africa. In the earlier days of the Free State, King Leopold had no method of securing capital for railway or similar developments other than by the grant of large areas of land, or of monopolies over the products of the soil. Thus the Matadi-Stanleypool Railway owed its existence to the promise, in 1886, of an extensive grant of land, and the railways connecting the Upper Congo with the Lakes were similarly financed in 1902. This principle was afterwards extended to obtain revenue which neither the customs receipts, limited as they were by the Berlin Act of 1885, nor direct taxation were able to supply. The first declaration of the rights claimed by the state over land was framed when the concession was given for the Matadi Railway; it took the same form as that which, as has already been shown, was adopted in 1899 in the basic decree regarding lands in the French African colonies—namely, a statement claiming vacant lands as the property of the state;² vacant

¹ *Rapport annuel au conseil de la Société des Nations sur l'administration du Cameroun*, 1932, p. 105.

² Ordinance, July 1, 1885; Decree, Sept. 14, 1886; *Codes et lois du Congo belge*, p. 1645.

lands could be alienated by the administration, and sales of land made by natives were only to be recognized if confirmed by the state. In Belgium, as in France, writers have criticized this measure, pointing out that all land is claimed by some tribe, and that, in particular, palm trees have always a potential native owner.¹

The concessions made did not, however, in the first few years, involve taking actual possession of the land, and native rights over it were not in fact restricted; it was only when the Free State, in the attempt to improve its resources, introduced a state monopoly over the collection of rubber and ivory that it adopted a more rigid interpretation of its own decree, in order to give itself the necessary rights over the land. Native rights were now held to exist only over the area under actual cultivation, with the corollary that all other land could be controlled or alienated by the state. The measure had a double purpose; it gave a freer hand to the state in making grants to railway and other development companies, and enabled it at the same time to assert a legal claim over the forest and other products of land not actually under native cultivation. It utilized this power to give concessions of the monopoly of purchase of rubber to companies (such as those subsequently merged in the *Compagnie de Kasai*), and also to make direct collections itself through the rubber tax.² The protests of traders against the monopoly, and the widespread feeling against the abuses produced by the rubber tax and use of forced labour, led to the appointment of the Commission of Enquiry of 1904 and to a material modification of the system of collection, together with a change in the land law. A Decree of June 3, 1906,³ recognized that land inhabited, cultivated, or exploited in any manner was 'occupied', and indicated that steps were to be taken to demarcate native reserves, which would be at least three times as large in area as that of the 'occupied' land. Such lands could be sold by natives, subject to the sanction of the administration. The delimitation was, however, effected only within the territory of two large concessions, the Bus-Bloc (the freehold area owned by the *Compagnie du Congo* and its subsidiaries) and the Katanga:

¹ A. Vermeersch, *La question congolaise*, 1906, p. 175; H. Vanderyst, *Congo*, 1925, p. 731.

² See Chap. X, p. 593.

³ *Codes et lois*, p. 1646.

and, owing partly to the difficulty of allowing for the practice of shifting cultivation, partly to the cost involved, the attempt to complete it was abandoned in 1922.

The abuses of the Free State monopoly system belong so much to past history that they need not be enlarged upon here. But it is important to note the remarkable extent of the concessions granted. They were of three kinds. The grants to the railway companies covered over 9,000,000 hectares. The terms of the Katanga concession were more comparable to those of the charters in which Great Britain entrusted administrative functions to commercial companies, but they also included the grant of freehold property in one-third of the territory which the Company brought under control. In the end no division was made, the whole territory being placed under the administration of a joint body, the *Comité Spécial du Katanga*, two-thirds of whose members represent the government and one-third the Company, the latter receiving one-third of the revenues. The total area subject to the administration of this body is estimated at 45,000,000 hectares. The third type of concession was that to which reference has already been made, the monopoly of forest produce. These monopolies, in their original form, covered an immense extent of territory, but as they did not confer freehold rights their area was not calculated. The total area covered by grants of freehold when the Congo Free State was annexed by Belgium in 1908 has been calculated as 27,100,000 hectares, including the area representing the share of the Katanga Company.¹ The Belgian Government concluded a series of negotiations with the concessionaires, other than the Katanga Company, as a result of which they abandoned certain of their monopoly rights in exchange for the right to freehold areas to be selected within the boundaries of their concessions, and also reduced some of the original freehold areas. By these reductions a total of 9,209,483 hectares reverted to the state.²

The government continued to encourage European enterprise, but it now alienated land under concessions of a different type. Under this form, the grantee had the right, at the end of a preliminary period, to choose blocks of land up to a fixed maximum

¹ T. Heyse and H. Leonard, *Régime des cessions et concessions*, 1932, p. 186.

² Ibid.

within an area from which other claimants were excluded during this period, the area to be acquired depending on the fulfilment of certain development conditions. The most important grant of this type was that made in 1911 to the *Huileries du Congo Belge*, which was associated with the Lever interests.¹ This Company obtained the right to lease a maximum of 750,000 hectares, divided between five circles of a radius of 60 kilometres, the amount leased in each circle being dependent on the erection of oil mills of a given capacity. The selection was completed in 1926. In 1945 the Company will be entitled to freehold rights in an area of 150,000 hectares, not more than 40,000 being in any one circle; while, if in the five years preceding 1945 it exports 30,000 tons of oil, it will be entitled to ownership of the whole 750,000 hectares. The state will be entitled, every ten years from 1951 onwards, to take back undeveloped land in blocks of not less than 100 hectares.² A somewhat similar concession extending over 30,000 hectares has been given to the *Compagnie Sucrière Congolaise*. The recommendations of the Advisory Committee on Labour in 1928³ led in 1929 to a further change in the concession policy; no further mining concessions were to be granted, and only one-third of the territory was to be open to large, and one-third to small-scale agricultural concessions.

A special arrangement has applied, since 1928, to the Kivu region, which is the only area of the Congo proper that appears to be climatically suitable for European colonization. Here the *Compagnie des Chemins de Fer des Grands Lacs* had a concession which, as revised in 1921, gave it an option over 400,000 hectares, to be selected by 1936. In order to resume its control, the government reconstructed this Company on the lines adopted for the Katanga; the new *Comité National du Kivu*, in which government holds a controlling interest, is charged with the development or colonization of an area of 8,000,000 hectares. The government policy, however, seems to be generally opposed to the extension of colonization in the Congo.⁴ The total area so far alienated by the *Comité* is 23,276 hectares. The progress of alienation in the Congo in recent years is shown by the fact that the state alienated 84,649 hectares in

¹ See above, p. 770.

³ See Chap. XI, p. 646.

² T. Heyse and H. Leonard, *op. cit.*, pp. 278-85.

⁴ *Rapport de la Commission des Colonies*, no. 87, 1936.

1932, 69,888 in 1933, 32,926 in 1934, and 14,904 in 1935. A certain number of concessions have lapsed or been abandoned, and it may be taken that, excluding the Katanga and Kivu areas, in which the state retains substantial rights, the total area now alienated is about 5,275,000 hectares, out of the total area of 235,000,000 hectares.

As already shown, no general delimitation of native lands, such as was contemplated by the 1906 Decree, has been made in the Congo. It is now considered sufficient to go over the ground when a concession has been applied for and to mark off the areas covered by native rights; these must remain untouched unless the concessionaire can come to terms with the right holders. Where the sale is made by natives themselves, under the rights recognized by the decree of 1906, the law provides for a careful supervision of the transaction. An Ordinance of October 6, 1930, stipulated that any such sale must be preceded by an inquiry on the spot by a commission of three members, consisting of a member of the judiciary as chairman, a missionary, and either an official or leading local non-official European; their report must give an opinion as to the fairness of the price and indicate the persons to whom it should be paid.¹ A further amendment of May 31, 1934, substitutes for the commission a special delegate of the Governor-General, and provides for a period of two years during which the evidence recorded in the inquiry may be contested.² Provided, therefore, that the area in which native rights exist is correctly ascertained, the safeguards provided against the abuse of the natives' right of alienation are substantial.

Meanwhile it must be noted that considerable difficulty has arisen in regard to native rights held within the territory of the older grantees, particularly the palm concessions of the Lomami Company and the *Huileries du Congo Belge*. The absence of a defined boundary between native and Company land led to constant charges of trespass by natives when collecting fruit. By an arrangement made in the Lomami concession the whole land has been left *en indivision* until a definite demarcation can be made as between the Company and the natives, the latter being meanwhile free to collect fruit anywhere, but under an obligation to sell it

¹ *Codes et lois*, p. 1653.

² *Ibid.*, p. 1649.

all to the Company. The agreement concluded with the *Huileries du Congo Belge* is more complicated. In each of the five blocks chosen by the Company, an area not greater than the total estimated to be free of native rights has been developed *en indivision*; in this area natives may move freely and establish habitations where they choose, till any land is appropriated by the Company for plantation, when it is marked off and fenced; after this natives are excluded from it; within the rest they may gather palm fruit as they please, but must sell it to the Company. Both here and in the Lomami Concession the price of the fruit is fixed by government. The final delimitation of land was to begin in May 1936, when the natives were to receive a total area equivalent to that calculated as requisite for their needs at the time the contract was concluded. In 1934, however, it was decided that the operation could not be carried out within the prescribed period, and demarcation is deferred until 1944.

(r) *Ruanda-Urundi*

In what is now the mandated territory of Ruanda-Urundi the German Imperial Decree of November 26, 1895, claimed for the Crown complete ownership of the land; a local Land Commission was to decide what lands were unoccupied and therefore available for grant by the state to Europeans. Direct grant from the state was the only means by which freehold could be obtained; land might be leased from natives, but the period was limited to five years. At the same time, Europeans could themselves arrange directly with natives to vacate their land on payment of compensation, and when the state was satisfied that this had been paid it was prepared to give a freehold grant. Actually, the German alienations here were few; when the Belgians examined the matter in 1930 they only admitted titles in 1,558 hectares. The Belgian Government was for some time chary of allowing any alienation of land to non-natives; at the outset it made provision only for leases up to five and then ten years, increasing this to twenty years in 1925; the chief demands for land up to this time were for mission stations. In 1927 it put in force a Congo Decree of September 14, 1886, which makes the validity of sales by natives dependent on the sanction of the administration, and forbids any measure which

would result in their expulsion from land in their occupation or deprive them directly or indirectly of means of subsistence. The Decree of June 3, 1906, has not been extended to this area, but the Decree of October 6, 1930, which regulates the inquiry to be made before land is alienated, is in force. The policy has always been one of caution in the appropriation of native lands. There has been no encouragement of a policy of colonization. Out of the total area of 5,320,000 hectares the state has taken over for its own purposes 45,509 hectares, of which 34,500 form part of the *Parc National Albert*; much of the remainder is used for seed farms. It has also reserved 187,000 hectares for a *Parc National de la Kagera*. The decree constituting National Parks preserves the rights of the natives living within the areas.¹ The areas alienated by the state (including the recognition given to German titles) amount in all to 12,192 hectares, of which 9,253 are still on lease; the alienations have been mainly for mission stations, schools, &c.

(s) *The Portuguese Colonies*

Material regarding the practical operation of the land policy of the Portuguese Government is difficult to obtain. The legal position is regulated by a Law of May 9, 1901, which laid down that all land which at that date did not constitute private property in accordance with Portuguese law was state domain. Decrees of 1918 for Moçambique and 1919 for Angola provide for the reservation of certain areas for the exclusive use of the native population, and these lands may not be alienated. Natives are not obliged to reside in these reserves, but may occupy unalienated land outside them, and land in their actual occupation must not be included in grants to Europeans. A decree of 1927 in Angola provided that the area over which the natives were to retain rights was to be calculated as five times that in actual occupation. They cannot be required to leave these areas except on payment of compensation and on a guarantee that an equal area of land will be made available for them in the reserves. Land left uncultivated for more than a year is regarded as vacant. The report of the Survey Department for this territory in 1933 stated that an area of 160,472 hectares was in the hands of natives, 154,556 hectares being tribal reserves, and the remaining

¹ Decree of Nov. 26, 1934, article 4.

5,916 hectares held in individual title. Statistics of the area of native land in Moçambique are not available.

The normal method of land alienation at the present time is by concessions similar to those given in French West Africa—that is to say, temporary grants which are confirmed on the execution of stipulated development conditions. The maximum area of a single concession is 50,000 hectares, but in specified districts the limit is fixed at 10,000 hectares. The approval of the Colonial Minister is required for concessions above an area which varies in different territories from 1,000 to 5,000 hectares;¹ in order to obtain confirmation of title, the concessionaire must spend on improvements two hundred times the price of the land. Concessionaires are exempt from land tax for the first eleven years if the concession is beneficially used, otherwise an additional tax may be imposed; at the end of ten years the state may revoke the whole or part of the concession for failure to develop.

In Angola a project for colonization on a large scale was adopted in 1928. Collective colonies were to be formed by the emigration of whole villages to selected sites which were to be surveyed and prepared for them in advance; the state was also to provide assistance for the colonists in the form of seed, stock, implements, and credits. Owing partly to insufficient preparation and partly to the fact that the economic depression began to be felt almost as soon as the scheme had been set going, it was found to be unduly costly and its abandonment was recommended in 1933.² In Moçambique rights over a considerable part of the territory were allotted in the early seventeenth century to individuals who were held to exercise over the native population such powers as had previously been vested in their own chiefs. Various measures increasing the control of the state over these *prazos*, some of which are hundreds of square miles in extent, were introduced in the course of the nineteenth century, and they are now held as concessions for twenty-five years. The holder is obliged to cultivate a stipulated area, and is responsible for the administration of justice and the collection of taxes. Conditions on the *prazos* are subject to inspection on behalf of the administration. A number of them are administered by the

¹ Comte de Penha-Garcia (Editor): *Les colonies portugaises*, 1931, pp. 345 ff.

² *Relatório da Repartição dos Serviços de Cadastro e Colonização*, 1933.

Zambezia and Moçambique Companies, who may alienate them subject to government approval. The proportion of their land alienated by the Moçambique Company is given as 6 per cent.; for the rest of the colony no statistics are published.

(i) *The Legal Basis of Land Alienation*

The diversity of conditions under which land policy has developed in different territories has involved the presentation of a somewhat lengthy statement of fact, and it is not always easy to distinguish the legal theory on which states have acted in claiming the right to make alienations or to control transfers made by natives. Of the categories into which jurists divide the methods of acquisition of territory, both cession (which would include agreements of various types) and conquest are represented in the history of Africa; in no case can the colonial governments base their legal claims on a third process known to international law, that of prescription, or perfection of title by long and undisturbed occupation.¹ The value of many of the agreements under which European powers acquired dominion is debatable; but for the present purpose attention must be directed not to the methods by which sovereignty has come into existence, but to the manner in which it has been manifested in the exercise of control over land.

The exact point at which sovereignty may be said to commence is not always easy to determine; at times it has to be inferred constructively from action taken, rather than from the issue of any formal announcement, which in itself has only the value of a declaration of a state of fact.² Where formal declarations have been made, the procedure has been to announce either annexation or the creation of a protectorate, and though no uncertainty attaches to the implications of the former, some doubt has existed as to the authority implied by the latter. Briefly, it may be said that the British Government at one stage regarded a protectorate as conferring only political control; that was typically the case when it first assumed the protection of Bechuanaland.³ At a later stage it

¹ M. F. Lindley, *op. cit.*, 1926, p. 43.

² *In re Southern Rhodesia* (1919), A.C. 238.

³ See above, pp. 730-2. Cf. *Rex v. Crewe, ex parte Sekgome* (1910), 2 K.B. 576.

evolved the theory of the 'colonial protectorate',¹ which assumed that it was empowered to exercise full sovereign powers, both in relation to land and to other functions, such as the administration of justice; its formal declarations were expressed as Orders in Council issued under the Foreign Jurisdiction Act.² This Act contains a declaration that, however the powers of the Crown might have been acquired, whether by treaty, grant, usage, or other lawful means, its jurisdiction is as ample as if it had been derived from the cession or conquest of territory. But the exact measure in which the British Government put into exercise the powers thus taken depended on the nature of the organization which it encountered in the country where powers were assumed, or on the existence of treaties which, by their character or the circumstances in which they were concluded, were entitled to respect. Thus it has followed different lines in the jurisdiction claimed over Zanzibar, and over the lands of the less politically developed tribes of East Africa; and it made agreements, guaranteeing respect for certain of the natives' traditional rights, with the Basuto, Barotse, and Buganda, which it did not find possible to conclude with some of the other Central or East African chiefs.

When once sovereignty has been established, the juridical position becomes sufficiently clear; in the absence of any enactment by the sovereign power having the force of law, the rights of the state in regard to land are deemed in law to be regulated by the general principles of law relating to the powers of a Sovereign on the acquisition of territory; but at any stage the Sovereign can by legal enactment take such powers over land as it deems equitable or expedient. In that case, it is clear that no previous agreement, and no custom in regard to land, can affect the validity of its order; ethical or political considerations may influence its action, but its legal competence is complete. The Privy Council report in the Southern Rhodesia case made it clear that a simple declaration, by means of an Order in Council or otherwise, would have rendered unnecessary the legal investigation into the position of the state in regard to the ownership of the lands in the colony;³ again, it was

¹ Cf. A. B. Keith, *The Governments of the British Empire*, 1935, chap. viii.

² Foreign Jurisdiction Act, 1890, 53 & 54 Vict., c. 37.

³ See above, p. 734.

the fact that the sovereign power had declared its position in regard to the land that put the Kikuyu claimants out of court in the case to which reference has been made.¹

As just stated, when no such declaration has been made, or enactment passed having the form of law, the rights of the state are deemed to be regulated by the principles of law relating to the powers of a Sovereign on a change of sovereignty; in regard to the land, these are expressed in the formula that privately owned property remains unaffected by the transfer unless and until the new Sovereign brings about some alteration in its conditions by its municipal law.² But the application of that principle encounters certain difficulties. The rule is one of those principles of international law which 'rest on the consensus of civilized states': the jurist has always had some trouble in applying it to regions where there is an unfamiliar conception of sovereignty and property; thus in Africa he has not found it easy to attach the attributes of private property to the class of rights existing under native customary law in communally held lands. It is not only the jurist who has suffered from this difficulty; its influence is seen throughout the earlier attempts to establish land policy on a legal basis. If the administrations which felt the need to gain control over land had encountered organizations whose system of tenure was capable of adaptation to their own purposes, which necessarily included the transfer of lands in some form of title suited to modern economic conditions, they might, like the British in India, have been content to regulate their proceedings under native law, or some modification of it; but the prevailing custom in Africa differed so far from the form which property rights have assumed in Europe that this was impossible. That some of the early administrations appeared to take little cognizance of African land custom was not due merely to ignorance of its nature, though certainly there were many misconceptions on the subject; it was due to the fact that at the outset their efforts were directed towards securing powers over the land which could be utilized for their own purposes, and these powers were necessarily such as could be interpreted in terms of European law. They looked, therefore, in the

¹ See above, pp. 747-8.

² See *Amodu Tijani v. The Secretary, Southern Nigeria* (1921), 2 A.C. 399.

first instance, for characteristic evidence of rights of ownership, such, for instance, as might be found in the existence of individual holdings and the capacity to encumber or alienate. The authority which a chief possesses to dispose of tribal lands is, at best, undefined in African custom; and it is now generally accepted that it could seldom, if ever, be held to include the power of outright disposal, since a transfer of this nature was in itself alien to African custom. But his power to dispose of lands was an assumption which, whatever its justification in African law, was a convenience to those who sought to gain rights in the land, of a type which European conceptions of law could recognize; and agreements which, in one form or another, implied or could be taken to imply that chiefs had disposed of the lands under their control, were widely relied on as the basis of the powers over land which administrations found it necessary to acquire.

The practical difficulties of the administrator had their analogy in the juristic field. The concern of the subject people could, no doubt, be summed up in the simple question whether the administration had power to deprive them of their land, which they held on tenures customary to themselves, but of a type unrecognized in the law of the colonizing power. To the latter, the practical issue was whether it had power to take up native lands and convey them to others in some form of recognizable title. In the absence of any enactment having the force of law, the courts could only decide these issues by reference to the nature of the authority over land which was implied in a transfer of sovereignty. The British tribunals set themselves to inquire, in the first place, for evidence of the existence of private rights which a new Sovereign would, on the ordinary principles of law, be obliged to respect, and found the best material for a decision on this point in a consideration of the nature of the relations between the tribesman holding a right of occupation in tribal lands and the native authority who had a traditional right of distribution of such lands. To the African, accustomed only to his traditional conceptions of land tenure,¹ there may seem to be little direct relevance in the question whether 'the usufructuary right of the tribesman' constituted 'a mere qualification of a burden on the radical or final title

¹ See below, pp. 829-36.

of whoever is sovereign',¹ or alternatively, whether 'a communal usufructuary occupation may be so complete as to reduce any radical right in the Sovereign to one which only extends to comparatively limited rights of administrative interference';² but these were the only considerations on which, in the circumstances, the issue then before the courts could be decided. The apparent conflict between the decisions in the Southern Rhodesian and Southern Nigerian cases³ was due not to any variation in the principles followed by the Privy Council, but to the difference which, in its view, existed in the relations between tribesmen and chiefs in the two countries.⁴ Great, however, as is the juristic interest of these judgements, it is now mainly historical, since the position of the state has in each case subsequently been made clear by legislation, and questions regarding the authority of the state over land will in future turn on the interpretation of the law in force. For the French courts the problem has been narrower in scope;⁵ they have in each case been bound by statutes defining the position of the state, and their difficulty has arisen from the fact that, inheriting the traditions of Roman law, they have been unable to recognize that the right of property could exist in a collective form.

The legal form which was adopted by different states in defining the nature of their rights over land was in most cases dictated by circumstances rather than by principle. The immediate need was the rapid development of resources, and views on land questions were largely influenced by the theory held as to the most appropriate means to this end. In some areas it seemed likely to be best achieved by the establishment of a permanent white population, in others, such as French Equatorial Africa, by securing through capitalistic exploitation as large a quantity as possible of exportable products, while there were other territories where the greatest possibilities of development appeared to lie in the activity of the native population itself. Physical conditions and material opportunities accordingly had a larger share in the determination

⁵ See above, pp. 782 ff.

of policy than ethical or legal considerations of the rights of natives in their lands. Even where there was a genuine desire to respect native rights, and such cases are not wanting, the form of legislation tended to be affected by the difficulty, to which reference has already been made, of combining a definition of rights in terms known to European law, with a recognition of the customary system of land rights prevailing in Africa. Policy has accordingly expressed itself in a diversity of legal forms. But in truth the precise form used by any state in claiming rights for itself, or in recognizing those of natives, has not been the factor of primary importance. So far as the native is concerned, the crucial fact is not the manner in which the law is framed, but the spirit in which effect is given to it. As the previous pages will have shown, the effect of a law professing to restrict the right of the state to the disposal of vacant lands varies according to the interpretation which practice places on 'vacancy';¹ on the other hand, an outright assertion of full state proprietorship over all lands² may, in spite of its apparent disregard for native rights, prove, when rightly used, to be the best machinery for protecting natives in the enjoyment of their lands. Again, the concession by the state of the claim that all land is, in some form or other, the subject of native rights, may be detrimental to natives themselves, if the state carries its respect for their rights to the extent of refraining from legislation to secure control over alienations to Europeans or 'stranger' natives.³ It is important that a study should be undertaken, on much more comprehensive lines than has been possible here, of the action taken by different African administrations in regard to land; but the important chapters of that study will deal less with the legal and juristic aspects of the rights which governments have asserted, than with the economic and social consequence of the uses to which they have put these rights.

(u) *The Reserve Policy*

In the British territories the consequences of the alienation of lands are most conspicuous in the areas where the reserve policy has been adopted—namely, the Union, the Rhodesias, and Kenya;

¹ See above, pp. 784 ff. and 790 ff.

² See above, pp. 763 ff. and 773-4.

³ See below, p. 855.

they are to some extent also seen in Nyasaland, but in other British territories alienation has had relatively less effect on native life. The principle of possessory segregation, in its fullest form, has two objectives: the reservation of lands for European occupation, and the eventual exclusion of the native from European lands, save for his employment as wage-earner or tenant labourer. Segregation¹ may be said to be in full operation in the sense that the limits of European and native areas respectively have now been fixed; the measure of segregation effected, however, does not amount to a complete territorial separation, since the holdings of the two communities are in most cases intermingled. In the Union it is only the Transkei Territories and part of Zululand which can be said to constitute homogeneous native blocks; in Southern Rhodesia,² though there are some large blocks of native land, a number of reserves are interspersed in European areas; the highlands of Kenya, on the other hand, constitute a more or less homogeneous European block. In its second aspect this theory is not yet in complete operation; steps taken to remove the 'squatter' have advanced further in the Union than elsewhere,³ but it is clear that both in the Rhodesias and Kenya the policy of removing the squatter must be subjected to some considerable delay in execution.

The reserve policy may be viewed from two standpoints: its efficacy for achieving the purposes for which it was designed, and its effect on native life. In the Union the policy of curtailing the area of native lands received, at the outset, considerable support from farmers and later from industrial employers, who held that to limit the land available for native subsistence would increase the labour supply. It is clear that the system must have given employers a larger body of labour and on lower terms than would have been possible had natives been allowed to retain large areas for their subsistence. Further, there is from the employers' point of view the substantial advantage that the reserve serves as a 'shock absorber' in the sense that it provides for the unemployed, the infirm, and the aged without any charge on the state. While allowing this to be the fact, it is not easy to measure the degree to

¹ See above, pp. 721 ff.

² See above, pp. 724-5.

³ See above, pp. 732-8.

which the curtailment of the area available for native occupation is responsible in modern conditions for increasing the supply of labour. In Chapter XI figures have been given showing the extent of the exodus of wage earners from the reserves, but it is clear, as has there been shown,¹ that factors other than the restriction of land now operate to produce this movement: the most striking illustration can be found in Bechuanaland, where there is a considerable annual exodus though the areas of land in native occupation have not been curtailed; again, the migration from Northern Rhodesia and Nyasaland is due to general economic conditions rather than shortage of land.

South Africa. Opinion in the Union now tends to lay emphasis on the existence of the reserves as a factor in the policy of social segregation, rather than on the influence it may exert on the supply of labour. That policy does not assume that there shall be no contact between the native and the European; when over one million and a quarter natives are occupied within the industrial system of the Union, there can be no question of the complete segregation of the two communities, and the practical objective is to make as full a use as possible of the native wage earner in the lower paid ranks of European employment, while allowing him to develop to the full, within the native areas, the opportunities which they offer to him for rising in the scale of economic life, as farmer, professional man, or craftsman.² The policy which regards the reserves as the appropriate field within which the native is to work out his economic and social advancement is perhaps in some quarters merely a doctrine of expediency; there can be no reason to doubt that in others it represents a genuine belief that the native can in this manner secure for himself the best position available to him under the conditions introduced by a dominant white civilization. The difficulty which an observer must feel in regard to this aspect of the reserve policy lies in the evidence of the limited possibilities which the reserves offer for any substantial improvement in the conditions of those who are resident in them.

In some of the reserves there is marked congestion:¹ the density in the Transkeian Territories as a whole has been officially estimated as 58.1 per square mile; in the Ciskei it is 57.15; but in certain parts it is higher, being as high as 70.1 in the Kingwilliamstown District; it must be noted, in addition, that large areas in the Transkei are hill or ravine. The density in Zululand is 33.70, and in the rest of Natal, 48.19 per square mile, as against 20.3 for the Union as a whole. Figures of density, however, are of limited value as evidence; their relevance depends on the type of rural economy practised in the area to which they refer. In the course of the inquiries which followed the Land Act of 1913, the Eastern Transvaal Local Committee calculated that a minimum of 38½ acres per family was required; the Glen Grey Act of 1894 allowed 8 acres per holding for arable, besides grazing, the proportion assigned to grazing being 70 per cent. of the whole location. But estimates of this kind break down when applied to areas including wide differences of soil and climate; the best testimony of the condition of the Union reserves is that to be found in the report of the Native Economic Commission,² which made a personal examination of them. In point of rainfall and quality of land they are not, in the view of the Commission, inferior to the average land in the Union. Nevertheless, the report states that, in the reserves, 'with few exceptions, the carrying capacity of the soil for both human beings and animals is definitely on the down-grade; a state of affairs which, unless soon remedied, will within one, or at the outside two decades, create in the Union an appalling problem of native poverty'. Some of the areas are already far from self-supporting, and it has been estimated that the native population as a whole (including, of course, those in the towns) consumes 8,000,000 bags of maize more than natives produce.³ It has to be realized that the pressure on the reserves will, in normal circumstances, be increased with the pursuance of the measures against squatting; it has been calculated that they may eventually result in a return of at least 120,000 natives to the reserves.⁴ Again, the most casual observation of the

⁴ *Race Relations*, vol. ii, no. 4, 1935, p. 8.

Union reserves demonstrates the grave injury done to the soil by erosion.¹

The need for an extension of the reserve area was recognized by the Native Economic Commission, and the enactment of the Native Trust and Land Act of 1936² shows that there is now a general acceptance of the statement made by General Smuts³ in 1929, that 'the mistake we made in South Africa in the past was our failure in not securing sufficient land for the future needs of the rapidly increasing natives; and the land problem that we have in consequence on our hands is one of the most difficult'. But while the addition of the 'released' area of 15,344,000 acres contemplated in the Act of 1936 will eventually improve the situation, it is clear that the problem is not merely the result of insufficiency of land. There is an urgent need for expenditure on anti-erosion work, the improvement of systems of water-storage, and on the extension of agricultural instruction, with a view to the substitution of more intensive cultivation for stock-raising. Until recent years the question had not received serious attention from the Union Government, and for the most part such expenditure as was incurred was provided by the native councils. As is shown elsewhere,⁴ the Transkei and Pondoland Councils were responsible for the foundation of the Tsolo, Teko, and Flagstaff agricultural schools, largely with the aim of educating native demonstrators; the expenditure of the United Transkeian Territories General Council on agricultural schools and farms during the twenty-two years ending June 30, 1935, amounted to £319,566. The councils maintain a Director of Agriculture for their own area, and also provide considerable sums for dipping operations and for anti-erosion work, fencing, dams, and tanks; the expenditure on dipping between 1903 and 1935 amounted to £635,058, and on the other services to £671,241.

The assistance received from the Union Government in the period 1910-34 for development in reserves was limited to a grant of £49,000 from loan funds and £346,000 from revenue for fencing and dipping-tanks, together with a sum of £228,821 for land purchases. But the attention directed to the condition of the

¹ See Chap. XVI, p. 1083.

² See above, p. 724.

³ *Africa and Some World Problems*, 1930, p. 60.

⁴ Chap. IX, p. 355, and Chap. XVI, pp. 1079 ff.

reserves by the Native Economic Commission in 1930 and 1931 led to a change of policy; the government authorized expenditure from the Native Development Fund¹ on agricultural instruction, and from 1930 to 1935 the general account of the Fund provided £88,444 for this purpose, and has been responsible for the maintenance of the agricultural school at Fort Cox, started in 1930. The Native Affairs Department has also spent certain sums from general revenues on measures against erosion, including the provision of dams; it has appointed a Controller of Native Settlements, a Director of Native Agriculture, with four Deputy or Assistant Directors, and a Senior Departmental Engineer with eight engineers under him. It has built up a large field staff both on the agricultural and on the engineering side to deal with conditions in the reserves and in the 'released' areas.

The passing of the Land Act of 1936 was marked by a further advance in the position of government; the statement² issued by the Native Affairs Department in 1937, after referring to the 'appalling' condition of the reserves, emphasized the urgency of measures for their rehabilitation, and announced that a detailed survey was being undertaken for this purpose. The expenditure so far undertaken by the Union Government on the reserves admittedly bears no comparison with the large direct and indirect outlay (estimated to amount to over £100,000,000 from loan votes and revenue between 1910 and 1936)³ on assistance to European farm interests; the evidence of a growing measure of recognition of native needs is all the more to be welcomed. That there is a wide field for improvement is obvious; but at the same time it must be realized that the reserves, even under improved conditions, must be subject to the limitations which apply to the general agricultural conditions in the Union. There are large areas suitable only for the raising of cattle or sheep; this, in the soil and climatic conditions of the Union, demands extensive grazing grounds; and the productivity of the arable areas is low, as compared, at all events, with the better lands of Southern Rhodesia or Kenya. Improvement of the reserves will undoubtedly improve the native

¹ See Chap. IX, p. 369.

² *Statement of Land Policy under the Native Trust and Land Act, 1936.*

³ S. H. Frankel, *Capital Investment in Africa, 1938*, p. 120.

standards of living; but it remains to be seen whether the reserves can ever offer those opportunities for social development which some advocates of the policy of segregation seem to have envisaged.

Southern Rhodesia. In Southern Rhodesia the effect of alienation has been less marked than in the Union. The density of the population in some forty reserves was estimated in 1935 to vary from $2\frac{1}{2}$ to 60 per square mile, the average for the combined areas being 20 to the square mile; it has been estimated that here the economic size of holdings should range from 10 to 50 or 60 acres per head of the native population.¹ While the provision made is more liberal than in the Union, there is nevertheless evidence of deterioration in some of the reserves; the annual reports refer to the fact that they contain less arable than was expected, and that certain areas have begun to be characterized by conditions of overgrazing, worn-out land, and loss of top soil. Importance accordingly attaches to the policy initiated of 'centralizing' arable and grazing lands, already said to be yielding good results, and to the provision of agricultural demonstrators,² and the increase of water facilities.³ It is clear, also, that more energetic efforts are required to deal with tsetse fly in certain of the reserved areas. Though the acreage under cultivation is estimated at 1,388,892 acres, the yield is at present of a low standard and, as experience of the system of demonstration plots has shown, is clearly capable of improvement. The expenditure on the reserves in 1935-6 amounted to £8,936, with £6,485 from Native Funds, but in the year 1936-7 the sum of £22,000 was voted for water-supplies and soil conservation in native reserves; and a staff of two European Agriculturists, a Forest Officer, a Soil Erosion Officer, a Water Conservation Officer, two Land Inspectors, and ninety-two Native Agricultural Demonstrators are engaged in general development work in the reserves. Although up to 1937 expenditure for these purposes has amounted to £138,154,⁴ it would still appear to be inadequate in view of the needs which official reports disclose.

Northern Rhodesia. In Northern Rhodesia the movement of natives into the reserves, which has been in progress for some years, is not completed, and conditions are not yet fully stabilized.

¹ A. C. Jennings, op. cit., p. 303.

² See Chap. XV, p. 1039.

³ See Chap. XVI, p. 1087.

⁴ See Chap. XVI, p. 1087.

Although the Land Commissions,¹ in allocating the reserves, took into consideration the future needs of the tribes, the circumstances in which they were delimited have led to unequal results; the density of population was given in 1931 as 6.89 in the railway area reserves, 8.5 in the Tanganyika province, 38.7 in the North Charterland Concession, 16.0 in the eastern and 12.0 in the western part of Barotseland. It was admitted in 1930 that some of the reserves had already proved too small, and that there were large areas alienated to Europeans in which no development was taking place.² Not only are some of the reserves congested, but as a result soil conditions have deteriorated; there are some, such as those in the Broken Hill area, where natives have to rent land for grazing outside the reserves; it was remarked in 1936 that in some of the reserves near the copperbelt the land would shortly become useless unless the area was extended, or natives allowed to move elsewhere, and Sir Alan Pim in 1938 stated that additional areas were required.

The inequality of distribution to which these facts point is, as the discussions which took place on the subject in Nyasaland emphasized, one of the inevitable consequences of the reserve system, which permanently fixes tribal areas, and makes no provision for changes in the population or in economic development. In the circumstances of Northern Rhodesia much should be gained by the adoption of the more elastic system now under consideration,³ which would permit, as in Nyasaland, of a redistribution of areas, subject, however, to the guarantees given to tribes when the reserves were first constituted, that they would not be moved without their own consent. Meanwhile, it is clear that the chief need of the reserves is the development of their water-supplies;⁴ a number of dams and wells were constructed in the years 1930-3, but the programme contemplated by the local administration has been curtailed for financial reasons. The budget of 1935 provided a sum of £1,907 for this purpose, but a larger outlay is obviously required. There has been little improvement of methods of cultivation in the reserves and there appears to be a need for the extension of agricultural instruction. Sir Alan Pim in 1938

¹ See above, p. 740.

² *Governor's Address to the Legislative Council, 1930.*

³ See above, p. 741.

⁴ See Chap. XV, p. 1041.

recommended a comprehensive programme of rehabilitation and control of methods of cultivation as well as carefully planned measures for water conservation, and the provision of additional supplies, based on a technical survey.¹

Kenya. As has already been remarked, the effects of alienation in Kenya are local rather than general. While the density of population in the Masai reserve is only three per square mile, the three districts of Kikuyu have a density of 283, and the three Kavirondo reserves an average density of 145; there is one area in North Kavirondo (Bunyoro) which exhibits the exceptional figure of 1,140 per square mile. But in Kenya, where there is great variety of climatic and soil conditions, the density in the reserves is only one of the factors which have to be taken into consideration in judging the effects of alienation. It is probable, indeed, that the greater part of the population must always have been concentrated in the area near Lake Victoria now held by the Kavirondo, and in the central regions occupied by the Kikuyu and related tribes and by the Kamba; these groups number to-day 2,230,192, and the balance of the population—namely 782,229—is distributed over a large number of tribes, including those on the coast. Again, though the European occupation of the highlands may have curtailed the possibilities of expansion by the Kavirondo, one of the most densely settled tribes, their own lands were not reduced by this process, save for very small areas acquired for public, missionary, or trading purposes. It is more important to note the prevailing conditions of the reserves. The reports of the Agricultural Commission, presided over by Sir Daniel Hall,² and of the Land Commission of 1933,³ make it clear that in certain areas there is already a dangerous degree of soil deterioration,⁴ mainly attributable to overstocking; the latter Commission held that, unless this process were stayed, some of the reserves would be irretrievably ruined, and the inhabitants reduced to a state bordering on starvation. Overstocking must be understood in the sense not only that more cattle are put on the land than the supply of grazing warrants, but that the cattle are of little economic value

¹ *Report*, op. cit., Colonial 145, 1938, p. 74.

² *Report of the Kenya Agricultural Commission*, 1929.

³ *Report*, op. cit., Cmd. 4556, 1934, Part III, chap. i and x.

⁴ See Chap. XVI, p. 1098.

to their owners. There were, however, in the view of the Commission great variations in the extent of the mischief; while, for instance, in certain reserves, such as the Kamasia, the condition of the grazing land was found to be deplorable, there were others in which deterioration was said to be far less marked; and it was considered by the Commission that, in many cases, the unsatisfactory conditions were the result of maldistribution rather than of shortage of land.

The problem is admittedly one of great complexity. Any measure which proposes to make possible a redistribution of the reserve lands in proportion to the needs of the different tribes would encounter objections based on the fact that certain of them, such as the Masai, have been guaranteed the exclusive use of their lands, and that land in such reserves cannot be granted to other natives without the consent of the tribal representatives. The history of the Kenya reserves has been such that it might well prove undesirable now to revive mistrust in the intention of government by suggesting any extensive measure of redistribution or change of boundaries. In discussing possible extensions of area, the Land Commission of 1932 was doubtless influenced by what it regarded as commitments made to Europeans in respect of the highlands,¹ but it also had reason to feel that, apart from any question of right, an extension of area would not necessarily form a solution for the problem of the reserves. Writing in 1914, Sir H. Belfield² held that the 'natives' pernicious pastoral proclivities' should not be encouraged by the grant of more land for grazing purposes. That, perhaps, was an extreme view which did not take into account the position occupied by cattle in the life of the native; but if the Commission is right in attributing the deterioration in the reserves to overstocking, an extension of area might prove only a temporary palliative; the immediate necessity is to reduce overstocking by judicious use of culling and other methods,³ to protect the soil by the introduction of rotational grazing, and to substitute, where soil and climatic conditions permit, and with due respect to the requirements of native custom, an agricultural for a pastoral economy.⁴ It may well be argued that until a serious

¹ See above, pp. 749-53.

² Dispatch to the Secretary of State, Apr. 3, 1914.

³ See Chap. XVI, p. 1095.

⁴ See Chap. XVI, p. 1096.

effort has been made in this direction, the addition of new areas, at all events in the case of certain of the reserves, would produce no permanent improvement. The Agricultural Department which, at the outset, paid little attention to the needs of natives, extended its organization between 1923 and 1929 in order to deal more fully with questions affecting them, and has of recent years undertaken a programme of work designed for the improvement of conditions in the reserves,¹ and in 1937 obtained a grant of £34,000 from the Colonial Development Fund in connexion with the reconditioning of the Ukamba reserve.² Until it has been seen how far this programme can be made generally effective, no final judgement appears possible as to the results produced by the present distribution of land; but it is also true that the state of some of the reserves renders the pursuit of these measures one of the most pressing obligations of the administration.³

Other Territories. In Nyasaland, where some 5 per cent. of the total area has been alienated,⁴ the main problem lies in the adjustment of the status of the large number of natives who are resident on the European farms in certain districts. The reserve policy has not been adopted either here or in any of the other British dependencies in Africa. In the Belgian Congo the concessions extending over large areas of land have so far resulted in a relatively small measure of actual dispossession, and it remains to be seen how far the present policy will lead to a more direct measure of control over the lands lying within the areas conceded for occupation by Europeans or for cultivation under the plantation system. Physical and climatic conditions will necessarily restrict the former, and it is, indeed, mainly in the area under the management of the *Comité du Kivu* that it is favoured by suitable conditions. On the other hand, the value of large-scale plantations for oil-palm or coffee, as compared with systems of native production, remains to be tested in the light of a longer experience than has hitherto been available. In the French colonies the effect of alienation is likely to be confined to certain parts of the Ivory Coast or French Guinea, though it

¹ See Chap. XV, p. 1042, and Chap. XVI, p. 1096.

² See Chap. XVI, p. 1098.

³ *Report of the Commission on the Financial Position and System of Taxation of Kenya*, Colonial 116, 1936, paras. 242 and 254.

⁴ See above, p. 756.

may be noted that even here grants are as a rule small in extent. In the French Cameroons, on the other hand, the administration has already begun to recognize the need for delimiting areas in which further concessions for plantations cannot be allowed, and there is every indication that the process needs to be extended.

(v) *European Land Settlement*

It is obvious that in some territories, as for instance the colonies on the West Coast, alienation must be viewed mainly in its economic aspect; the justification for the withdrawal of land from native occupation is to be measured by the relative contribution made to general welfare, either directly, by the greater production of the alienated lands and the employment given to wage-earners, or indirectly, by the increase in native production from the adoption of improved processes introduced by European management. But in territories such as South Africa or Southern Rhodesia policy has a social as well as an economic objective. Even were it to be demonstrated that there would be an economic advantage in devoting to native production some of the areas now reserved for Europeans, or that by restoring a part of the alienated land to natives their value as consumers would be so enhanced as to benefit the population as a whole, the argument would not be decisive; it would meet the reply that a reduction of the European area would militate against the policy which regards it as essential to maintain a resident European community at a certain level both in regard to numbers and standards of living. It is, nevertheless, of interest to examine some of the economic aspects of the procedure adopted by the countries mentioned in making alienations of land.

South Africa. In this respect the land policy of South Africa appears to be marked by three stages. The original grants of land were not made on any definite plan; in the earlier days the areas given on the coast proper were comparatively small, but as trekking extended settlers were allowed to occupy a 'half-hour radius' area, which was taken at a normal standard of 3,000 morgen or approximately 6,000 acres; there was no survey available, and under the *leenings-plaats* system¹ no title-deeds were given, land

¹ W. M. Macmillan, *op. cit.*, 1927, p. 84.

being held without fee on a theoretical one-year lease, which was converted into quit-rent tenure under Cradock's Proclamation of 1813. Many of these holdings were subjected to subdivision under the Roman-Dutch law of inheritance; but there were at the same time many instances, especially in the drier areas suitable for sheep-breeding, where larger areas were accumulated in single hands, farms ranging from 10,000 to 20,000 acres being not uncommon. The size of holdings and the nature of the tenure were determined by the political circumstances under which settlement took place, and by the requirements of the pastoral economy then prevailing; but land had not yet acquired a negotiable value and was sought mainly by those who required it for their own occupation.

A new factor was introduced in the Transvaal by the growth of the gold industry. Land became an object of speculation, and large areas were acquired by companies either from the state, or by purchase from farmers whose interests had been diverted from stock-raising to transport-riding or other occupations connected with the mines. A second stage may be said to have been initiated by the scheme of reconstruction adopted after the Boer War; economic conditions had broken down in the Transvaal and part of the Free State, and for the first time steps were taken to secure a more systematic development of the lands available. The Crown Lands Disposal Ordinance and the Settlers Ordinance of 1902 created a Land Department in the Transvaal, which had at its disposal about 29,000,000 acres of Crown land, but of this 19,000,000 acres were unsurveyed and all the area was imperfectly developed.

A Land Board was set up in 1907 to manage settlement in the Orange Free State, mainly under the Land Settlement Ordinance of 1902. It was part of Lord Milner's policy to attract settlers from outside; an important feature in this policy was the grant of state assistance to new settlers for development purposes, while the returning farmers were assisted by the new Land Bank created in 1908.¹ As was pointed out, however, by the Transvaal Indigency Commission of 1906-8,² there was in reality a wider problem involved; the farm system had already become uneconomic, and a readjustment was required both in the system of tenure and the

¹ The provincial Land Banks were merged into the Land and Agricultural Bank of South Africa in 1912.

² *Report*, T.G. 13, 1908, p. 95.

methods of agriculture in order to secure a more beneficial use of the land. The Milner Land Settlement schemes in the Transvaal and Free State had a limited result; the holdings given were small as judged by former standards, being only between 300 and 500 acres in extent, and altogether only about 1,000 settlers were working under the scheme at the time of Union. But the scheme formed the basis of the measures which characterized the third stage of development, the closer settlement policy introduced by the Land Settlement Act, passed by the Union Government in 1912.

The Transvaal Indigency Commission had recommended, among other measures, that a more beneficial use of the large areas held by farmers and companies should be secured by a graduated tax on unimproved land values. But proposals for land taxation have never been acceptable in South Africa. Whereas the pre-Union statutes had been confined to operations on Crown lands, the Act of 1912, under sections 10 and 11 respectively, provided for closer settlement by the purchase and re-allotment of land by the state, and for the purchase of specified farms at the request of individual applicants. The objective was in part economic, but the policy was also largely influenced by the desire to provide for the growing body of Europeans of South African origin, many of them of the poor white class, whom changes in the system of agriculture or the subdivision of older holdings had deprived of employment on the land. A considerable expenditure was involved, not only in the repurchase by the state of large areas of alienated land, but in the grant of an increased measure of assistance to those settling on it.

The policy did not necessarily exclude immigration; indeed, immigration has been stated to be integral to the welfare of the country, and considerable numbers of immigrant settlers are received annually. It would seem that one organization, the 1820 Memorial Settlers' Association, was responsible for the introduction of 7,000 settlers in the period 1911-35. From the date of Union up to 1935 the state had allotted an area of 35,022,230 acres to 17,889 persons, the valuation placed on the land allotted being £13,908,204. Of the total allotted, the greater portion—namely, 19,737,130 acres—was obtained by purchase under the two alternative systems provided by sections 10 and 11 of the Act of 1912, only 6,975,340 acres

being allotted under the Transvaal Crown Land Disposal Ordinance of 1903. It is not easy to judge from the figures published how far the action taken under these measures has been effective in promoting closer settlement. In 1935 there were 54,944 farms of less than 500 morgen (1,058 acres) occupying 21,701,000 acres, and 44,322 farms of over 500 morgen occupying 188,106,000 acres; thus about 90 per cent. of the total alienated area of 209,807,000 acres is held by about 45 per cent. of the owners.¹ These figures, however, include the extensive areas still held by land companies in the Transvaal and the owners of large sheep farms in the dry areas.

The expenditure incurred on land settlement proceedings has been analysed in the report of the Settlers Relief Commission, 1934.² By a series of amendments to the Land Settlement Act of 1912, ending with No. 57 of 1934, the amount advanced by government for the purchase of land has been increased to nine-tenths of the price, leaving only one-tenth to be found by the settler; the obligations in regard to beneficial occupation have been gradually reduced, and the arrears of the debt owed by settlers to the state have twice been capitalized, with the result of a substantial write-off on each occasion. The sums actually written off up to March 31, 1934, amounted to £1,619,049, and the total capital debt to be recovered had grown to £7,500,000, while the settlers, less than three years after the second capitalization, and in spite of assistance provided by numerous relief measures, were again in arrears to the extent of £724,000. In view of the course taken in the past in regard to these liabilities, and of the present political conditions in the Union, the major part of these arrears must clearly be regarded as irrecoverable. An amending Act 25 of 1931 enabled the majority of lessees to postpone the repayment of the purchase price until 1965, their obligation being confined to the payment of 4 per cent. per annum on the capital debt; Act 57 of 1934, however, restored for new lessees the principle of purchase price redemption during a period of forty years. It must further be noted that the above sums are independent of the large assistance given to farmers through the Land and Agricultural Bank, or otherwise.

¹ *Official Year Book of the Union of South Africa*, 1934-5, pp. 377, 478.

² U.G. 25, 1935.

It is not necessary at this point to examine in greater detail the course taken by the land settlement policy; it is clear, however, that from the first, policy has not made it possible either to impose an effective tax on land or to insist on the adoption of more intensive methods of farming. The cost of the settlement policy has been increased by the fact that land was frequently purchased by the state at an uneconomic figure, and by remissions of arrears necessitated by unusual conditions, such as drought or locusts. But there is perhaps no state in the world which has been able to allow purely economic consideration to outweigh the claims of social schemes which have strong political support, and the land policy of the Union is pre-eminently a scheme of this nature.

Southern Rhodesia. In Southern Rhodesia the British South Africa Company disposed of extensive areas of land to companies and to members of the pioneer and police forces; the latter grants were made in recognition of services rendered, and no purchase price was paid, but the holder was liable to an annual quit-rent. In the case of other early alienations the general terms were a purchase price of 1s. 6d. per morgen in Mashonaland and 3s. in Matabeleland, with a quit-rent of £3 per 1,500 morgen (3,000 acres), and 4s. for every additional 100 morgen. The titles usually contained a 'beneficial occupation' clause, which could be eliminated if the grantee, or a European substitute, occupied the land for a period of three years and erected buildings to the value of £200. The Land Occupation Conditions Ordinance of 1900 allowed the holder to obtain exemption from the occupation condition by paying an annual fine for ten years; and, under Government Notice of November 13, 1903, individuals or companies holding land upon occupation tenure could, by surrendering one-third of their holdings, obtain title to the remainder free of the condition of occupation. In terms of this notice, which was withdrawn in 1905, a total area of 374,245 morgen reverted to the category of unalienated land. The British South Africa Company selected large estates for farming on its own account, including the Rhodesdale (1,000,000 acres) and Nuanetsi (2,500,000 acres) for stock-raising, the Marandellas (35,000 acres) for tobacco planting, and the Sinoia (60,000 acres) and Primer (9,000 acres) for citrus. In 1909 an area of 800,000 acres was granted to the Oxo and Lemco Companies for cattle farming. In 1914,

of an estimated area of 59,000,000 acres situated 3,500 feet or more above sea-level, the region considered suitable for European occupation, about 32 per cent. had been alienated, and 27 per cent. was reserved for native occupation. For marketing purposes the most desirable lands, comprising some 33,000,000 acres, lay within a zone of twenty-five miles from the railway line; of this area, 50 per cent. had been alienated, and 24 per cent. was reserved for the natives. It was recognized at an early stage that a large number of farms were too big to be developed by the holders with the capital at their disposal; in 1913 legislation was introduced to place a tax on unimproved land, and to establish a Land Settlement Board with power to acquire undeveloped land, primarily in the twenty-five mile zone, at a price fixed by compulsory arbitration. The Bill, however, was abandoned.¹

Land settlement schemes were not organized until after the War, when a small number of ex-soldiers acquired farms on special terms; the government also took advantage of the terms offered by the Empire Settlement Act of 1922, and introduced various assisted schemes, under which 205 settlers took up land in the period 1925-31, of whom 142 were still on the land at December 31, 1931. Of the expenditure involved, half was borne by the British Government. The 1931 census showed that 4,325 Europeans, or 8.67 per cent. of the white population, were engaged in agriculture. Although the production of maize and tobacco and the rearing of cattle have been developed steadily, the proportion of the occupied European population engaged in agriculture is substantially less than that in the Union, and the slow rate at which settlement has taken place is expressive of the difficulties encountered by the farming community since the first outbreak of rinderpest in 1896.

The Rhodesia Land Bank Limited was formed by the British South Africa Company in 1912; loans amounting to £155,288 in respect of farm mortgages were described in 1933 as being to a considerable extent 'frozen' capital, which would be realized only when conditions improved in the industry. Soon after the grant of responsible government, a State Land and Agricultural Bank was established under the Land Bank Act, 1924, with an initial

¹ S. H. Frankel, *op. cit.*, chap. iv.

capital of £300,000, subsequently increased to £970,000. At the end of 1935 the amount owing to the Bank was £982,243, of which £828,706 represented mortgage loans and £42,881 interest due and payable. The Bank, furthermore, administers special funds placed with it by government for assisting applicants who are unable to obtain relief under the Land Bank Act; at the end of 1935 these loans amounted to £124,380. A committee appointed in 1934 to inquire into the position of the agricultural industry reported¹ that, while it was not possible to ascertain the exact financial position of the farming community, there could be no doubt that comparatively few farmers were solvent at the existing market value of their assets; much of the land was heavily encumbered with mortgage, and farm areas were excessive in extent.

Kenya. It has been mentioned that at the outset the encouragement of European settlement in Kenya was in large part due to the desire to establish in the vicinity of the railway line a population that would provide sufficient traffic to repay the heavy outlay on its construction.² In the early stages the home government attached minor importance to the national character of this population, as is shown by the fact that in 1903 it proposed to make a free grant of some 5,000 square miles to the Zionist Organization.³ The desire to attract colonists accounted for the repeal of the Land Regulations of 1897, which permitted only short-term leases (twenty-one years) with stringent development conditions, and for the provision for grants in freehold under the Crown Lands Ordinance of 1902; the first freehold grants were of homesteads of 160 acres, to which a pre-empted area of 480 acres was added on payment at the rate of two rupees per acre, and the fulfilment of prescribed conditions of development. In 1903 and the following years, free grants were offered of agricultural land in lots of 640 acres, and of stock-farms of 5,000 acres. In addition, larger areas were leased on easy terms, the most conspicuous being 320,000 acres of grazing land near Naivasha taken up by the East African Syndicate, 100,000 acres adjoining them which formed Lord Delamere's original estate, and the Grogan Forest Concession of 200,000 acres. In 1905 East African Estates Limited obtained a

¹ *Report*, C.S.R. 16, 1934, paras. 7, 272.

² See above, p. 743.

³ See above, p. 745.

ninety-nine years' lease of 200,000 acres on the coast, and 100,000 acres in the Teita District; by a readjustment in 1925, the area leased on the coast was reduced to 100,000 acres in consideration of the grant of additional areas elsewhere. The maximum lease remained at twenty-one years till the Crown Lands Ordinance of 1915 extended the period to 999 years. By that time, however, the period of alienation of land in large blocks had come to an end. One further large-scale settlement plan was launched in 1919, when a total area of 4,560 square miles was offered to discharged soldiers in 257 small farms of 160 acres, free of purchase, and 1,053 larger blocks for purchase on easy terms.¹ Except for grants made under this scheme, no land has been allotted in freehold since 1912, and since that time no large-scale alienations have been made, though the total area alienated increases slightly from year to year.

By the end of 1935, 6,768,000 acres had been alienated. No detailed figures regarding the state of development of this land have been published since 1934. At that time the total alienated was 6,543,360 acres; of this, 1,405,036 acres were unoccupied. The remaining 5,138,324 acres were held by 2,027 occupiers, giving an average of 2,534 acres per occupier. The area 'developed' was officially estimated at 1,410 acres per head, being 274 acres under cultivation, and 1,136 under stock. The total cultivation was thus 556,182 acres or 11 per cent. of the whole, having fallen from 643,644 acres in 1930. Reference has already been made to the discussions which took place between 1904 and 1915 on the subject of reducing land speculation, and the efforts made to secure a more beneficial use of the large areas alienated. In 1908 the Colonial Office proposed the imposition of a surtax on large holdings,² but in view of local opposition the proposal was abandoned in 1913, and has not since been revived.

State assistance to agriculture has in Kenya taken the form of protective duties, favourable railway rates for exports, and the exemption from customs duty of agricultural machinery. Of recent years the problem of agricultural indebtedness has been a serious one. The total agricultural debt of the colony at the end of 1932 was estimated by the Agricultural Department to be between

¹ *Annual Report*, 1919-20; see also W. MacGregor Ross, *Kenya from Within*, 1927, p. 81.

² *Op. cit.*, Cmd. 4117, p. 30, 1928; *op. cit.*, Cmd. 2629, 1926.; see also above, p. 746.

£4,000,000 and £5,000,000.¹ Since the depression of 1929 a number of special relief measures have been introduced. In 1929-30 reduction of railway rates on cereals was made to a total of £98,000, and rebates on maize amounted to £15,071. In 1930 a special loan to maize exporters was authorized by Ordinance 17: the amount outstanding in 1935 was £116,090. In 1930, also, an Agricultural Advances Board was created for the purpose of making advances to farmers in difficulties: its functions were taken over in 1934 by the Land and Agricultural Bank, established in 1931. In 1936 the amounts originally fixed as the limit of advances were raised: the maximum advance for the discharge of an onerous mortgage was increased to £3,500, and the maximum for general purposes to £5,000; advances up to £200 were authorized for anti-erosion work. By the end of that year £631,260 had been advanced in long-term loans, of which £45,160 had been repaid, and £13,825 in short-term loans, of which £2,165 had been recovered. Of the total advanced in long-term loans, £282,907 were devoted to the discharge of existing mortgages. The total sum advanced under the Agricultural Advances Scheme was £139,646, of which £22,735 had been written off and £30,440 recovered. An Agricultural Mortgages Relief Ordinance of 1934 imposed a moratorium on mortgages for two years; in 1936 this was extended for another year, and the Governor was empowered to make further extensions. In 1935 a committee was appointed to recommend measures to lighten the burden of agricultural indebtedness, and as a result of its proposals a Farmers' Conciliation Board was established by Ordinance 18 of 1936, which is empowered to make advances to farms threatened with bankruptcy, the funds being placed at its disposal by the Land Bank.²

(w) *The Control of Alienation*

The preceding pages have been devoted mainly to a study of the methods followed by states in obtaining land for public purposes, or for alienation to non-natives, and attention has naturally concentrated on those territories in which a policy of colonization has

¹ *Kenya Land Commission, Evidence and Memoranda*, vol. iii, Colonial 91, 1934, p. 3075.

² For the general question of expenditure on agriculture, see S. H. Frankel, *op. cit.*, chap. iv.

created large demands on the state for the provision of lands. In other areas, such for instance as the British or French colonies in West Africa, alienation to non-natives may now be said to present problems of administrative detail rather than of general policy; unless some change of circumstances, of a type which cannot now be foreseen, creates an interest in colonization, their governments are not likely to be faced with the demand for the assignment of large tracts of land for Europeans. There is a party in Belgium which favours a policy of colonization in the Kivu area of the Congo, but it still remains to be seen if its scheme can be carried into execution. On the whole it seems probable that the future of non-native enterprise, at any rate in these territories, lies in commercial and industrial enterprises, or in mining, or plantations of limited size, developments none of which necessitate alienation of land on an extensive scale. The relative advantages of the plantation system and of native peasant production need not be discussed here; it is necessary here to refer only to the problems which will arise when policy recognizes the need for providing land for purposes such as those indicated. Though in most territories there are considerable areas which are sparsely populated, and in which accordingly it might be possible to satisfy demands of this nature without serious disturbance of native life, it is nevertheless necessary to safeguard existing native rights and to provide adequate relief when they are disturbed.

Two different situations have to be considered. The first and most common is that arising in areas where the state claims rights over all land, as for instance in the northern provinces of Nigeria, or over all 'vacant' lands, as under the French and Belgian systems, or again, where it retains in its own hands the legal ownership of lands in the native reserves. In these circumstances natives cannot normally invoke judicial processes to prevent the alienation of their land to non-natives.¹ This position is the legal consequence of the assumption by the state of ultimate proprietorship; the safeguards for the preservation of such rights as individual natives may possess *vis-à-vis* the state lie in the administrative regulations controlling the procedure to be observed before native lands can be alienated, or in legal provisions, such as those existing in Kenya,

¹ For exception see the Tanganyika Law quoted on p. 824.

placing a statutory body in control of alienation from the reserves. In these circumstances the decision as between the state and native rightholders must remain in the hands of the executive, and the nature of the process by which the rights of occupiers of lands are determined becomes of first importance, the more so as experience has shown that in the past too little importance has been attached to such rights as those of occasional occupation, which is a regular incident of the system of shifting cultivation, or of grazing, or of access to water facilities. In South Africa regulations under the Native Trust and Land Act of 1936¹ define the conditions subject to which sites in the reserves may be alienated for missionary, educational, or trading purposes, and provision is made in the Act for the appointment of local boards, one member of which may be a native, to advise upon the acquisition and alienation of the land vested in the Trust. In Southern Rhodesia no native reserve or any portion thereof can be alienated without the permission of the Secretary of State, but it has to be borne in mind that this provision does not, of course, extend to mineral rights, which are owned by the Southern Rhodesian Government.

The Kenya Native Lands Trust Ordinance, 1930, constitutes a Central Board, to include where possible native membership and local advisory boards. Rights over land in a reserve² cannot be alienated without the consent of the Central Board following a reference to the appropriate local board and consultation with the native community; in certain cases, where there is local native objection, or where the proposed term exceeds ninety-nine years, the sanction of the Secretary of State is necessary. In Tanganyika the consent of the native authority must be obtained to alienations of land occupied by natives within its area,³ and a somewhat unusual provision is made for instituting legal proceedings if the executive's right to dispose of land is disputed.⁴ In Northern Nigeria the procedure is for the district administration to investigate and report upon any native rights that may exist in respect of land for which a non-native desires to obtain a right of occupancy,

¹ See above, pp. 722-5.

² *Ibid.*, pp. 751 ff.

³ *Land Development Survey Second Report, 1930, Iringa Province*, para. 12.

⁴ *Laws*, cap. 68, sect. 22.

and ascertain whether other land is available which is satisfactory to the occupiers, and the amount of compensation due.¹ It has been seen that in the Belgian Congo the law now prescribes that an independent assessor or a judicial officer should be associated in the inquiry, which is necessary before sanction can be given to a sale by a native to a non-native, and that a similar procedure has been adopted in the mandated territory of Ruanda-Urundi.

In making state alienations to non-natives the tendency in the British colonies has been to limit the grant to a leasehold tenure; thus though in Kenya the term of 999 years' leasehold is still maintained for agricultural land, the maximum term for town plots is ninety-nine years, and rents are revisable in 1945 and for each subsequent period of thirty years, with a maximum of 3 per cent. on the unimproved value.² In Nyasaland³ and Uganda,⁴ while sale is still legally permissible, the ordinary procedure is to give a lease up to ninety-nine years, with periodic revision of rental; in Tanganyika,⁵ Northern Nigeria,⁶ the Northern Territories of the Gold Coast,⁷ only a leasehold tenure is given, the period here also being up to ninety-nine years, with periodic revisions of rental. In most cases the conditions provide for proof of beneficial occupation; thus to take a typical instance, Tanganyika prescribes that for areas of over 300 acres of agricultural land, improvements to the value of £300, plus 4s. per acre for every acre over 300 acres, must be effected within the first three years, and additional improvements of half that value within the first five years. In Nigeria the usual conditions in agricultural leases require the lessee to bring at least two-thirds of the cultivable area under cultivation at the rate of one-eighth of the area each year.⁸ In the French territories a provisional title is given on an annual rental during a period of two to five years, which is made 'definitive' in the form of freehold title over the part of the area which has been developed, when the conditions as to beneficial occupation and purchase price are

⁸ *Revision of Instructions to Political Officers on Subjects chiefly Political and Administrative*, 1918, p. 368.

satisfied.¹ In French Equatorial Africa, if the land is abandoned for two consecutive years during the preliminary period, the concession may be cancelled. Concessions in the Belgian Congo may take the form of ninety-nine-year leases, the state reserving the right to take back undeveloped land at intervals of ten years,² or the land may be disposed of by sale or on fifteen-year leases, preceded in each case by a preliminary period of five years, during which developments must be undertaken according to a special standard.³

The policy on which the procedure now followed in British colonies is based has been the subject of much discussion by the different interests concerned. Government, on the one hand, has sought to limit the extent of permanent alienation to non-natives, and at the same time to gain for the state part of the incremental value in the land accruing from the growth of an organized economic and political system;⁴ on the other hand, as will have been seen,⁵ settler interests in Kenya objected at one time that a leasehold tenure of ninety-nine years afforded insufficient security for the investment of capital. The commercial interests which at one time sought concessions for palm-oil plantations in Nigeria rejected as inadequate the terms then proposed,⁶ namely, sixty years for building and twenty-one years for agricultural areas. Alienations intended to make provision for the permanent settlement of a European community must necessarily differ in their terms from concessions made for commercial development. In the former case, freehold or an extended term of leasehold is required, though it would still seem appropriate for the state to insist on reasonable terms of beneficial occupation, and to take its share of increased incremental values either by periodic revision of rental, in the case of extended leasehold, or land tax, or a tax on transfers in the case of freehold alienations. The leasehold tenure, with a maximum of ninety-nine years, now in force in British territories such as Nyasaland, Tanganyika, or the northern provinces of Nigeria, which do not look primarily to a colonizing policy,

⁶ *Report of the Northern Nigeria Lands Committee*, Cmd. 5102, 1910.

appears to confer a title adequate for commercial or 'plantation' development.

An entirely different situation arises where, as in Basutoland or Swaziland, lands have been left in native control, or where, as in the Gold Coast, the state has claimed for itself no rights in land, on the ground that there is no area over which native rights do not exist. Here acquisition by non-natives takes the form of private purchase, and various measures have been adopted in the British territories to exercise control over such transactions. Thus in Basutoland¹ and Bechuanaland,² land rights may not be alienated without the government's consent; in Buganda, the Land Laws of 1904 and 1908 require the consent of the Lukiko and Governor, and in the Gold Coast³ and Sierra Leone,⁴ transfers are supervised by Concessions Courts. Throughout the British areas, therefore, the sale of land by natives to non-natives has been brought under some form of control. As has been seen, that exercised through Concessions Courts, constituted on a judicial basis, has proved least effective; questions regarding the boundaries of a chief's authority, or regarding his power to alienate tribal land, are matters more suitable for executive than judicial decision. In the French⁵ and Belgian⁶ territories, sales by natives to non-natives have also been brought under control. In the French areas, however, this does not extend to lands held by natives in freehold under the process of *immatriculation*;⁷ further, the stipulation that previous administrative sanction must be obtained is chiefly designed to protect the rights of the state in the *domaine public*. The Belgian law, in addition to safeguarding the position of the state, provides more adequate safeguards for assessing the value of the property and establishing the equity of the bargain.

While provisions of this class have originated in the necessity for obtaining control over the sale of lands by natives to Europeans, they have another aspect, as providing some means of regulating the transfer of land to alien natives. The question is at present of importance mainly in the coastal districts of West Africa, since in

⁷ See below, pp. 858-62.

areas where the Crown retains the superior ownership it can regulate the transfer of rights by natives of the territory to alien natives. These powers have been utilized in the northern provinces of Nigeria to declare that there is no restriction on transfer between blood relations; the consent of a district headman is necessary for transfer to a non-related native of the same district, and that of an administrative officer for transfer to a native not resident in the district.¹ In the areas where the Crown does not claim over-proprietorship there is not the same means of controlling transfers, and sales to alien natives, particularly if they are money-lenders or speculators, may, with the growth of the conditions which give a negotiable value to land, constitute a danger to the structure of land-holding native groups. Indeed, in the Gold Coast injurious results have already followed the extensive alienation of cacao lands in the forest areas to natives of the non-forest areas. In the division of Akun Abuakwa, for instance, the inhabitants of neighbouring divisions have gradually acquired ownership of half of the Akun Abuakwa territory. Sales have often been negotiated in the Gold Coast by subordinate chiefs without reference to their head chiefs, and have resulted in continuous litigation between chiefs to establish their rights of sale.

A further problem has been created by disputes between the head chiefs as to the right of jurisdiction, it being maintained that the right of jurisdiction passes with the sale of land, a view supported by certain judgements of the Supreme Courts. This vexed question occasions friction and even riots, and it seems that only an executive order delimiting the respective spheres of jurisdiction will provide a solution. Experience may show the necessity of making some legal provision for a right of pre-emption in favour of the members of the landholding group, similar to those embodied in the pre-emption laws of some provinces in India, or, alternatively, of giving a somewhat narrower scope to the definitions of 'native' now appearing in some of the laws regulating the ownership of land. It is of interest to note that, according to the definition of the Kenya and Tanganyika Ordinances, a native means 'a native of Africa, not of European or Asiatic origin, and

¹ *Laws*, cap. 85, Third Schedule.

includes a Somali or Swahili';¹ while the definition in the Nyasaland Order in Council of 1936 is 'a native of the Protectorate not being of European or Asiatic race or origin'. In the southern provinces of Nigeria an alien is any person who is not a native of Nigeria;² in the northern provinces of Nigeria a native means a person whose ancestors were members of any tribe indigenous to the northern provinces,³ and a similar provision applies in the northern territories of the Gold Coast;⁴ in Sierra Leone the definition of native includes 'persons of African birth who are entitled by native customs to rights in land in the colony or Protectorate'.⁵

II. PRIVATE RIGHTS IN LAND

(a) *Native Land Tenure*

A different series of problems has now to be considered, connected not with the use by states of their powers of control over land, but with the evolution of native land custom in response to new economic conditions. The regulation of such matters as the inheritance of land, or the distribution of vacant land when required for fresh cultivation, has for the most part remained within the field of native customary law, and it is only in certain areas, such as the Gold Coast, that it has been to any extent brought within the orbit of the judicial courts acting under statutory law. But questions now tend more and more to emerge in which the administration has to concern itself. Disputes over rights in land come up increasingly on appeal or revision from native courts,⁶ and as a result there is gradually being evolved in different areas a case law supplementing or modifying local custom regarding land. Special processes, either executive or semi-judicial, as, for instance, the reference to the judicial committee of the provincial councils in the Gold Coast, are being adopted to define the boundaries of the jurisdiction exercised by chiefs, and special problems are arising in some of the British areas from the fact that native authorities are being given powers to make rules defining

custom,¹ which have in some cases already resulted in modifying the native custom regarding land. A typical case is the series of rules made by the native authority in the Bukoba district of Tanganyika regarding the *nyarubanja* tenures. In some areas land custom is changing rapidly under the influence of new conditions, such as the increase of the pressure of population or the spread of a market economy. These changes will eventually involve official intervention, both legislative and executive, in a more direct form than has hitherto been contemplated; the need must, for example, be envisaged for the definition and recording of title, for the regulation of lease or tenancy conditions, and for limiting the right to raise credit on land. Problems of this class have already begun to emerge in certain areas, but they are likely in future to become of more general interest and of greater urgency.

The customs which regulate the use of land in Africa are of great diversity, and generalizations are perhaps apt to be more misleading here than in any other field. The effects of physical and economic environment write themselves more readily on land custom than on any other form of social observance, and not only is there great variety of such environment in Africa, but the ebb and flow of migration has tended to prevent the stabilization of custom in regard to land. We have now not merely the variety of land-holding custom incidental to the different uses to which land is put, such, for instance, as the collection of forest produce, pasturage, cultivation as an aid to animal husbandry, or cultivation as a primary industry, but we are beginning to see new varieties of custom created by the growth of more intensive systems of cultivation, and by the fact that, in some areas at least, land is beginning to acquire a commercial value. There are, however, certain common features which seem to be fundamental to most customary systems of land tenure in Africa. Rights to land have the character of a privilege based on membership of a community, entitling every member to the beneficial use of the community lands, whether for grazing, hunting, collecting fruits, or cultivating, rather than of a right over specific areas identified with the holder.

¹ See, for instance, the Native Law Ordinance, *Laws of Uganda*, cap. 62; and Chap. IX, pp. 391, 429.

In the simpler African societies the claim for land for a house, and for cultivation and grazing of stock, is founded on the membership of a kindred group, a clan or subdivision of a clan, whose ancestors are believed to have been the first occupiers of the common lands. The heads of the group are responsible for the allocation of the land, and sometimes also for the religious ceremonies necessary to secure the blessings of ancestors on crops and herds. Among the nomad Bushmen each family has its own hunting ground and the penalty for intrusion might be death at the hands of the traditional right-holders. Where population is sparse and whole villages move as the soil becomes exhausted, land rights take the form of a recognition that a given tract of land is at the disposal of each village group; land allocated to different families by heads of groups remains in their undisturbed possession so long as they make beneficial use of it. The produce of the land is the exclusive possession of the family cultivating it. These conditions still prevail, for instance, among tribes such as those of northern Nyasaland, Northern Rhodesia, the southern part of the Belgian Congo, or tribes in northern Uganda.

Where conditions are more stable, and the village site is more or less permanent, and where cultivation, even when the shifting system is followed, is carried on within an area never altogether abandoned, allotments of land to family units are more definite; they are now made so far as possible on a scale which will permit of the polygamous family extending its cultivation as the number of wives increases, and of allowing married sons to set up house on their father's land. The land allotted passes normally by inheritance, under a variety of well established but often complex systems. Where the allotment has not made sufficient provision for the next generation, some members must in turn apply for land to the group heads, who have the right to resume and re-allot land once cleared which has gone out of cultivation. As the density of population increases and the area of virgin soil grows less, the number of persons who have new land to administer naturally grows smaller and smaller. This describes generally the position among such tribes as the Chaga of Tanganyika, the Kikuyu and Kavirondo of Kenya, the Thonga of Portuguese East Africa, the Tswana of the Bechuanaland Protectorate, or many of

the tribes of the southern provinces of Nigeria or on the French West Coast.
